CITY OF OREGON CITY
PLANNING COMMISSION
REVISED AGENDA

Hanlon Commission Chambers, Libke Public Safety Facility, 1234 Linn Ave, Oregon City
Monday, April 13, 2026 at 7:00 PM

Ways to participate in this public meeting:

- *Attend in person, location listed above. Please see the public comment guidelines below.*
- *Attend the livestream of the meeting on the City's YouTube Channel: https://www.youtube.com/user/CityofOregonCity*
- *Register to provide electronic testimony (email ocplanning@orcity.org or call 503-722-3789 by 3:00 PM on the day of the meeting to register)*
- *Email ocplanning@orcity.org (deadline to submit written testimony via email is 3:00 PM on the day of the meeting)*
- *Mail to City of Oregon City, Attn: City Recorder, P.O. Box 3040, Oregon City, OR 97045*

1. CONVENE MEETING AND ROLL CALL

2. PUBLIC COMMENTS

Please see the public comment guidelines below.

3. PUBLIC HEARINGS

a. GLUA-26-00001/WRG-26-00001 - 807 Main Street.
Review and approval of the Willamette River Greenway criteria for a proposed 83,000 square foot mixed-use development. The Site Plan and Design Review for the proposed development will occur as a Type II Administrative review upon completion of the Type III Planning Commission review of the Willamette River Greenway Overlay District.

b. GLUA-25-00025: CU-25-00001, MAS-25-00001, PARK-25-00001-1367 Molalla Ave. Masterplan General Development Plan Approval, Conditional Use Approval for Drive-Through Uses, Maximum Parking Adjustment

c. GLUA-25-00025: MAS-25-00002, GEO-25-00007, NROD-25-00012-1367 Molalla Ave -Detailed Development Review (DDP) for the construction of a new public road (Parcel C)

d. GLUA-24-SUB-24-03-GEO-24-07-NROD-24-032 - Request for continuation of the Park Place II Subdivision Proposal.

e. *Request for Continuance to April 27, 2026: GLUA-25-057 / CU-25-02 / SP-25-0145 / PI-25-08 / PARK-25-02 - PGE Line Center Expansion*

4. COMMUNICATIONS

5. ADJOURNMENT

PUBLIC COMMENT GUIDELINES

Complete a Comment Card prior to the meeting and submit it to the clerk. When the Chair calls your name, proceed to the speaker table, and state your name and city of residence. Each speaker is given 3 minutes to speak. As a general practice, the committee does not engage in discussion with those making comments.

Complaints shall be addressed at the department level prior to addressing the committee.

ADA NOTICE

The location is ADA accessible. Hearing devices may be requested from the City Recorder prior to the meeting. Individuals requiring other assistance must make their request known 48 hours preceding the meeting by contacting the City Recorder's Office at 503-657-0891.

Agenda Posted at City Hall, Pioneer Community Center, Library, City Website.

Video Streaming & Broadcasts: The meeting is streamed live on the Oregon City's website and available on demand following the meeting. The meeting can be viewed on Willamette Falls Television channel 28 for Oregon City area residents as a rebroadcast. Please contact WFMC at 503-650-0275 for a programming schedule.

CITY OF OREGON CITY

Staff Report

To:	Planning Commission	**Agenda Date:**	April 13, 2026
From:	Christina Robertson-Gardiner, Senior Planner		

SUBJECT:
Item 3.a. - GLUA-26-00001/WRG-26-00001 - 807 Main Street.
Review and approval of the Willamette River Greenway criteria for a proposed 83,000 square foot mixed-use development. The Site Plan and Design Review for the proposed development will occur as a Type II Administrative review upon completion of the Type III Planning Commission review of the Willamette River Greenway Overlay District.

STAFF RECOMMENDATION:
Staff recommends conditional approval of the application. This application was rescheduled from the March 9, 2026, Planning Commission Meeting, which was canceled due to a lack of quorum.

EXECUTIVE SUMMARY:
The intent of the Willamette River Greenway is to protect and enhance the natural, scenic, historical, and recreational resources along the Willamette River. It aims to ensure that development in the area is compatible with the river's ecological health and promotes public access to the waterfront. The greenway seeks to preserve the river's natural landscape, provide recreational opportunities, and maintain environmental quality while accommodating responsible and sustainable development along the riverfront. Goal 15 requires that “lands committed to urban uses within the Greenway” shall be permitted to continue as urban uses, including commercial and residential uses. The city has adopted measures to implement Goal 15 in OCMC 17.48.

The development is located within 150 feet of the ordinary low-water line of the Willamette River, which requires the review to be conducted by the Planning Commission through a Type III land-use process. The current setback from the low water line, as outlined by the Oregon Department of State Lands, is 116 feet, following the terrain up the steep hill on the building's north side. Oregon City has not adopted a specific Greenway setback; instead, it employs the Type III review process for proposals and assigns a site-specific setback to meet the overlay district approval standards. In this case, the development proposal remains within the existing courthouse footprint and will include a public access easement to accommodate a future public project listed in the Transportation System Plan (TSP), along with native landscaping along the basalt edge.

The applicant plans to address the Willamette River Greenway issue before submitting the Type II Site Plan and Design Review, which will also include other overlay districts, such as natural resources, flood management, and geologic hazards/steep slopes, for review.

Clear and Objective Standards for Housing and Approach to Review

As a preliminary matter, staff wishes to note that because this development proposes housing, it is subject to the requirement in ORS 197A.400 that the city apply only clear and objective standards, conditions, and procedures. However, an applicant always has the option of proceeding to gain approval of a proposed housing development under a non-"clear and objective" track. The applicant is seeking approval of Willamette River Greenway compatibility standards, and understands and recognizes the city's values embedded in the Willamette River Greenway standards in OCMC 17.48, even though those standards may not qualify as "clear or objective."

Because the applicant has requested a Willamette River Greenway approval and asserts that it meets the standards, staff has evaluated the proposal against the criteria and determined that the proposal can meet these standards, subject to conditions related to public access easements to allow for any future public access project along McLoughlin Blvd and the planting of native landscaping at the basalt edge.

BACKGROUND:

Please refer to the attached staff report for additional background.

OPTIONS:

BUDGET IMPACT:

1. Approve the proposal with conditions (staff recommendation)
2. Approve the proposal with modified conditions and provide revised findings
3. Deny the proposal and provide revised findings.
4. Continue the hearing and request more information

TYPE III STAFF RECOMMENDATION

February 27, 2026

FILE NUMBER: GLUA-26-00001/WRG-26-00001

APPLICANT: Seth Henderson, Managing Member | Level OCC-01 LLC
7327 SW Barnes #523, Portland, OR 97225

OWNER: Clackamas County
2051 Kaen Rd, Ste 450
Oregon, City, OR 97045

Application Submitted: 01/05/2026
Application Complete: 01/23/2026
120-Day Decision Deadline: 05/23/2026

REQUEST: Review and approval of the Willamette River Greenway criteria for a proposed 83,000 square foot mixed-use development with ground-floor retail and 84 apartments with amenities, support spaces, and off-street parking. The development is located within 150 feet of the ordinary low water line of the Willamette River, which requires a Type III Willamette River Greenway Compatibility Review. The Site Plan and Design Review for the proposed development will occur as a Type II Administrative review upon completion of the Type III Planning Commission review of the Willamette River Greenway Overlay District.

LOCATION: 807 MAIN ST
OREGON CITY OR 97045
2-2E-31AB-04400

REVIEWER: Christina Robertson-Gardiner, Senior Planner AICP

ZONING: Mixed Use Downtown (MUD)

DECISION: Approval with Conditions

PROCESS: Type III decisions involve the greatest amount of discretion and evaluation of subjective approval standards, yet are not required to be heard by the city commission, except upon appeal. Applications evaluated through this process include conditional use permits, Willamette River Greenway Compatibility reviews, and similar applications. The process for these land use decisions is controlled by ORS 197.797. Notice of the application and the planning commission hearing is published and mailed to the applicant, recognized neighborhood association and

property owners within three hundred feet of the subject property. Notice must be issued at least twenty days pre-hearing, and the staff report must be available at least seven days pre-hearing. At the evidentiary hearing held before the planning commission, all issues are addressed. The decision is final unless appealed. The decision of the planning commission is appealable to the city commission within fourteen days of the issuance of the final decision. The city commission hearing on appeal is on the record and no new evidence shall be allowed. Only those persons or a city-recognized neighborhood association who have participated either orally or in writing have standing to appeal the decision of the planning commission. Grounds for appeal are limited to those issues raised either orally or in writing before the close of the public record. A city-recognized neighborhood association requesting an appeal fee waiver pursuant to OCMC 17.50.290.C must officially approve the request through a vote of its general membership or board at a duly announced meeting prior to the filing of an appeal. The city commission decision on appeal from the planning commission is the city's final decision and is appealable to the Land Use Board of Appeals (LUBA) within twenty-one days of when it becomes final.

MUNICIPAL CODE CHAPTERS

CHAPTER 17.48 WRG WILLAMETTE RIVER GREENWAY OVERLAY DISTRICT

CHAPTER 17.50 ADMINISTRATION AND PROCEDURES

Conditions of Approval
Planning File GLUA-26-00001/WRG-26-00001

(P) = Verify that condition of approval has been met with the Planning Division.
(DS) = Verify that condition of approval has been met with the Development Services Division.
(B) = Verify that condition of approval has been met with the Building Division.
(F) = Verify that condition of approval has been met with Clackamas Fire Department.

<u>The applicant shall fulfill the following conditions prior to issuance of a Certificate of Occupancy associated with the proposed application.</u>

1. The applicant shall ensure that the following items are incorporated in a Type II Site Plan and Design Review submittal for the subject site and are completed before obtaining a Certificate of Occupancy for any approved new structures on-site.
    a. The existing basalt bank at the rear of the property consists of various scrub vegetation and invasive species such as Himalayan blackberry. As part of any future development, the applicant shall submit a landscape plan that incorporates native landscaping along the rear edge of the lot (approximately 3,800 sq feet) and removes all invasive species on-site. Native landscaping shall be varied and include vertical and horizontal elements, as appropriate for the on-site soil conditions. The landscaping plan shall provide planting that provides full coverage within 5 years. (P)
    b. Pedestrian access to and along the river (17.48.100.B.2) will be provided by public access easements and any needed construction and access for maintenance

easements that follow the alignment of the adopted McLoughlin Blvd Enhancement Plan: Phase 3. (DS)

2. Review for compliance with the Natural Resources Overlay District requirements of OCMC 17.49 and the Flood Management Overlay Requirements of OCMC17.42 are required and will be submitted concurrently with the Type II Site Plan and Design Review application (P)

Staff Summary

The intent of the Willamette River Greenway is to protect and enhance the natural, scenic, historical, and recreational resources along the Willamette River. It aims to ensure that development in the area is compatible with the river's ecological health and promotes public access to the waterfront. The greenway seeks to preserve the river's natural landscape, provide recreational opportunities, and maintain environmental quality while accommodating responsible and sustainable development along the riverfront. Goal 15 requires that "lands committed to urban uses within the Greenway" shall be permitted to continue as urban uses, including commercial and residential uses. The city has adopted measures to implement Goal 15 in OCMC 17.48.

The development is located within 150 feet of the ordinary low-water line of the Willamette River, which requires the review to be conducted by the Planning Commission through a Type III land-use process. The current setback from the low water line, as outlined by the Oregon Department of State Lands, is 116 feet, following the terrain up the steep hill on the building's north side. Oregon City has not adopted a specific greenway setback; instead, it employs the Type III review process for proposals and assigns a site-specific setback to meet the overlay district approval standards. In this case, the development proposal remains within the existing courthouse footprint and will include a public access easement to accommodate a future public project listed in the Transportation System Plan (TSP), along with native landscaping along the basalt edge.

The applicant plans to address the Willamette River Greenway issue before submitting the Type II Site Plan and Design Review, which will also include other overlay districts, such as natural resources, flood management, and geologic hazards/step slopes, for review.

Clear and Objective Standards for Housing and Approach to Review
As a preliminary matter, staff wishes to note that because this development proposes housing, it is subject to the requirement in ORS 197A.400 that the city apply only clear and objective standards, conditions, and procedures. However, an applicant always has the option of proceeding to gain approval of a proposed housing development under a non-"clear and objective" track. The applicant is seeking approval of Willamette River Greenway standards compatibility, and understands and recognizes the city's values embedded in the Willamette River Greenway standards in OCMC 17.48, even though those standards may not qualify as "clear or objective."

Because the applicant has requested a Willamette River Greenway approval and asserts that it meets the standards, staff has evaluated the proposal against the criteria and determined that the proposal can meet these standards, subject to conditions related to public access easements to allow for any future public access project along McLoughlin Blvd and the planting of native landscaping at the basalt edge.

I. BACKGROUND:

1. Existing Conditions

The c.1936 Clackamas County Courthouse was recently vacated by Clackamas County upon completion of a new courthouse on the Clackamas County's Red Soils campus on Kaen Road. The County is currently in contract with the applicant to redevelop the site with a mixed-use development. The property is zoned Mixed-Use Downtown (MUD) and is located within the Downtown Design district, which limits the height of new buildings to be no taller than the neighboring Masonic Temple Building (58 feet).

The applicant is also in negotiations with the City of Oregon City to dedicate Liberty Plaza, an open space created by the County in the early 2000s on the site of the demolished Liberty Theater, to the city. None of Liberty Plaza is located within the 150-foot compatibility area, and has not been analyzed as part of a Willamette Greenway public access component.

Willamette River Greenway Review

The proposed development is 116 feet from the ordinary low waterline, which is located under the Highway 99E/McLoughlin Blvd Viaduct (Figure 6). Therefore, per OCMC 17.48**,** a Type III Compatibility Review is required for any development within 150 feet of the ordinary low waterline. Once the applicant has completed the Willamette River Greenway review with the Planning Commission, they will submit for development review through the Type II Site Plan and Design Process.

Historic Status

The courthouse is not locally designated as a local historic resource subject to OCMC 17.40 Historic Overlay District, though it has been identified as potentially eligible for listing on the National Register of Historic Places, as shown in the 2000 city survey (Exhibit 4). The finding of potential eligibility was made during a reconnaissance survey and does not convey any local control of the resource. Demolition of the courthouse will be reviewed under a Type I Administrative Review, separate from this Willamette River Greenway application. The Planning Commission should evaluate the Greenway application based on the proposed mixed-use development, not on the existing courthouse building.

As a public owner, the county is working closely with the Oregon State Historic Preservation Office to ensure that it follows ORS 356.653 (Exhibit 6), which requires public entities that own buildings listed on the National Register of Historic Places, or eligible for listing, to perform an alternative analysis, public outreach, and proportional mitigation for any adverse effect on the resource. This review is performed outside of the local land use process.

McLoughlin Blvd Enhancement-Phase 3: 10th Street to tumwata village

ODOT project name: (Willamette Falls Path/OR99E Enhance: 10th St - Railroad Ave

The last and most complex phase of Oregon City's McLoughlin Boulevard Enhancement Plan was added to the Oregon City Transportation Plan in 2024 (Ordinance No. 24-1014).

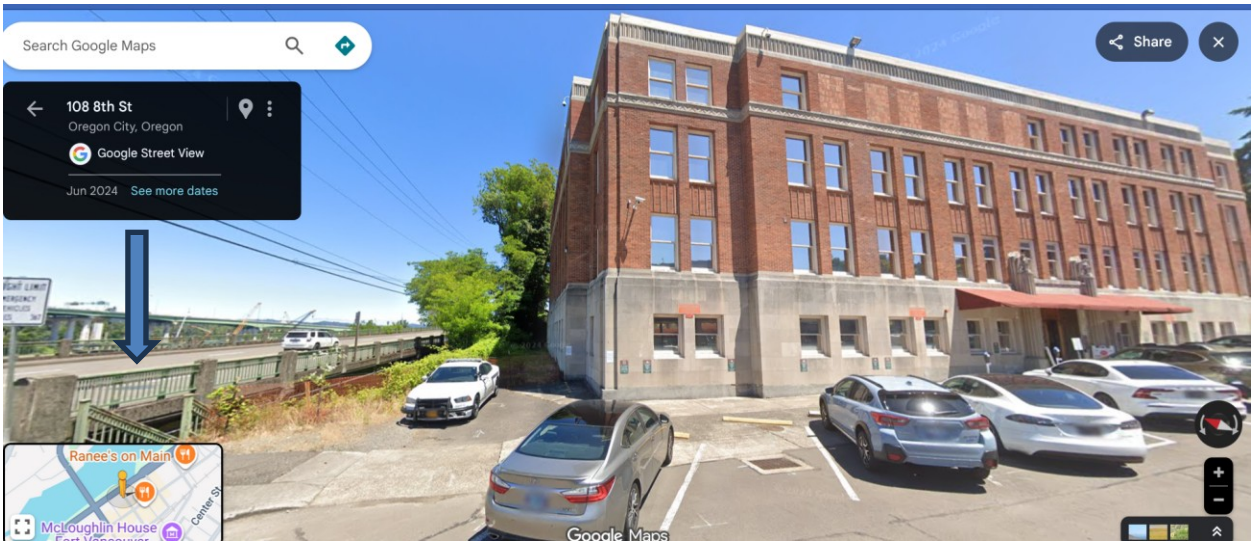
This ODOT project looked at alternatives for providing public access along the river in an area of tight constraints. The adopted alternative uses a stand-alone structure parallel to McLoughlin Blvd/99E. At the subject site, the plan envisions an under-ramp crossing (at the location of the existing ODOT stairs) to access a future dock. The adopted plan assumed the existing Courthouse footprint in its space analysis. The proposed new mixed-use development's foundation footprint does not extend closer to the river than the existing courthouse, and the 5-foot cantilevered upper floor does not encroach on any vertical access needs. Figure 1 of the staff report provides an applicant submittal of a side view of the proposed building, including the existing Mcloughlin Blvd viaduct and the proposed undercrossing ramp, to show compliance with the adopted TSP project and demonstrate that the proposed elevation will not encroach on any future public access projects in the area. The applicant supports establishing a public access easement on the property to ensure public access when any public access project is built.

Figure 1 Conceptual Rendering of 8th Street Undercrossing (McLoughlin Blvd Enhancement (Phase 3)- Courthouse identified with blue arrow.

Site Details

Figure 2: Vicinity Map/Existing Conditions – Aerial Image

Figure 3: Street View (Main Street)



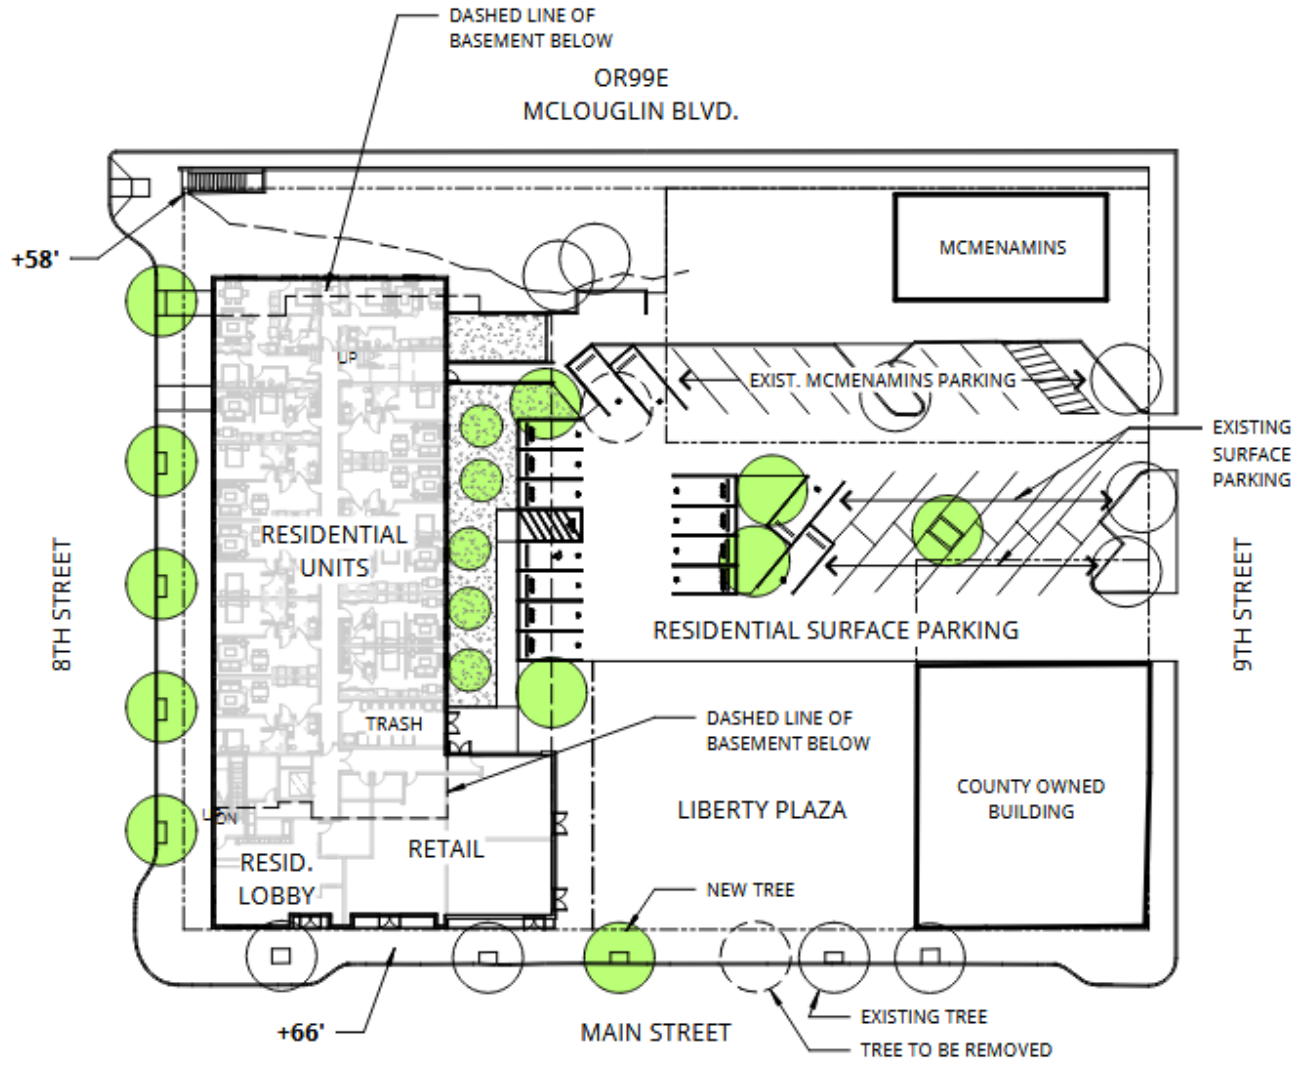


Figure 4: Street View (8th Street& McLoughlin Blvd)- note the existing ODOT green stairs that currently access the Willamette River and the conceptual location of an undercrossing ramp.

2. Project Description

The applicant has requested a review and approval of the Willamette River Greenway overlay criteria. The development is a mixed-use space with ground-floor retail, 84 apartments, including a mix of studio, one-bedroom, and two-bedroom units. It also features amenities, support spaces, and off-street parking. The total proposed area is 83,000 square feet. The ground-floor retail space is 2,600 square feet and is directly adjacent to Liberty Plaza. The building is planned as a five-story wood-framed structure above a one-level, partially subterranean concrete parking garage. The proposed mixed-use building foundation is no closer to the river than the footprint of the existing Clackamas County Courthouse Building.

1 OVERALL SITE PLAN AT MAIN STREET LEVEL

1" = 40'-0"

Figure 5: Proposed Site Plan

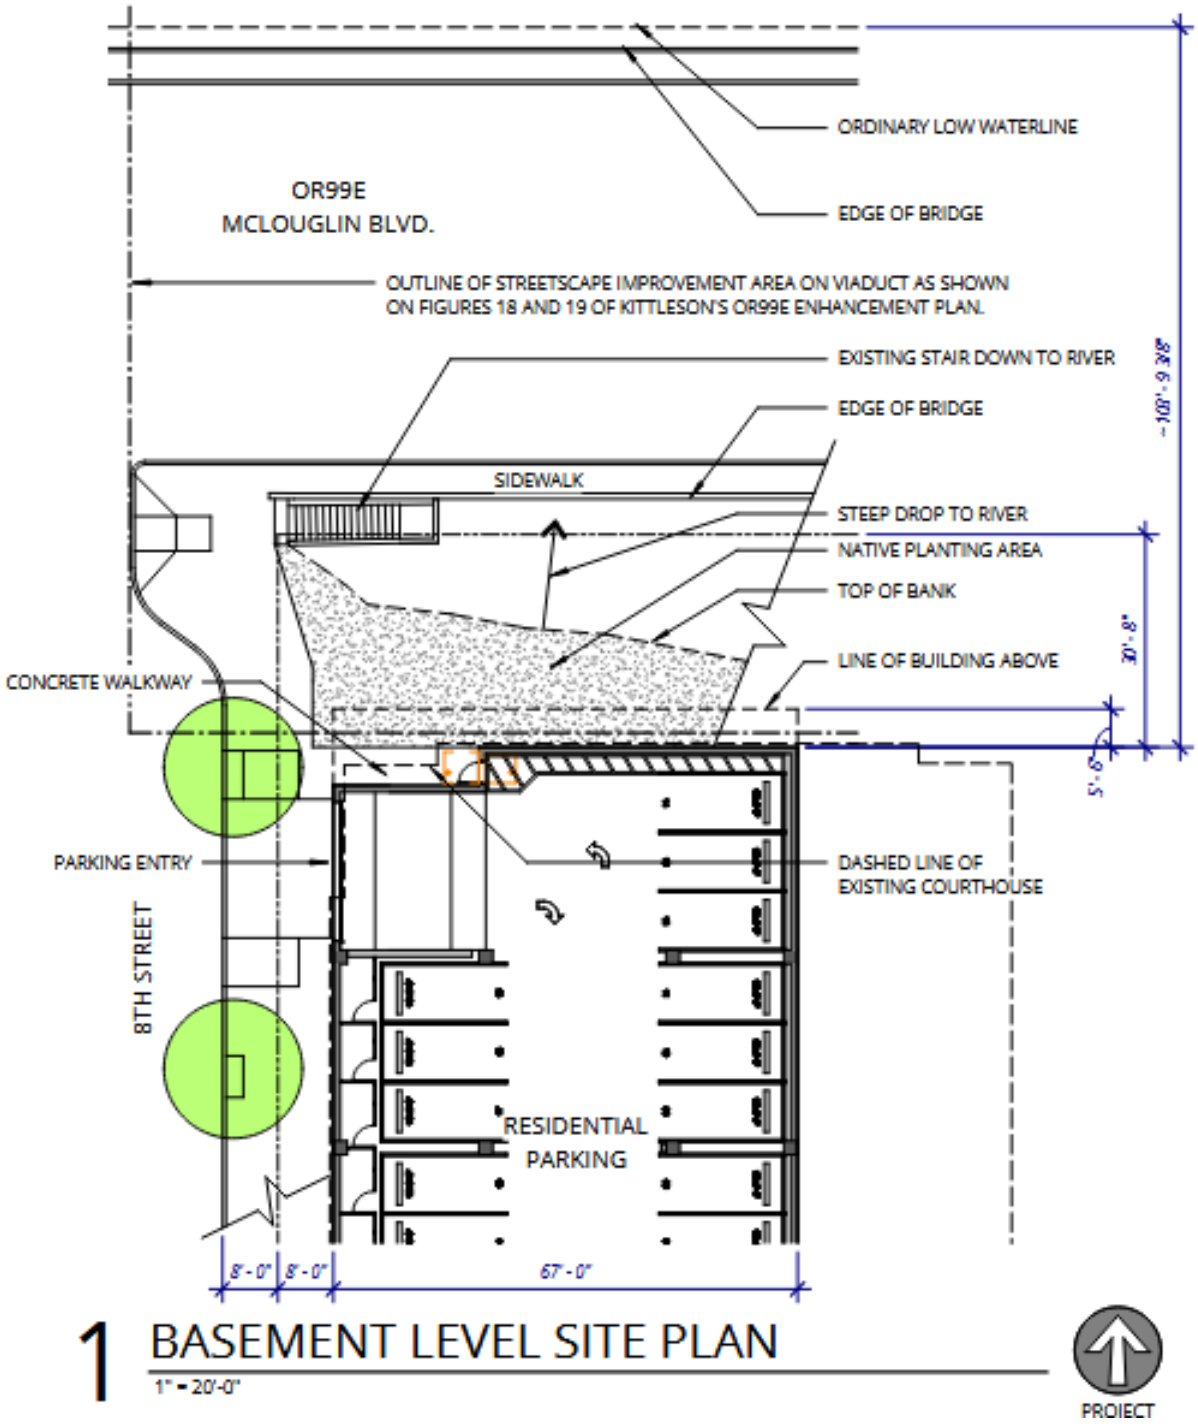

Figure 6: Proposed Basement Level Site Plan – note dashed line of existing courthouse.

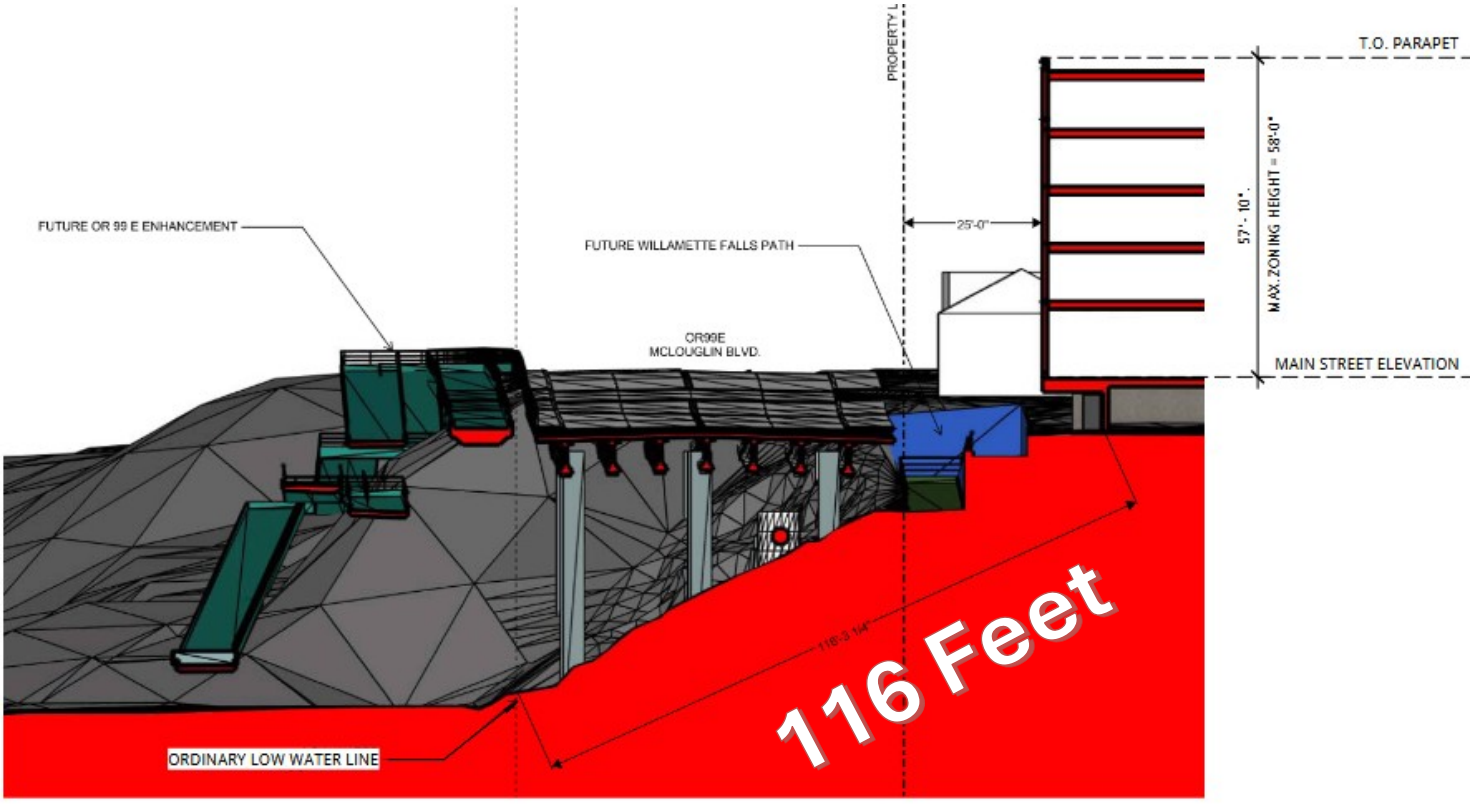

Figure 7: McLoughlin Boulevard Enhancement space analysis for anticipated public access easement. Note the 116-foot distance from the ordinary low-water line to the edge of the new construction, which shows that the property is located in the 150-foot Willamette River Compatibility areas.

3. **Permits and Approvals:** The applicant is responsible for obtaining approval and permits from each applicable governmental agency and department at Oregon City including but not limited to the Engineering and Building Divisions.

4. **Public Comment**
   Public comments submitted include (Exhibit 3):

   The applicant provided a project update to the Historic Review Board on February 24, 2026, as part of a presentation at the beginning of the meeting. As this presentation was held while the review is open for the Willamette River Greenway Review, staff has added the meeting video and agenda to the staff report as an exhibit (2a)

Melissa Gonzalez-Gabriel, OFOT Region 1, provided a comment indicating that they will be submitting formal comments during the future Type II Site Plan and Design Review and do not have any specific comment on the Willamette River Greenway application.

None of the comments provided indicates that an approval criterion has not been met or cannot be met through the Conditions of Approval attached to this Staff Report.

CHAPTER 17.34 MUD MIXED USE DOWNTOWN DISTRICT

The applicant has submitted a proposal that is permitted in the zone. Below, staff has provided a preliminary description of the submitted proposal against the underlying zone standards. The formal review of setbacks, heights, floor area ratio, and related criteria will occur at the Type II Site Plan and Design Review. Nothing in the submittal plans indicates that the applicant does not or could not meet the standards during development review.

17.34.010 Designated.

The mixed-use downtown (MUD) district is designed to apply within the traditional downtown core along Main Street and includes the "north-end" area, generally between 5th Street and Abernethy Street, and some of the area bordering McLoughlin Boulevard. Land uses are characterized by high-volume establishments constructed at the human scale such as retail, service, office, multi-family residential, lodging or similar as defined by the Community Development Director. A mix of high-density residential, office and retail uses are encouraged in this district, with retail and service uses on the ground floor and office and residential uses on the upper floors. The emphasis is on those uses that encourage pedestrian and transit use. This district includes a downtown design district overlay for the historic downtown area. Retail and service uses on the ground floor and office and residential uses on the upper floors are encouraged in this district. The design standards for this sub-district require a continuous storefront façade featuring streetscape amenities to enhance the active and attractive pedestrian environment.

17.34.020 - Permitted uses.

Permitted uses in the MUD district are defined as:
A. Banquet, conference facilities and meeting rooms;
B. Bed and breakfast/boarding houses, hotels, motels, and other lodging facilities;
C. Child care centers and/or nursery schools;
D. Indoor entertainment centers and arcades;
E. Health and fitness clubs;
F. Medical and dental clinics, outpatient; infirmary services;
G. Museums, libraries and cultural facilities;
H. Offices, including finance, insurance, real estate and government;
I. Outdoor markets, such as produce stands, craft markets and farmers markets that are operated on the weekends and after six p.m. during the weekday;
J. Postal services;
K. Repair shops, for radio and television, office equipment, bicycles, electronic equipment, shoes and small appliances and equipment;
L. Multifamily residential, triplexes and quadplexes;
M. 1 or 2 units in conjunction with a nonresidential use provided that the residential use occupies no more than 50% of the total square footage of the development;

N. Restaurants, eating and drinking establishments without a drive through;
O. Services, including personal, professional, educational and financial services; laundry and dry-cleaning;
P. Retail trade, including grocery, hardware and gift shops, bakeries, delicatessens, florists, pharmacies, specialty stores provided the maximum footprint of a freestanding building with a single store does not exceed sixty thousand square feet (a freestanding building over sixty thousand square feet is allowed as long as the building contains multiple stores);
Q. Seasonal sales;
R. Residential care facilities, assisted living facilities; nursing homes and group homes for over fifteen patients licensed by the state;
S. Studios and galleries, including dance, art, photography, music and other arts;
T. Utilities: Basic and linear facilities, such as water, sewer, power, telephone, cable, electrical and natural gas lines, not including major facilities such as sewage and water treatment plants, pump stations, water tanks, telephone exchanges and cell towers;
U. Veterinary clinics or pet hospitals, pet day care;
V. Home occupations;
W. Research and development activities;
X. Temporary real estate offices in model dwellings located on and limited to sales of real estate on a single piece of platted property upon which new residential buildings are being constructed;
Y. Transportation facilities;
Z. Live/work dwellings;
AA. After-hours public parking;
BB. Marinas;
CC. Religious institutions.
DD. Mobile food units outside of the downtown design district.

Preliminary, Non-Binding Finding: Complies as proposed. The proposed development includes multi-family and retail trade, as described above as a permitted use**;** this standard is met.

17.34.030 - Conditional uses.
The following uses are permitted in this district when authorized and in accordance with the process and standards contained in OCMC 17.56.
A. Drive-through facilities;
B. Emergency services;
C. Hospitals;
D. Outdoor markets that do not meet the criteria of OCMC 17.34.020.I.;
E. Parks, playgrounds, play fields and community or neighborhood centers;
F. Parking structures and lots not in conjunction with a primary use on private property, excluding after-hours public parking;
G. Retail trade, including grocery, hardware and gift shops, bakeries, delicatessens, florists, pharmacies and specialty stores in a freestanding building with a single store exceeding a foot print of sixty thousand square feet;
H. Public facilities such as sewage and water treatment plants, water towers and recycling and resource recovery centers;
I. Public utilities and services such as pump stations and sub-stations;
J. Distributing, wholesaling and warehousing;
K. Gas stations;

L. Public and or private educational or training facilities;
M. Stadiums and arenas;
N. Passenger terminals (water, auto, bus, train), excluding bus stops;
O. Recycling center and/or solid waste facility;
P. Shelters, except within the Downtown Design District.

Preliminary, Non-Binding Finding: Complies as proposed. No conditional uses are proposed; these standards are not applicable to the development.

17.34.040 - Prohibited uses.
The following uses are prohibited in the MUD district:
A. Kennels;
B. Outdoor storage and sales, not including outdoor markets allowed in OCMC 17.34.030;
C. Self-service storage;
D. Single-Family detached residential units, townhouses and duplexes;
E. Motor vehicle and recreational vehicle repair/service;
F. Motor vehicle and recreational vehicle sales and incidental service;

G. Heavy equipment service, repair, sales, storage or rental2 (including but not limited to construction equipment and machinery and farming equipment);
H. Marijuana production, processing, wholesaling, research, testing, and laboratories;
I. Mobile food units within the downtown design district unless a special event has been issued.

Preliminary, Non-Binding Finding: Complies as proposed: No prohibited uses are proposed; therefore, these standards are not applicable to the development

17.34.050 - Pre-existing industrial uses.
Tax lot 5400 located at Clackamas County Tax Assessors Map #22E20DD, Tax Lots 100 and two hundred located on Clackamas County Tax Assessors Map #22E30DD and Tax Lot 700 located on Clackamas County Tax Assessors Map #22E29CB have special provisions for industrial uses. These properties may maintain and expand their industrial uses on existing tax lots. A change in use is allowed as long as there is no greater impact on the area than the existing use.

Preliminary, Non-Binding Finding: Not applicable. The site does not contain a pre-existing industrial use.

17.34.070 - Mixed-use downtown dimensional standards—For properties located within the downtown design district.
A. Minimum lot area: None.
Preliminary, Non-Binding Finding: Complies as proposed. *No minimum lot area is required; the project meets this standard as proposed.*

B. Minimum floor area ratio: 0.5.
Preliminary, Non-Binding Finding: Complies as proposed. The proposed FAR is 1.64:1; therefore, the minimum standard is met. The final review of this standard will occur with the Type II Site Plan and Design Review.

C. Minimum building height: Twenty-five feet or two stories except for accessory structures or buildings under one thousand square feet.
Preliminary, Non-Binding Finding: Complies as proposed. The building is planned as a five-story wood-framed structure above a one-level, partially subterranean concrete parking garage. Therefore, the project meets this standard as proposed. The final review of this standard will occur with the Type II Site Plan and Design Review.

D. Maximum building height: Fifty-eight feet.
Preliminary, Non-Binding Finding: Complies as proposed. The applicant has indicated that the building will not exceed 58' and is currently designed at 57' from the average grade along Main Street, the project meets this standard as proposed. The final review of this standard will occur with the Type II Site Plan and Design Review.

E. Minimum required setbacks, if not abutting a residential zone: None.
F. Minimum required interior and rear yard setback if abutting a residential zone: Twenty feet, plus one foot additional yard setback for every three feet in building height over thirty-five feet.
Preliminary, Non-Binding Finding: Complies as proposed. *The project does not affect a residential zone.*

G. Maximum Allowed Setbacks.
1. Front yard setback: Ten feet.
Preliminary, Non-Binding Finding: Complies as proposed. *The project proposes a zero-foot front yard setback, which meets the maximum allowed setback standard.* The final review of this standard will occur with the Type II Site Plan and Design Review.

2. Interior side yard setback: No maximum.
Preliminary, Non-Binding Finding: Complies as proposed. *The applicant indicated that due to Liberty Plaza and the existing parking lot, the interior side yard setback is set back extensively from 9th Street. Provided there is no maximum setback at interior side yards, the project meets this standard as proposed.* The final review of this standard will occur with the Type II Site Plan and Design Review.

3. Corner side yard setback abutting street: Ten feet.
Preliminary, Non-Binding Finding: Complies as proposed. The setback along 8th Street is 8'; therefore, this standard is met. The final review of this standard will occur with the Type II Site Plan and Design Review.

4. Rear yard setback: No maximum.
5. Rear yard setback abutting street: Ten feet. Public utility easements may supersede the minimum setback. Maximum setback may be increased per OCMC 17.62.055.D

Preliminary, Non-Binding Finding: Not Applicable. The rear yard does not directly abut the Highway 99E Viaduct bridge because there is no direct access and the property line is approximately five feet from the bridge; therefore, this standard is not applicable. The final review of this standard will occur with the Type II Site Plan and Design Review.

H. Maximum site coverage of the building and parking lot: Ninety-five percent.

Preliminary, Non-Binding Finding: Complies as proposed. The proposed site coverage is 79.5%, therefore, this standard is met. The final review of this standard will occur with the Type II Site Plan and Design Review.

I. Minimum landscape requirement (including parking lot): 5 percent.

Preliminary, Non-Binding Finding: Complies as proposed. The proposed landscape coverage is 20.5%, therefore, this standard is met. The final review of this standard will occur with the Type II Site Plan and Design Review.

J. Residential minimum net density of 17.4 units per acre, except that no minimum net density shall apply to residential uses proposed above nonresidential uses in a vertical mixed-use configuration or to live/work dwellings.

Preliminary, Non-Binding Finding: Not Applicable. No minimum density is required as residential uses are proposed over nonresidential uses in a vertical mixed-use configuration, therefore the standard is not applicable.

K. Standalone residential development of fewer than five units are exempt from maximum setbacks of the underlying zone.

Preliminary, Non-Binding Finding: Not Applicable. The project is proposed to contain 84 units; therefore, this standard is not applicable.

17.34.080 - Explanation of certain standards.
A. Floor Area Ratio (FAR).
1. Purpose. Floor area ratios are a tool for regulating the intensity of development. Minimum FARs help to achieve more intensive forms of building development in areas appropriate for larger-scale buildings and higher residential densities.
2. Standards.
a. The minimum floor area ratios contained in OCMC 17.34.060 and 17.34.070 apply to all non-residential and mixed-use building developments.

b. Required minimum FARs shall be calculated on a project-by-project basis and may include multiple contiguous blocks. In mixed-use developments, residential floor space will be included in the calculations of floor area ratio to determine conformance with minimum FARs.
c. An individual phase of a project shall be permitted to develop below the required minimum floor area ratio provided the applicant demonstrates, through covenants applied to the remainder of the site or project or through other binding legal mechanism, that the required density for the project will be achieved at project build out.

B. Building height.
1. Purpose.

a. The Masonic Hall is currently the tallest building in downtown Oregon City, with a height of fifty-eight feet measured from Main Street. The maximum building height limit of fifty-eight feet will ensure that no new building will be taller than the Masonic Hall.
b. A minimum two-story (twenty-five feet) building height is established for the Downtown Design District Overlay sub-district to ensure that the traditional building scale for the downtown area is maintained.

II. ANALYSIS AND FINDINGS:

Municipal Code Standards and Requirements: The following sections of the Oregon City Municipal Code are applicable to this land use approval:

CHAPTER 17.48 WRG WILLAMETTE RIVER GREENWAY OVERLAY DISTRICT

17.48.010 - Designated.
This chapter shall apply to all development, changes of use or intensification of use in that area designated WRG Willamette River Greenway on a special city zoning map.

17.48.020 - Purpose.
The purpose of this chapter is to:
A. Protect, conserve, enhance and maintain the natural scenic, historical, agricultural, economic and recreational qualities of land along the Willamette River;
B. Maintain the integrity of the Willamette River by minimizing erosion, promoting bank stability and maintaining and enhancing water quality and fish and wildlife habitats;
C. Implement the Willamette River Greenway goal and the Willamette River Greenway portions of the City comprehensive plan.

17.48.040 - Uses allowed.
All uses permitted pursuant to the provisions of the underlying zoning district are permitted on lands designated WRG; provided, however, that any development, change of use or intensification of use shall be subject, in addition to the provisions of the underlying district, to the provisions of this chapter.

Finding: Complies as proposed. The proposed project meets the provisions of the underlying zoning district and allowed uses; this standard is met.

17.48.050 - Permit required—Exceptions.
A Willamette River Greenway permit shall be required for all developments and changes or intensification of uses, except the following:
A. The propagation of timber or the cutting of timber for public safety or personal use, except the cutting of timber along the natural vegetative fringe along the river;
B. Gravel removal from the bed of the Willamette River when conducted under a permit from the state;
C. Customary dredging and channel maintenance;
D. Placing by a public agency of signs, markers, aids and similar structures to serve the public;
E. Activities to protect, conserve, enhance and maintain public recreation, scenic, historical and natural uses on public lands;

F. Acquisition and maintenance of scenic easements by the Oregon Department of Transportation;
G. Partial harvesting of timber shall be permitted beyond the natural vegetative fringe and those areas not covered by a scenic easement and when the harvest is consistent with an approved plan under the Oregon Forest Practices Act. Commercial forest activities and harvesting practices providing for vegetative buffers, shading, soil stabilization, and water filtering effects required under the Oregon Forest Practices Act;
H. The use of a small cluster of logs for erosion control;
I. The expansion of capacity or the replacement of existing communication or energy distribution and transmission systems, except utility sub-stations;
J. The maintenance and repair of existing flood control facilities;
K. Any activity subject to Type I review pursuant to OCMC 17.62.035.A.2, provided that proposed changes are located entirely outside of the compatibility boundary and on existing developed commercial, multifamily, or industrial properties.
L. Within the compatibility boundary, exterior building changes that are not considered remodeling.
M. Changes to landscaping or parking subject to Type I review pursuant to OCMC 17.62.035.A.2 that are more than 100 feet from the Oregon Department of State Lands' mapped ordinary low water line of the Willamette River, provided that changes are located on existing developed commercial, multifamily, or industrial properties.
N. On existing single or two-family residential properties, landscaping, construction of driveways, modification of existing structures or construction or placement of such subsidiary structures or facilities adjacent to the residence.
O. The addition of a wall sign, projecting sign, or roof sign on any building in the WRG overlay.

Finding: Complies as proposed. The proposed project does not meet any of the listed exceptions; therefore, a permit will be required

17.48.060 - Procedures.
Except as specifically provided for in Section 17.48.100, the procedure for action on a Willamette River Greenway permit shall be as provided for under the Type II review provisions in OCMC 17.50.

17.48.070 - Development standards—Specific use.
In approving any development or change or intensification of use, the approving officer or body shall apply the following standards:
Considerations for Specific Uses.
A. With respect to recreational uses only: the considerations set forth in section C.3.b of Goal 15.
B. With respect to those fish and wildlife habitats identified in the City comprehensive plan only: the considerations set forth in section C.3.d. of Goal 15.
C. With respect to those scenic qualities and views identified in the City comprehensive plan only: the considerations set forth in section C.3.e. of Goal 15.
D. With respect to timber resources only: the considerations set forth in section C.3.h. of Goal 15.
E. With respect to aggregate extraction only: the considerations set forth in section C.3.i. of Goal 15.

Finding: Complies as conditioned. The proposed development is a residential/commercial use and is not a recreational use, does not involve timber resources, and does not include aggregate extraction. Therefore, the considerations set forth in Goal 15 Sections C.3.b, C.3.h, and C.3.i are not applicable. The site is not identified in the Oregon City Comprehensive Plan as a designated

fish and wildlife habitat, and no such habitat is affected by the proposal; therefore, the considerations in Section C.3.d of Goal 15 are not applicable. With respect to scenic qualities and views identified in the Comprehensive Plan, the project has been designed to be compatible with the Willamette River corridor through building placement, preservation of existing vegetation, and supplemental native landscaping, consistent with the intent of Goal 15 Section C.3.e.

While the specific site has not been identified by reference or map in the city's Comprehensive Plan, the Willamette River is highlighted in numerous policies. The policies and strategies below are intended to protect public views of the Willamette River. Staff has identified two conditions of approval relating to the removal of invasive species and replanting with native species of the existing basalt bank at the northern property line, along with a public access easement to ensure adequate space and legal recourse to implement any future public access project. Nothing in the polices and strategies identified below prohibits the applicant from proposing to build a mixed-use development on the site of an existing building. The applicant is proposing to build a mixed-use development on the site of an existing building footprint. Analysis of the National Resources Overlay District (NROD) and any increase in impervious surfaces within the 200-foot NROD buffer for the Willamette River is tied to the Type II Site Plan and Design Review and will be conducted. Applicable conditions of approval will be attached to the city's decision at the time of development review.

OC2040 Protected Environment

GOAL 4
Ensure the environmental and economic health of the Willamette River Greenway (WRG) as a key feature of Oregon City and the broader region

> POLICY 4.1 Protect the significant fish and wildlife habitat of the Willamette River by maximizing the preservation of trees and vegetative cover.
> **POLICY 4.2 Preserve major scenic views, drives and sites of the WRG.**
> POLICY 4.3 Encourage access to and along the river consistent with the Oregon City Park and Recreation Master Plan.
> POLICY 4.4 Restrict new substations and power line towers in the WRG and river view corridor.
> POLICY 4.5 Protect and maintain parks and recreation areas and facilities along the Willamette River to minimize effects in the WRG, in accordance with the Oregon City Park and Recreation Master Plan.

Requiring an additional setback to what is proposed does not significantly enhance habitat protection for the Willamette River within this urban context. The applicant is following the existing footprint of the courthouse foundation and has proposed a thinner building that will not affect any existing views of the Willamette River. The applicant's plan, combined with approval conditions, strikes an appropriate balance between supporting ongoing urban development and safeguarding public access and habitat along the Willamette River.

Proposed conditions:
The existing basalt bank at the rear of the property is covered with various scrub vegetation and invasive species, including Himalayan blackberry. As part of any future development, the applicant

shall submit a landscape plan that incorporates native landscaping along the rear edge of the lot (approximately 3,800 sq feet) and removes all invasive species on-site. Native landscaping shall be varied and include vertical and horizontal elements, as appropriate for the on-site soil conditions. The landscaping plan shall provide planting that provides full coverage within 5 years.

Pedestrian access to and along the river (17.48.100.B.2) will be provided by public access easements and any needed construction and access for maintenance easements that follow the alignment of the adopted McLoughlin Blvd Enhancement Plan: Phase 3. (DS)

17.48.080 - Development standards—General considerations.
The following considerations shall be applicable to all Willamette River Greenway permits.
A. Access. Adequate public access to the Willamette River shall be considered and provided for.

Finding: Complies with condition. Public access to the Willamette River is addressed through site planning that preserves adequate space for future implementation of the McLoughlin Boulevard Enhancement Plan (Phase 3) (Exhibit 5), as adopted in the Transportation System Plan. While construction of these improvements is not included in this approval, the applicant acknowledges the required area and will provide a public access easement over portions of the site necessary to accommodate future public access improvements. Figure 7 of the staff report provides a three-dimensional space analysis that integrates the proposed ramp below the McLoughlin Boulevard viaduct, designed to gain access to a future 8th Street dock location, and demonstrates that there is adequate room for a future public access project to be conducted within the proposed public access easement boundary.

Pedestrian access to and along the river (17.48.100.B.2) will be provided by public access easements and any needed construction and access for maintenance easements that follow the alignment of the adopted McLoughlin Blvd Enhancement Plan: Phase 3. (DS)

B. Protection and Safety. Maintenance of public safety and protection of public and private property, especially from vandalism and trespass, shall be provided to the maximum extent practicable.

Finding: Complies. Public safety and property protection are provided through site layout, building design, lighting, and access control measures that minimize opportunities for vandalism and trespass, consistent with clear and objective development standards.

C. Vegetative Fringe. The natural vegetative fringe along the Willamette River shall be protected and enhanced to the maximum extent practicable.

Finding: Complies with condition. The project protects the existing vegetative fringe along the Willamette River and enhances it to the maximum extent practicable through preservation of existing vegetation and supplemental native planting appropriate to the existing rock outcropping and river corridor.

The existing basalt bank at the rear of the property consists of various scrub vegetation and invasive species such as Himalayan blackberry. As part of any future development, the applicant

shall submit a landscape plan that incorporates native landscaping along the rear edge of the lot (approximately 3,800 sq feet) and removes all invasive species on-site. Native landscaping shall be varied and include vertical and horizontal elements, as appropriate for the on-site soil conditions. The landscaping plan shall provide planting that provides full coverage within 5 years.

D. Directing Development Away from the River. Development shall be directed away from the Willamette River to the greatest possible degree, provided that lands committed to urban uses within the Greenway may continue as urban uses, subject to the nonconforming use provisions of Chapter 17.58 of this title.

Finding: Complies. Consistent with the Greenway standard, development is directed away from the Willamette River through the replacement of an existing building within the previously developed footprint. The proposed building is located no closer to the river and was designed to be positioned farther from the steep bank and river corridor than the existing structure by reducing the width of the new building from that of the existing courthouse.

E. A Greenway Setback. In each application, the approving officer or body shall establish a setback to keep structures separated from the Willamette River in order to protect, maintain, preserve and enhance the natural scenic, historic and recreational qualities of the Willamette River Greenway, as set forth in the City comprehensive plan; provided, however, that the requirement to establish such setbacks shall not apply to water-related or water-dependent uses. No greenway setback standards shall apply for areas outside of the 150-foot Compatibility boundary.

Finding: Complies. The current setback from the low water line (as provided by the Oregon Department of State Lands) is 116 feet, following the topography up the steep hill to the north side of the building. Oregon City has not adopted a specific greenway setback ; instead, it uses the Type III process to review proposals and provides a site-specific setback to ensure compliance with the overlay district approval criteria. In this case, the proposed development does not encroach beyond the existing courthouse footprint and will provide a public access easement to ensure that there is adequate space to construct a future public project that has been adopted into the Transportation System Plan (TSP). Therefore, staff recommends that the Planning Commission accept the site-specific approach to setbacks.

Requiring an additional setback does not provide any additional access to the Willamette River beyond what is already contemplated in the McLoughlin Blvd enhancement plan, or what exists currently with the McLoughlin Blvd enhancement plan, or what exists currently with the McLoughlin Blvd/99E ODOT structures. There is no nexus tied to an additional setback to the Willamette River for this existing urban site. The applicant's proposal, in concert with the conditions of approval for public access, provides the necessary balance between supporting existing urban development and ensuring public access to the Willamette River.

F. Other Applicable Standards. The Oregon Department of Transportation Greenway Plan, the Greenway portions of the City comprehensive plan, the Willamette River Greenway statutes and the provisions of Statewide Planning Goal 15, shall also be considered in actions involving Willamette River Greenway permits.

Finding: Complies with Conditions. The project has been reviewed for consistency with the Oregon Department of Transportation Greenway Plan, the Greenway policies of the OC2040 Comprehensive Plan, applicable Willamette River Greenway statutes, and Statewide Planning Goal 15. OC2040 recognizes the Willamette River Greenway as an important natural and scenic resource for Oregon City and establishes policies to protect and enhance this corridor, including preserving vegetated areas, scenic views, and fish and wildlife habitat, and encouraging appropriate public access consistent with local park planning. Statewide Planning Goal 15 is intended to protect, conserve, enhance, and maintain the natural, scenic, recreational, and ecological qualities of the Willamette River Greenway while allowing urban uses consistent with local plans and regulations. The proposed development is consistent with these objectives by directing development away from the river relative to existing conditions, preserving and enhancing vegetated areas within the river corridor, and accommodating future public access consistent with adopted plans.

17.48.100 - Compatibility review.
A. In all areas within one hundred fifty feet of the Oregon Department of State Lands' mapped ordinary low-water line of the Willamette River, hereinafter referred to as the "compatibility boundary," the provisions of this subsection shall be applicable to all developments and changes or intensification of uses, so as to ensure their compatibility with Oregon's Greenway statutes, and to assure that the best possible appearance, landscaping and public access be provided.

Finding: Complies. As the project is located within the 150-foot compatibility boundary, the development has been carefully designed to ensure compatibility with Oregon's Greenway statutes. Building placement, landscape treatment, and site design emphasize visual quality, protection of the river environment, and accommodation of public access consistent with applicable Greenway standards.

B. All development or changes or intensifications of uses in the compatibility area shall be approved only if the following findings are made by the Planning Commission through a Type III review process pursuant to OCMC 17.50.
1. That to the greatest extent possible, the development or change or intensification of use provides for the maximum possible landscaped area, open space or vegetation between the activity and the river.

Finding: Complies with condition. The proposed project provides the maximum practicable landscaped area and vegetation between the development and the Willamette River. A substantial existing vegetated bank between the development area and the river will be preserved and left undisturbed. In addition, the project incorporates new native landscaping between the proposed building and the top of the bank, increasing vegetative buffering relative to existing conditions. Goal 15 identifies that lands committed to urban use means those lands upon which the economic, developmental and locational factors have, when considered together, made the use of the property for other than urban purposes inappropriate.

Building placement within the previously developed portion of the site allows the majority of the river-facing area to remain in vegetated open space, thereby maximizing separation between development activity and the river corridor to the extent practicable within its urban setting.

The existing basalt bank at the rear of the property consists of various scrub vegetation and invasive species such as Himalayan blackberry. As part of any future development, the applicant shall submit a landscape plan that incorporates native landscaping along the rear edge of the lot (approximately 3,800 sq feet) and removes all invasive species on-site. Native landscaping shall be varied and include vertical and horizontal elements, as appropriate for the on-site soil conditions. The landscaping plan shall provide planting that provides full coverage within 5 years.

2. That to the greatest degree possible, necessary public access is provided to and along the Willamette River by appropriate legal means.

Finding: Complies with condition. The project provides for necessary public access to and along the Willamette River to the greatest degree practicable through appropriate legal means, including preservation of required areas and provision of public access easements consistent with future plans, including the McLoughlin Boulevard Enhancement Plan. Pedestrian access to and along the river (17.48.100.B.2) will be provided by public access easements and any needed construction and access for maintenance easements that follow the alignment of the adopted McLoughlin Blvd Enhancement Plan: Phase 3. (DS)

17.48.110 - Prohibited activities.
The following are prohibited within the Willamette River Greenway:
A. Structural bank protection, except rip rap or a channelization used as an emergency measure only to protect existing structures. Any such rip rap or channelization to stabilize undeveloped sites shall be prohibited as well;
B. Subsurface sewage disposal drain fields within one hundred feet of the ordinary mean low-water line of the Willamette River.

Finding: Complies. No activities prohibited by OCMC 17.48.110 are proposed as part of this development.

17.48.120 - Additional procedural requirements.
In addition to the requirements of Chapter 17.50, the following procedural requirements shall be applicable to all matters arising out of Sections 17.48.070 through 17.48.100:
A. Applications submitted for review under Sections 17.48.070 through 17.48.100 shall be accompanied by such materials as are reasonably necessary for adequate review, including, as necessary:
1. A site and landscaping plan showing existing vegetation and development and location of proposed development for activities;
2. Elevations of any proposed structures;
3. Materials list for any proposed structures, including type and colors of siding and roofing; and
4. Cross-sections of any area within the vegetative fringe where grading, filling, timber harvesting or excavating will occur.
Finding: Complies. A site plan is provided showing existing vegetation, the proposed building outline, and the existing footprint. Elevations and materials are not applicable to this proposal, and full cross sections are not required because there is no grading or filling within the vegetative fringe identified. A small representative cross section that includes the proposed height is shown in Figure 7, looking at the setback from the ordinary low water line.

B. Written notice, including a copy of the application, shall be sent immediately upon receipt to the Oregon Department of Transportation by certified mail, return receipt requested. The Oregon Department of Transportation shall have seven working days from the date of mailing to respond before a decision be rendered.
1. Written notice shall be given to the Oregon Department of Transportation by certified mail, return receipt requested, within seven days of the entry of a final order on the disposition of all applications made under Sections 17.48.070 through 17.48.100.

Finding: Complies. A notice was sent to the Oregon Department of Transportation via email at the time of land use transmittal, requesting confirmation of whether they wanted a final order *sent by certified mail.*

CHAPTER 17.50 – ADMINISTRATION AND PROCEDURES

17.50.010 Purpose.
This chapter provides the procedures by which Oregon City reviews and decides upon applications for all permits relating to the use of land authorized by ORS 92, 197 and 227. These permits include all form of land divisions, land use, limited land use and expedited land division and legislative enactments and amendments to the Oregon City Comprehensive Plan and Titles 16 and 17 of this code. Pursuant to ORS 227.175, any applicant may elect to consolidate applications for two or more related permits needed for a single development project. Any grading activity associated with development shall be subject to preliminary review as part of the review process for the underlying development. It is the express policy of the City of Oregon City that development review not be segmented into discrete parts in a manner that precludes a comprehensive review of the entire development and its cumulative impacts.

17.50.030 Summary of the City's decision-making processes.
The following decision-making processes chart shall control the City's review of the indicated permits:
Table 17.50.030 – Permit Approval Process

Permit Type	***I***	***II***	***III***	***IV***	***Expedited Land Division***
Compatibility review for the Willamette Greenway Overlay District			*X*		

**If any provision or element of the master plan/planned unit development requires a deferred Type III procedure, the detailed development plan shall be processed through a Type III procedure.*
C. Type III decisions involve the greatest amount of discretion and evaluation of subjective approval standards, yet are not required to be heard by the City Commission, except upon appeal. In the event that any decision is not classified, it shall be treated as a Type III decision. The process for these land use decisions is controlled by ORS 197.763. Notice of the application and the Planning Commission or the Historic Review Board hearing is published and mailed to the applicant, recognized neighborhood association(s) and property owners within three hundred feet. Notice shall be issued at least twenty days pre-hearing, and the staff report shall be available at least seven days pre-hearing. At the evidentiary hearing held before the Planning Commission or the Historic Review Board, all issues are addressed. The decision of the Planning Commission or Historic Review Board is appealable to the City Commission, on the record pursuant to OCMC

17.50.190. The City Commission decision on appeal from is the City's final decision and is subject to review by LUBA within twenty-one days of when it becomes final, unless otherwise provided by state law.

17.50.040 Development review in overlay districts and for erosion control.
For any development subject to regulation of geologic hazards overlay district under OCMC 17.44; natural resource overlay district under OCMC 17.49; Willamette River Greenway Overlay District under OCMC 17.48; historic overlay district under OCMC 17.40, and erosion and sediment control under OCMC 17.47, compliance with the requirements of these chapters shall be reviewed as part of the review process required for the underlying development for the site.

Finding: Complies. *The applicant has requested a Type III compatibility review for the Willamette River Greenway. This chapter applies.*

17.50.050 – Pre-application conference.
A. Pre-application Conference. Prior to a Type II – IV or Legislative application, excluding Historic Review, being deemed complete, the applicant shall schedule and attend a pre-application conference with City staff to discuss the proposal, unless waived by the Community Development Director. The purpose of the pre-application conference is to provide an opportunity for staff to provide the applicant with information on the likely impacts, limitations, requirements, approval standards, fees and other information that may affect the proposal.
1. To schedule a pre-application conference, the applicant shall contact the Planning Division, submit the required materials, and pay the appropriate conference fee.
2. At a minimum, an applicant should submit a short narrative describing the proposal and a proposed site plan, drawn to a scale acceptable to the City, which identifies the proposed land uses, traffic circulation, and public rights-of-way and all other required plans.
3. The Planning Division shall provide the applicant(s) with the identity and contact persons for all affected neighborhood associations as well as a written summary of the pre-application conference.
B. A pre-application conference shall be valid for a period of six months from the date it is held. If no application is filed within six months of the conference or meeting, the applicant shall schedule and attend another conference before the City will accept a permit application. The Community Development Director may waive the pre-application requirement if, in the Director's opinion, the development has not changed significantly and the applicable municipal code or standards have not been significantly amended. In no case shall a pre-application conference be valid for more than one year.
C. Notwithstanding any representations by City staff at a pre-application conference, staff is not authorized to waive any requirements of this code, and any omission or failure by staff to recite to an applicant all relevant applicable land use requirements shall not constitute a waiver by the City of any standard or requirement.

Finding: Complies. The application was submitted within six months of the pre-application conference held on 11/19/25. Therefore, the pre-application conference remains valid, and no additional conference is required.

17.50.055 - Neighborhood association meeting.

Neighborhood Association Meeting. The purpose of the meeting with the recognized neighborhood association is to inform the affected neighborhood association about the proposed development and to receive the preliminary responses and suggestions from the neighborhood association and the member residents.
A. Applicants applying for annexations, zone change, comprehensive plan amendments, conditional use, Planning Commission variances, subdivision, or site plan and design review (excluding minor site plan and design review), general development master plans or detailed development plans applications shall schedule and attend a meeting with the City-recognized neighborhood association in whose territory the application is proposed no earlier than one year prior to the date of application. Although not required for other projects than those identified above, a meeting with the neighborhood association is highly recommended.
B. The applicant shall request via email or regular mail a request to meet with the neighborhood association chair where the proposed development is located. The notice shall describe the proposed project. A copy of this notice shall also be provided to the chair of the citizen involvement committee.
C. A meeting shall be scheduled within thirty days of the date that the notice is sent. A meeting may be scheduled later than thirty days if by mutual agreement of the applicant and the neighborhood association. If the neighborhood association does not want to, or cannot meet within thirty days, the applicant shall host a meeting inviting the neighborhood association, citizen involvement committee, and all property owners within three hundred feet to attend. This meeting shall not begin before six p.m. on a weekday or may be held on a weekend and shall occur within the neighborhood association boundaries or at a city facility.
D. If the neighborhood association is not currently recognized by the City, is inactive, or does not exist, the applicant shall request a meeting with the citizen involvement committee.
E. To show compliance with this section, the applicant shall submit a copy of the email or mail notice to the neighborhood association and CIC chair, a sign-in sheet of meeting attendees, and a summary of issues discussed at the meeting. If the applicant held a separately noticed meeting, the applicant shall submit a copy of the meeting flyer, postcard or other correspondence used, and a summary of issues discussed at the meeting and submittal of these materials shall be required for a complete application.

Finding: Complies. The Applicant met with the Two Rivers Neighborhood Association to present the development proposal on October 22, 2025. Prior meetings with the Two Rivers Neighborhood Association were also held on February 18, 2025, and April 23, 2025. In addition, the applicant also met with the Citizen Involvement Committee on November 3, 2025, to present the development proposal.

17.50.060 Application requirements.
A permit application may only be initiated by the record property owner or contract purchaser, the City Commission or Planning Commission. If there is more than one record owner, then the City will not complete a Type II—IV application without signed authorization from all record owners. All permit applications shall be submitted on the form provided by the City, along with the appropriate fee and all necessary supporting documentation and information, sufficient to demonstrate compliance with all applicable approval criteria. The applicant has the burden of demonstrating, with evidence, that all applicable approval criteria are, or can be, met.

Finding: Complies. The applicant has indicated that Level OCC-01 LLC is the applicant for this application and is authorized to submit the application on behalf of the property owner, Clackamas County. This application has been submitted in accordance with OCMC 17.50.060, with authorization from the record property owner, and includes all required forms, fees, and supporting documentation necessary to demonstrate compliance with applicable approval criteria.

17.50.070 Completeness review and one hundred twenty-day rule.
A. Upon submission, the Community Development Director shall date stamp the application form and verify that all of the appropriate application review fee(s) have been submitted. Upon receipt of all review fees and an application form, the Community Development Director will then review the application and all information submitted with it and evaluate whether the application is complete enough to process. Within thirty days of receipt of the application and all applicable review fees, the Community Development Director shall complete this initial review and issue to the applicant a written statement indicating whether the application is complete enough to process, and if not, what information shall be submitted to make the application complete.
B. The applicant has one hundred eighty days from the date the application was made to submit the missing information or the application shall be rejected and the unused portion of the application fee returned to the applicant. If the applicant submits the requested information within the one hundred eighty-day period, the Community Development Director shall again verify whether the application, as augmented, is complete. Each such review and verification shall follow the procedure in subsection A of this section.
The application will be deemed complete for the purpose of this section upon receipt by the Community Development Director of:
1. All the missing information;
2. Some of the missing information and written notice from the applicant that no other information will be provided; or
3. Written notice from the applicant that none of the missing information will be provided.
C. Once the Community Development Director determines the application is complete enough to process, or the applicant refuses to submit any more information, the City shall declare the application complete. Pursuant to ORS 227.178, the City will reach a final decision on an application within one hundred twenty calendar days from the date that the application is determined to be or deemed complete unless the applicant agrees to suspend the one hundred twenty-calendar-day timeline or unless state law provides otherwise. The one hundred twenty-day period, however, does not apply in the following situations:
1. Any hearing continuance or other process delay requested by the applicant shall be deemed an extension or waiver, as appropriate, of the one hundred twenty-day period.
2. Any delay in the decision-making process necessitated because the applicant provided an incomplete set of mailing labels for the record property owners within three hundred feet of the subject property shall extend the one hundred twenty-day period for the amount of time required to correct the notice defect.
3. The one hundred twenty-day period does not apply to any application for a permit that is not wholly within the City's authority and control.

4. The one hundred twenty-day period does not apply to any application for an amendment to the City's comprehensive plan or land use regulations nor to any application for a permit, the approval of which depends upon a plan amendment.

D. A one hundred day-period applies in place of the one hundred twenty-day period for affordable housing projects where:
1. The project includes five or more residential units, including assisted living facilities or group homes;
2. At least fifty percent of the residential units will be sold or rented to households with incomes equal to or less than sixty percent of the median family income for Clackamas County or for the state, whichever is greater; and
3. Development is subject to a covenant restricting the owner and successive owner from selling or renting any of the affordable units as housing that is not affordable for a period of sixty years from the date of the certificate of occupancy.
E. The one hundred twenty-day period specified in OCMC 17.50.070.C or D may be extended for a specified period of time at the written request of the applicant. The total of all extensions may not exceed two hundred forty-five calendar days.
F. The approval standards that control the City's review and decision on a complete application are those which were in effect on the date the application was first submitted.

Finding: Complies. The following dates indicate compliance with the above standards. Application Submitted**:** 01/05/2026 Application Complete: 01/23/2026 120-Day Decision Deadline: 05/23/2026

17.50.080 Complete application—Required information.
Unless stated elsewhere in OCMC 16 or 17, a complete application includes all the materials listed in this
subsection. The Community Development Director may waive the submission of any of these materials if not deemed to be applicable to the specific review sought. Likewise, within thirty days of when the application is first submitted, the Community Development Director may require additional information, beyond that listed in this subsection or elsewhere in Titles 12, 14, 15, 16, or 17, such as a traffic study or other report prepared by an appropriate expert. In any event, the applicant is responsible for the completeness and accuracy of the application and all of the supporting documentation, and the City will not deem the application complete until all information required by the Community Development Director is submitted. At a minimum, the applicant shall submit the following:
A. One copy of a completed application form that includes the following information:
1. An accurate address and tax map and location of all properties that are the subject of the application;
2. Name, address, telephone number and authorization signature of all record property owners or contract owners, and the name, address and telephone number of the applicant, if different from the property owner(s);
B. A complete list of the permit approvals sought by the applicant;
C. A complete and detailed narrative description of the proposed development;
D. A discussion of the approval criteria for all permits required for approval of the development proposal that explains how the criteria are or can be met or are not applicable, and any other information indicated by staff at the pre-application conference as being required;
E. One copy of all architectural drawings and site plans shall be submitted for Type II—IV applications.
One paper copy of all application materials shall be submitted for Type I applications;
F. For all Type II—IV applications, the following is required:
1. An electronic copy of all materials.

2. Mailing labels or associated fee for notice to all parties entitled under OCMC 17.50.090 to receive mailed notice of the application. The applicant shall use the names and addresses of property owners within the notice area indicated on the most recent property tax rolls.
3. Documentation indicating there are no liens favoring the City on the subject site.
4. A receipt from the county assessor's office indicating that all taxes for the lot or parcels involved are paid in full for the preceding tax year.
5. A current preliminary title report or trio for the subject property(ies);
G. All required application fees;
H. Annexation agreements, traffic or technical studies (if applicable);
I. Additional documentation, as needed and identified by the Community Development Director.

Finding: Complies. The application was reviewed for the above applicable information and deemed complete on 1/23/2026.

17.50.090 - Public notices.
All public notices issued by the City announcing applications or public hearings of quasi-judicial or legislative actions, shall comply with the requirements of this section.
B. Notice of Public Hearing on a Type III or IV Quasi-Judicial Application. Notice for all public hearings concerning a quasi-judicial application shall conform to the requirements of this subsection. At least twenty days prior to the hearing, the City shall prepare and send, by first class mail, notice of the hearing to all record owners of property within three hundred feet of the subject property and to any city-recognized neighborhood association whose territory includes the subject property. The City shall also publish the notice on the City website within the City at least twenty days prior to the hearing. Pursuant to OCMC 17.50.080.H, the applicant is responsible for providing an accurate and complete set of mailing labels for these property owners and for posting the subject property with the City-prepared notice in accordance with OCMC 17.50.100. Notice of the application hearing shall include the following information:
1. The time, date and location of the public hearing;
2. Street address or other easily understood location of the subject property and city-assigned planning file number;
3. A description of the applicant's proposal, along with a list of citations of the approval criteria that the City will use to evaluate the proposal;
4. A statement that any interested party may testify at the hearing or submit written comments on the proposal at or prior to the hearing and that a staff report will be prepared and made available to the public at least seven days prior to the hearing;
5. A statement that any issue which is intended to provide a basis for an appeal to the City Commission shall be raised before the close of the public record. Issues must be raised and accompanied by statements or evidence sufficient to afford the City and all parties to respond to the issue;
6. The notice shall state that a city-recognized neighborhood association requesting an appeal fee waiver pursuant to OCMC 17.50.290.C must officially approve the request through a vote of its general membership or board at a duly announced meeting prior to the filing of an appeal;
7. A statement that the application and all supporting materials and evidence submitted in support of the application may be inspected at no charge and that copies may be obtained at reasonable cost at the planning division offices during normal business hours; and
8. The name and telephone number of the planning staff person responsible for the application or is otherwise available to answer questions about the application.

Finding: Complies. Public notices satisfying these requirements were initially mailed to property owners and occupants within 300 feet of the subject site on February 17, 2026, and the public comment deadline for inclusion in the staff report was February 27, 2026.

17.50.100 - Notice posting requirements.
Where this chapter requires notice of a pending or proposed permit application or hearing to be posted on the subject property, the requirements of this section shall apply.
A. City Guidance and the Applicant's Responsibility. The City shall supply all of the notices which the applicant is required to post on the subject property and shall specify the dates the notices are to be posted and the earliest date on which they may be removed. The City shall also provide a statement to be signed and returned by the applicant certifying that the notice(s) were posted at the correct time and that if there is any delay in the City's land use process caused by the applicant's failure to correctly post the subject property for the required period of time and in the correct location, the applicant agrees to extend the applicable decision-making time limit in a timely manner.
B. Number and Location. The applicant shall place the notices on each frontage of the subject property. If the property's frontage exceeds six hundred feet, the applicant shall post one copy of the notice for each six hundred feet or fraction thereof. Notices do not have to be posted adjacent to alleys or unconstructed right-of-way. Notices shall be posted within ten feet of the street and shall be visible to pedestrians and motorists. Notices shall not be posted within the public right-of-way or on trees. The applicant shall remove all signs within ten days following the event announced in the notice.
Finding: Complies. The applicant posted the property with 4 signatures (one on each frontage) and provided an affidavit stating they were installed in accordance with the requirements of this section.

17.50.110 Assignment of decision-makers.
The following City entity or official shall decide the following types of applications:
A. Type I Decisions. The Community Development Director shall render all Type I decisions. The Community Development Director's decision is the City's final decision on a Type I application.
B. Type II Decisions. The Community Development Director shall render the City's decision on all Type II permit applications, which are then appealable to the City Commission with notice to the Planning Commission. The City's final decision is subject to review by LUBA.
C. Type III Decisions. The Planning Commission or Historic Review Board, as applicable, shall render all Type III decisions. Such decision is appealable to the City Commission, on the record. The City Commission 's decision is the city's final decision and is subject to review by LUBA within twenty-one days of when it becomes final.
D. Type IV Decisions. The Planning Commission shall render the initial decision on all Type IV permit applications. If the Planning Commission denies the Type IV application, that decision is final unless appealed in accordance with OCMC 17.50.190. If the Planning Commission recommends approval of the application, that recommendation is forwarded to the City Commission. The City Commission decision is the City's final decision on a Type IV application and is subject to review LUBA.
E. Expedited Land Division (ELD). The Community Development Director shall render the initial decision on all ELD applications. The Community Development Director's decision is the City's final decision unless appealed in accordance to ORS 197.375 to a City-appointed hearings referee. The

hearings referee decision is the City's final decision which is appealable to the Oregon Court of Appeals.

Finding: Complies. A Willamette River Greenway Compatible Review is a Type III Planning Commission Decision.

17.50.120 Quasi-judicial hearing process.
All public hearings pertaining to quasi-judicial permits, whether before the Planning Commission, Historic Review Board, or City Commission, shall comply with the procedures of this section. In addition, all public hearings held pursuant to this chapter shall comply with the Oregon Public Meetings Law, the applicable provisions of ORS 197.763 and any other applicable law.
A. Once the Community Development Director determines that an application for a Type III or IV decision is complete, the planning division shall schedule a hearing before the Planning Commission or Historic Review Board, as applicable. Once the Community Development Director determines that an appeal of a Type II, Type III or Type IV decision has been properly filed under OCMC 17.50.190, the planning division shall schedule a hearing pursuant to OCMC 17.50.190.
B. Notice of the Type III or IV hearing shall be issued at least twenty days prior to the hearing in accordance with OCMC 17.50.090.B.
C. Written notice of an appeal hearing shall be sent by regular mail no later than fourteen days prior to the date of the hearing to the appellant, the applicant if different from the appellant, the property owner(s) of the subject site, all persons who testified either orally or in writing before the hearing body and all persons that requested in writing to be notified.
D. The Community Development Director shall prepare a staff report on the application which lists the applicable approval criteria, describes the application and the applicant's development proposal, summarizes all relevant city department, agency and public comments, describes all other pertinent facts as they relate to the application and the approval criteria and makes a recommendation as to whether each of the approval criteria are met.
E. At the beginning of the initial public hearing at which any quasi-judicial application or appeal is reviewed, a statement describing the following shall be announced to those in attendance:
1. That the hearing will proceed in the following general order: Staff report, applicant's presentation, testimony in favor of the application, testimony in opposition to the application, rebuttal, record closes, commission deliberation and decision;
2. That all testimony and evidence submitted, orally or in writing, shall be directed toward the applicable approval criteria. If any person believes that other criteria apply in addition to those addressed in the staff report, those criteria shall be listed and discussed on the record. The meeting chairperson may reasonably limit oral presentations in length or content depending upon time constraints. Any party may submit written materials of any length while the public record is open;
3. Failure to raise an issue on the record with sufficient specificity and accompanied by statements or evidence sufficient to afford the City and all parties to respond to the issue, will preclude appeal on that issue to the land use board of appeals;
4. Any party wishing a continuance or to keep open the record shall make that request while the record is still open;
5. That the commission chair shall call for any ex-parte contacts, conflicts of interest or bias before the beginning of each hearing item; and
6. For appeal hearings, only those persons who participated either orally or in writing in the decision or review will be allowed to participate either orally or in writing on the appeal.

F. Requests for continuance and to keep open the record: The hearing may be continued to allow the submission of additional information or for deliberation without additional information. New notice of a continued hearing need not be given so long as a time-certain and location is established for the continued hearing. Similarly, hearing may be closed but the record kept open for the submission of additional written material or other documents and exhibits. The chairperson may limit the factual and legal issues that may be addressed in any continued hearing or open record period.

Finding: Complies. This application will follow the Type III quasi-judicial hearing process.

17.50.130 Conditions of approval and notice of decision.
A. All City decision-makers have the authority to impose reasonable conditions of approval designed to ensure that all applicable approval standards, including standards set out in city overlay districts, the City's master plans, and City public works design standards, are, or can be met.
B. Failure to comply with any condition of approval shall be grounds for revocation of the permit(s) and grounds for instituting code enforcement proceedings pursuant to OCMC 1.20 of this code and ORS 30.315.
C. Notice of Decision. The City shall send, by first class mail, a notice of all decisions rendered under this chapter to all persons with standing, i.e., the applicant, all others who participated either orally or in writing before the close of the public record and those who specifically requested notice of the decision. The notice of decision shall include the following information:
1. The file number and date of decision;
2. The name of the applicant, owner and appellant (if different);
3. The street address or other easily understood location of the subject property;
4. A brief summary of the decision, and if an approval, a description of the permit approved;
5. A statement that the decision is final unless appealed and description of the requirements for perfecting an appeal;
6. The contact person, address and a telephone number whereby a copy of the final decision may be inspected or copies obtained.
D. Modification of Conditions. Any request to modify a condition of permit approval is to be considered either minor modification or a major modification, unless otherwise authorized. A minor modification shall be processed as a Type I. A major modification shall be processed in the same manner and shall be subject to the same standards as was the original application. However, the decision-maker may at their sole discretion, consider a modification request and limit its review of the approval criteria to those issues or aspects of the application that are proposed to be changed from what was originally approved.

Finding: Complies. A Notice of Decision with attached Conditions of Approval will be sent to all parties with standing, including the required information.

17.50.140 – Financial guarantees.
When conditions of permit approval require a permitee to construct certain public improvements, the City shall require the permitee to provide financial guarantee for construction of the certain public improvements. Financial guarantees shall be governed by this section.
A. Form of Guarantee. Guarantees shall be in a form approved by the City attorney. Approvable forms of guarantee include irrevocable standby letters of credit to the benefit of the City issued by a

recognized lending institution, certified checks, dedicated bank accounts or allocations of construction loans held in reserve by the lending institution for the benefit of the City. The form of guarantee shall be specified by the City engineer and, prior to execution and acceptance by the City shall be reviewed and approved by the City attorney. The guarantee shall be filed with the City engineer.

B. Performance Guarantees. A permittee shall be required to provide a performance guarantee as follows.

1. After Final Approved Design by the City. The City may request the permittee to submit a performance guarantee for construction of certain public improvements. A permitee may request the option of submitting a performance guarantee when prepared for temporary/final occupancy. The guarantee shall be one hundred twenty percent of the estimated cost of constructing the public improvements as submitted by the permittee's engineer. The engineer's estimated costs shall be supported by a verified engineering estimate and approved by the City engineer.

2. Before Complete Design Approval and Established Engineered Cost Estimate. The City may request a permittee to submit a performance guarantee for construction of certain public improvements. A permitee may request the option of submitting a performance guarantee before public improvements are designed and completed. The guarantee shall be one hundred fifty percent of the estimated cost of constructing the public improvements as submitted by the permittee's engineer and approved by the City engineer. The engineer's estimated costs shall be supported by a verified engineering estimate and approved by the City engineer.

C. Release of Guarantee. The guarantee shall remain in effect until the improvement is actually constructed and accepted by the City. Once the City has inspected and accepted the improvement, the City shall release the guarantee to the permittee. If the improvement is not completed to the City's satisfaction within the time limits specified in the permit approval, the City engineer may, at their discretion, draw upon the guarantee and use the proceeds to construct or complete construction of the improvement and for any related administrative and legal costs incurred by the City in completing the construction, including any costs incurred in attempting to have the permittee complete the improvement. Once constructed and approved by the City, any remaining funds shall be refunded to the permittee. The City shall not allow a permittee to defer construction of improvements by using a performance guarantee, unless the permittee agrees to construct those improvements upon written notification by the City, or at some other mutually agreed-to time. If the permittee fails to commence construction of the required improvements within six months of being instructed to do so, the City may, without further notice, undertake the construction of the improvements and draw upon the permittee's performance guarantee to pay those costs.

D. Fee-in-lieu. When conditions of approval or the City engineer allows a permittee to provide a fee-in-lieu of actual construction of public improvements, the fee shall be one hundred fifty percent of the estimated cost of constructing the public improvements as submitted by the permittee's engineer and approved by the City engineer. The percentage required is to ensure adequate funds for the future work involved in design, bid, contracting, and construction management and contract closeout. The engineer's estimated costs shall be supported by a verified engineering estimate and approved by the City engineer. The fee-in-lieu shall be submitted as cash, certified check, or other negotiable instrument acceptable by the City attorney.

Finding: Not applicable. A Performance Guarantee which is equal to 120% of the estimated cost for construction of public improvements as shown in City approved construction plans will be reviewed and conditioned as part of the Type II Site Plan and Design Review.

17.50.141 – Public improvements – Warranty

All public improvements not constructed by the City, shall be maintained and under warranty provided by the property owner or developer constructing the facilities until the City accepts the improvements at the end of the warranty period. The warranty is to be used at the discretion of the City engineer or designee to correct deficiencies in materials or maintenance of constructed public infrastructure, or to address any failure of engineering design.

A. Duration of Warranty. Responsibility for maintenance of public improvements shall remain with the property owner or developer for a warranty period of two years.

B. Financial Guarantee. Approvable forms of guarantee include irrevocable standby letters of credit to the benefit of the City issued by a recognized lending institution, bond, certified checks, dedicated bank accounts or allocations of construction loans held in reserve by the lending institution for the benefit of the City. The form of guarantee shall be specified by the City engineer and, prior to execution and acceptance by the City shall be reviewed and approved by the City attorney. The guarantee shall be filed with the City engineer.

C. Amount of Warranty. The amount of the warranty shall be equal to fifteen percent of the estimated cost of construction of all public improvements (including those improvements that will become owned and maintained by the City at the end of the two-year maintenance period), and shall be supported by a verified engineering estimate and approved by the City engineer. Upon expiration of the warranty period and acceptance by the City as described below, the City shall be responsible for maintenance of those improvements.

D. Transfer of Maintenance. The City will perform an inspection of all public improvements approximately forty-five days before the two-year warranty period expires. The public improvements shall be found to be in a clean, functional condition by the City engineer before acceptance of maintenance responsibility by the City. Transfer of maintenance of public improvements shall occur when the City accepts the improvements at the end of the two-year warranty period.

Finding: Not applicable. Public improvements will be reviewed and conditioned as part of the Type II Site Plan and Design Review.

RECOMMENDATION:

Based on the analysis and findings as described above, staff concludes that the Willamette River Greenway Review located at 807 Main Street, Oregon City, Oregon 97045, identified as Clackamas County Map 3-2E-06DB Tax lot 04400, can meet the requirements as described in the Oregon City Municipal Code by complying with the Conditions of Approval provided in this report. Therefore, the Community Development Director recommends approval with conditions, based upon the findings and exhibits contained in this staff report.

TYPE III Design Review - Willamette River Greenway Overlay
Applicant's Submittal
January 5, 2026

APPLICANT:	Seth Henderson, Managing Member | Level OCC-01 LLC 7327 SW Barnes #523, Portland, OR 97225
OWNER:	Clackamas County 2051 Kaen Rd, Ste 450 Oregon, City, OR 97045
REQUEST:	Review and approval of the Willamette River Greenway overlay criteria. The development is a mixed-use space with ground-floor retail, 84 apartments, including a mix of studio, one-bedroom, and two-bedroom units. It also features amenities, support spaces, and off-street parking. The total proposed area is 83,000 square feet. The ground-floor retail space is 2,600 square feet and is directly adjacent to Liberty Plaza. The building is planned as a five-story wood-framed structure above a one-level, partially subterranean concrete parking garage.
LOCATION:	807 Main Street, Oregon City, OR 97045 Clackamas County Map 22E31AB0 TL4400

I. BACKGROUND:

1. Existing Conditions

Willamette River Greenway

17.48.100 - Compatibility review.
A. In all areas within one hundred fifty feet of the Oregon Department of State Lands' mapped ordinary low-water line of the Willamette River, hereinafter referred to as the "compatibility boundary," the provisions of this subsection shall be applicable to all developments and changes or intensification of uses, so as to ensure their compatibility with Oregon's Greenway statutes, and to assure that the best possible appearance, landscaping and public access be provided.
B. All development or changes or intensifications of uses in the compatibility area shall be approved only if the following findings are made by the planning commission through a Type III review process pursuant to OCMC 17.50.
1. That to the greatest extent possible, the development, change, or intensification of use provides for the maximum possible landscaped area, open space, or vegetation between the activity and the river.
2. That to the greatest degree possible, necessary public access is provided to and along the Willamette River by appropriate legal means.

2. Project Description

Municipal Code Standards and Requirements: The following sections of the Oregon City Municipal Code are applicable to this land use approval:
Chapter 17.34 MUD Mixed Use Downtown District
Chapter 17.50 Administration And Procedures
Chapter 17.48 -WRG Willamette River Greenway Overlay District

REQUIRED CODE RESPONSES:
CHAPTER 17.34 MUD MIXED USE DOWNTOWN DISTRICT

17.34.010 Designated.
The mixed-use downtown (MUD) district is designed to apply within the traditional downtown core along Main Street and includes the "north-end" area, generally between 5th Street and Abernethy Street, and some of the area bordering McLoughlin Boulevard. Land uses are characterized by high-volume establishments constructed at the human scale such as retail, service, office, multi-family residential, lodging or similar as defined by the Community Development Director. A mix of high-density residential, office and retail uses are encouraged in this district, with retail and service uses on the ground floor and office and residential uses on the upper floors. The emphasis is on those uses that encourage pedestrian and transit use. This district includes a downtown design district overlay for the historic downtown area. Retail and service uses on the ground floor and office and residential uses on the upper floors are encouraged in this district. The design standards for this sub-district require a continuous storefront façade featuring streetscape amenities to enhance the active and attractive pedestrian environment.

17.34.020 - Permitted uses.
Permitted uses in the MUD district are defined as:
A. Banquet, conference facilities and meeting rooms;
B. Bed and breakfast/boarding houses, hotels, motels, and other lodging facilities;
C. Child care centers and/or nursery schools;
D. Indoor entertainment centers and arcades;
E. Health and fitness clubs;
F. Medical and dental clinics, outpatient; infirmary services;
G. Museums, libraries and cultural facilities;
H. Offices, including finance, insurance, real estate and government;
I. Outdoor markets, such as produce stands, craft markets and farmers markets that are operated on the weekends and after six p.m. during the weekday;
J. Postal services;
K. Repair shops, for radio and television, office equipment, bicycles, electronic equipment, shoes and small appliances and equipment;
L. Multifamily residential, triplexes and quadplexes;
M. 1 or 2 units in conjunction with a nonresidential use provided that the residential use occupies no more than 50% of the total square footage of the development;
N. Restaurants, eating and drinking establishments without a drive through;
O. Services, including personal, professional, educational and financial services; laundry and dry-cleaning;
P. Retail trade, including grocery, hardware and gift shops, bakeries, delicatessens, florists, pharmacies, specialty stores provided the maximum footprint of a freestanding building with a single store does not

exceed sixty thousand square feet (a freestanding building over sixty thousand square feet is allowed as long as the building contains multiple stores);
Q. Seasonal sales;
R. Residential care facilities, assisted living facilities; nursing homes and group homes for over fifteen patients licensed by the state;
S. Studios and galleries, including dance, art, photography, music and other arts;
T. Utilities: Basic and linear facilities, such as water, sewer, power, telephone, cable, electrical and natural gas lines, not including major facilities such as sewage and water treatment plants, pump stations, water tanks, telephone exchanges and cell towers;
U. Veterinary clinics or pet hospitals, pet day care;
V. Home occupations;
W. Research and development activities;
X. Temporary real estate offices in model dwellings located on and limited to sales of real estate on a single piece of platted property upon which new residential buildings are being constructed;
Y. Transportation facilities;
Z. Live/work dwellings;
AA. After-hours public parking;
BB. Marinas;
CC. Religious institutions.
DD. Mobile food units outside of the downtown design district.

Applicant's Response: The proposed development includes multi-family and retail trade, as described above as a permitted use, therefore this standard is met.

17.34.030 - Conditional uses.
The following uses are permitted in this district when authorized and in accordance with the process and standards contained in OCMC 17.56.
A. Drive-through facilities;
B. Emergency services;
C. Hospitals;
D. Outdoor markets that do not meet the criteria of OCMC 17.34.020.I.;
E. Parks, playgrounds, play fields and community or neighborhood centers;
F. Parking structures and lots not in conjunction with a primary use on private property, excluding after-hours public parking;
G. Retail trade, including grocery, hardware and gift shops, bakeries, delicatessens, florists, pharmacies and specialty stores in a freestanding building with a single store exceeding a foot print of sixty thousand square feet;
H. Public facilities such as sewage and water treatment plants, water towers and recycling and resource recovery centers;
I. Public utilities and services such as pump stations and sub-stations;
J. Distributing, wholesaling and warehousing;
K. Gas stations;
L. Public and or private educational or training facilities;
M. Stadiums and arenas;
N. Passenger terminals (water, auto, bus, train), excluding bus stops;
O. Recycling center and/or solid waste facility;
P. Shelters, except within the Downtown Design District.

Applicant's Response: No conditional uses are proposed, therefore these standards are not applicable to the development.

17.34.040 - Prohibited uses.
The following uses are prohibited in the MUD district:
A. Kennels;
B. Outdoor storage and sales, not including outdoor markets allowed in OCMC 17.34.030;
C. Self-service storage;
D. Single-Family detached residential units, townhouses and duplexes;
E. Motor vehicle and recreational vehicle repair/service;
F. Motor vehicle and recreational vehicle sales and incidental service;
G. Heavy equipment service, repair, sales, storage or rental2 (including but not limited to construction equipment and machinery and farming equipment);
H. Marijuana production, processing, wholesaling, research, testing, and laboratories;
I. Mobile food units within the downtown design district unless a special event has been issued.

Applicant's Response: No prohibited uses are proposed, therefore these standards are not applicable to the development.

17.34.070 - Mixed-use downtown dimensional standards—For properties located within the downtown design district.
A. Minimum lot area: None.

Applicant's Response: No minimum lot area is required, therefore the project meets this standard as proposed.

B. Minimum floor area ratio: 0.5.

Applicant's Response: Proposed FAR is 1.64:1, therefore, the minimum standard is met.

C. Minimum building height: Twenty-five feet or two stories except for accessory structures or buildings under one thousand square feet.

Applicant's Response: The building is planned as a five-story wood-framed structure above a one-level, partially subterranean concrete parking garage. Therefore, the project meets this standard as proposed.

D. Maximum building height: Fifty-eight feet.

Applicant's Response: Building will not exceed 58' and is currently designed at 57' from the average grade along Main Street, therefore the project meets this standard as proposed.

E. Minimum required setbacks, if not abutting a residential zone: None.

Applicant's Response: No minimum setbacks are required, therefore the project meets this standard as proposed.

F. Minimum required interior and rear yard setback if abutting a residential zone: Twenty feet, plus one foot additional yard setback for every three feet in building height over thirty-five feet.

Applicant's Response: Project does not abut a residential zone, therefore this standard is not applicable to this development.

G. Maximum Allowed Setbacks.
1. Front yard setback: Ten feet.

Applicant's Response: The project proposes a zero-foot front yard setback, which meets the maximum allowed setback standard.

2. Interior side yard setback: No maximum.

Applicant's Response: Due to Liberty Plaza and the existing parking lot, the interior side yard setback is set back extensively from 9th Street. Provided there is no maximum setback at interior side yards, the project meets this standard as proposed.

3. Corner side yard setback abutting street: Ten feet.

Applicant's Response: Current setback along 8th Street is 8', therefore, this standard is met.

4. Rear yard setback: No maximum.

Applicant's Response: The project rear yard abuts a street, therefore, this standard is not applicable.

5. Rear yard setback abutting street: Ten feet. Public utility easements may supersede the minimum setback. Maximum setback may be increased per OCMC 17.62.055.D

Applicant's Response: The proposed rear setback is 28'-3", which is an increase from the existing courthouse. This setback exceeds the minimum, therefore, the project meets this standard as proposed.

H. Maximum site coverage of the building and parking lot: Ninety-five percent.

Applicant's Response: Current proposed site coverage is 79.5%, therefore, this standard is met.

I. Minimum landscape requirement (including parking lot): 5 percent.

Applicant's Response: Current proposed landscape coverage is 20.5%, therefore, this standard is met.

J. Residential minimum net density of 17.4 units per acre, except that no minimum net density shall apply to residential uses proposed above nonresidential uses in a vertical mixed-use configuration or to live/work dwellings.

Applicant's Response: No minimum density is required as residential uses are proposed over non-residential uses in a vertical mixed-use configuration, therefore the standard is not applicable.

K. Standalone residential development of fewer than five units are exempt from maximum setbacks of the underlying zone.

Applicant's Response: Project proposed as containing 84 units, therefore this standard is not applicable.

CHAPTER 17.48 WRG WILLAMETTE RIVER GREENWAY OVERLAY DISTRICT

17.48.010 - Designated.
This chapter shall apply to all development, changes of use or intensification of use in that area designated WRG Willamette River Greenway on a special city zoning map.

17.48.020 - Purpose.
The purpose of this chapter is to:
A. Protect, conserve, enhance and maintain the natural scenic, historical, agricultural, economic and recreational qualities of land along the Willamette River;
B. Maintain the integrity of the Willamette River by minimizing erosion, promoting bank stability and maintaining and enhancing water quality and fish and wildlife habitats;
C. Implement the Willamette River Greenway goal and the Willamette River Greenway portions of the City comprehensive plan.

17.48.040 - Uses allowed.
All uses permitted pursuant to the provisions of the underlying zoning district are permitted on lands designated WRG; provided, however, that any development, change of use or intensification of use shall be subject, in addition to the provisions of the underlying district, to the provisions of this chapter.

Applicant's Response: Proposed project meets provisions of underlying zoning district and allowed uses, therefore this standard is met.

17.48.050 - Permit required—Exceptions.
A Willamette River Greenway permit shall be required for all developments and changes or intensification of uses, except the following:
A. The propagation of timber or the cutting of timber for public safety or personal use, except the cutting of timber along the natural vegetative fringe along the river;
B. Gravel removal from the bed of the Willamette River when conducted under a permit from the state;
C. Customary dredging and channel maintenance;
D. Placing by a public agency of signs, markers, aids and similar structures to serve the public;
E. Activities to protect, conserve, enhance and maintain public recreation, scenic, historical and natural uses on public lands;
F. Acquisition and maintenance of scenic easements by the Oregon Department of Transportation;
G. Partial harvesting of timber shall be permitted beyond the natural vegetative fringe and those areas not covered by a scenic easement and when the harvest is consistent with an approved plan under the Oregon Forest Practices Act. Commercial forest activities and harvesting practices providing for vegetative buffers, shading, soil stabilization, and water filtering effects required under the Oregon Forest Practices Act;
H. The use of a small cluster of logs for erosion control;

I. The expansion of capacity or the replacement of existing communication or energy distribution and transmission systems, except utility sub-stations;
J. The maintenance and repair of existing flood control facilities;
K. Any activity subject to Type I review pursuant to OCMC 17.62.035.A.2, provided that proposed changes are located entirely outside of the compatibility boundary and on existing developed commercial, multifamily, or industrial properties.
L. Within the compatibility boundary, exterior building changes that are not considered remodeling.
M. Changes to landscaping or parking subject to Type I review pursuant to OCMC 17.62.035.A.2 that are more than 100 feet from the Oregon Department of State Lands' mapped ordinary low water line of the Willamette River, provided that changes are located on existing developed commercial, multifamily, or industrial properties.
N. On existing single or two-family residential properties, landscaping, construction of driveways, modification of existing structures or construction or placement of such subsidiary structures or facilities adjacent to the residence.
O. The addition of a wall sign, projecting sign, or roof sign on any building in the WRG overlay.

Applicant's Response: Proposed project does not meet any of the listed exceptions, therefore, a permit will be required.

17.48.060 - Procedures.
Except as specifically provided for in Section 17.48.100, the procedure for action on a Willamette River Greenway permit shall be as provided for under the Type II review provisions in OCMC 17.50.

17.48.070 - Development standards—Specific use.
In approving any development or change or intensification of use, the approving officer or body shall apply the following standards:

Considerations for Specific Uses.
A. With respect to recreational uses only: the considerations set forth in section C.3.b of Goal 15.
B. With respect to those fish and wildlife habitats identified in the City comprehensive plan only: the considerations set forth in section C.3.d. of Goal 15.
C. With respect to those scenic qualities and views identified in the City comprehensive plan only: the considerations set forth in section C.3.e. of Goal 15.
D. With respect to timber resources only: the considerations set forth in section C.3.h. of Goal 15.
E. With respect to aggregate extraction only: the considerations set forth in section C.3.i. of Goal 15.

Applicant's Response: The proposed development is a residential use and is not a recreational use, does not involve timber resources, and does not include aggregate extraction. Therefore, the considerations set forth in Goal 15 Sections C.3.b, C.3.h, and C.3.i are not applicable.

The site is not identified in the Oregon City Comprehensive Plan as a designated fish and wildlife habitat, and no such habitat is affected by the proposal; therefore, the considerations in Section C.3.d of Goal 15 are not applicable.

With respect to scenic qualities and views identified in the Comprehensive Plan, the project has been designed to be compatible with the Willamette River corridor through building placement, preservation of existing vegetation, and supplemental native landscaping, consistent with the intent of Goal 15 Section C.3.e.

17.48.080 - Development standards—General considerations.
The following considerations shall be applicable to all Willamette River Greenway permits.
A. Access. Adequate public access to the Willamette River shall be considered and provided for.

Applicant's Response: Public access to the Willamette River is addressed through site planning that preserves adequate space for future implementation of the McLoughlin Boulevard Enhancement Plan (Phase 3), as adopted in the Transportation System Plan. While construction of these improvements is not included in this approval, the project acknowledges the required area and will provide a public access easement over portions of the site necessary to accommodate future public access improvements.

B. Protection and Safety. Maintenance of public safety and protection of public and private property, especially from vandalism and trespass, shall be provided for to the maximum extent practicable.

Applicant's Response: Public safety and property protection are provided through site layout, building design, lighting, and access control measures that minimize opportunities for vandalism and trespass, consistent with clear and objective development standards.

C. Vegetative Fringe. The natural vegetative fringe along the Willamette River shall be protected and enhanced to the maximum extent practicable.

Applicant's Response: The project protects the existing vegetative fringe along the Willamette River and enhances it to the maximum extent practicable through preservation of existing vegetation and supplemental native planting appropriate to the existing rock outcropping and river corridor.

D. Directing Development Away from the River. Development shall be directed away from the Willamette River to the greatest possible degree, provided that lands committed to urban uses within the Greenway may continue as urban uses, subject to the nonconforming use provisions of Chapter 17.58 of this title.

Applicant's Response: Consistent with the Greenway standard, development is directed away from the Willamette River through replacement of an existing building within the previously developed footprint. The proposed building is located no closer to the river and is positioned farther from the steep bank and river corridor than the existing structure.

E. A Greenway Setback. In each application, the approving officer or body shall establish a setback to keep structures separated from the Willamette River in order to protect, maintain, preserve and enhance the natural scenic, historic and recreational qualities of the Willamette River Greenway, as set forth in the City comprehensive plan; provided, however, that the requirement to establish such setbacks shall not apply to water-related or water-dependent uses. No greenway setback standards shall apply for areas outside of the 150-foot Compatibility boundary.

Applicant's Response: Current setback from the low water line (location of line provided by Oregon Department of State Lands) is 104' following the topography up the steep hill to the north side of the building.

F. Other Applicable Standards. The Oregon Department of Transportation Greenway Plan, the Greenway portions of the City comprehensive plan, the Willamette River Greenway statutes and the provisions of

Statewide Planning Goal 15, shall also be considered in actions involving Willamette River Greenway permits.

Applicant's Response: The project has been reviewed for consistency with the Oregon Department of Transportation Greenway Plan, the Greenway policies of the OC2040 Comprehensive Plan, applicable Willamette River Greenway statutes, and Statewide Planning Goal 15. OC2040 recognizes the Willamette River Greenway as an important natural and scenic resource for Oregon City and establishes policies to protect and enhance this corridor, including preserving vegetated areas, scenic views, and fish and wildlife habitat, and encouraging appropriate public access consistent with local park planning.

Statewide Planning Goal 15 is intended to protect, conserve, enhance, and maintain the natural, scenic, recreational, and ecological qualities of the Willamette River Greenway while allowing urban uses consistent with local plans and regulations. The proposed development is consistent with these objectives by directing development away from the river relative to existing conditions, preserving and enhancing vegetated areas within the river corridor, and accommodating future public access consistent with adopted plans.

17.48.100 - Compatibility review.
A. In all areas within one hundred fifty feet of the Oregon Department of State Lands' mapped ordinary low-water line of the Willamette River, hereinafter referred to as the "compatibility boundary," the provisions of this subsection shall be applicable to all developments and changes or intensification of uses, so as to ensure their compatibility with Oregon's Greenway statutes, and to assure that the best possible appearance, landscaping and public access be provided.

Applicant's Response: As the project is located within the 150-foot compatibility boundary, the development has been carefully designed to ensure compatibility with Oregon's Greenway statutes. Building placement, landscape treatment, and site design emphasize visual quality, protection of the river environment, and accommodation of public access consistent with applicable Greenway standards.

B. All development or changes or intensifications of uses in the compatibility area shall be approved only if the following findings are made by the Planning Commission through a Type III review process pursuant to OCMC 17.50.
1. That to the greatest extent possible, the development or change or intensification of use provides for the maximum possible landscaped area, open space or vegetation between the activity and the river.

Applicant's Response: The proposed project provides the maximum practicable landscaped area and vegetation between the development and the Willamette River. A substantial existing vegetated bank between the development area and the river will be preserved and left undisturbed. In addition, the project incorporates new native landscaping between the proposed building and the top of the bank, increasing vegetative buffering relative to existing conditions.

Building placement within the previously developed portion of the site allows the majority of the river-facing area to remain in vegetated open space, thereby maximizing separation between development activity and the river corridor.

2. That to the greatest degree possible, necessary public access is provided to and along the Willamette River by appropriate legal means.

Applicant's Response: The project provides for necessary public access to and along the Willamette River to the greatest degree practicable through appropriate legal means, including preservation of required areas and provision of public access easements consistent with future plans including the McLoughlin Boulevard Enhancement Plan.

17.48.110 - Prohibited activities.
The following are prohibited within the Willamette River Greenway:
A. Structural bank protection, except rip rap or a channelization used as an emergency measure only to protect existing structures. Any such rip rap or channelization to stabilize undeveloped sites shall be prohibited as well;
B. Subsurface sewage disposal drain fields within one hundred feet of the ordinary mean low-water line of the Willamette River.

Applicant's Response: No activities prohibited by OCMC 17.48.110 are proposed as part of this development.

17.48.120 - Additional procedural requirements.
In addition to the requirements of Chapter 17.50, the following procedural requirements shall be applicable to all matters arising out of Sections 17.48.070 through 17.48.100:
A. Applications submitted for review under Sections 17.48.070 through 17.48.100 shall be accompanied by such materials as are reasonably necessary for adequate review, including, as necessary:
1. A site and landscaping plan showing existing vegetation and development and location of proposed development for activities;
2. Elevations of any proposed structures;
3. Materials list for any proposed structures, including type and colors of siding and roofing; and
4. Cross-sections of any area within the vegetative fringe where grading, filling, timber harvesting or excavating will occur.

Applicant's Response: A site plan is provided showing existing vegetation and proposed building outline as well as the existing footprint. Elevations and materials are not applicable for this proposal, and cross sections are not required because there is no grading/filling within the vegetative fringe identified.

B. Written notice, including a copy of the application, shall be sent immediately upon receipt to the Oregon Department of Transportation by certified mail, return receipt requested. The Oregon Department of Transportation shall have seven working days from the date of mailing to respond before a decision be rendered.
1. Written notice shall be given to the Oregon Department of Transportation by certified mail, return receipt requested, within seven days of the entry of a final order on the disposition of all applications made under Sections 17.48.070 through 17.48.100.

Applicant's Response: Per conversations with Planning staff, this notification will be via email and we will work with Staff to notify ODOT in a timely manner.

CHAPTER 17.50 – ADMINISTRATION AND PROCEDURES

17.50.010 Purpose.
This chapter provides the procedures by which Oregon City reviews and decides upon applications for all

permits relating to the use of land authorized by ORS 92, 197 and 227. These permits include all form of land divisions, land use, limited land use and expedited land division and legislative enactments and amendments to the Oregon City Comprehensive Plan and Titles 16 and 17 of this code. Pursuant to ORS 227.175, any applicant may elect to consolidate applications for two or more related permits needed for a single development project. Any grading activity associated with development shall be subject to preliminary review as part of the review process for the underlying development. It is the express policy of the City of Oregon City that development review not be segmented into discrete parts in a manner that precludes a comprehensive review of the entire development and its cumulative impacts.

17.50.030 Summary of the City's decision-making processes.

The following decision-making processes chart shall control the City's review of the indicated permits:

Table 17.50.030 – Permit Approval Process

Permit Type	***I***	***II***	***III***	***IV***	***Expedited Land Division***
Annexation				*X*	
Compatibility review for communication facilities	*X*				
Compatibility review for the Willamette Greenway Overlay District			*X*		
Code Interpretation			*X*

Natural resource overlay district review		*X*	*X*		
Nonconforming use, structure and lots review	*X*	*X*			

Placement of a single manufactured home on existing space or lot within a park	*X*				
Plan or code amendment					*X*
Residential design standards review for single-family detached, duplexes, triplexes, quadplexes, townhouses, cottage clusters and accessory dwelling units (uses minor site plan and design review)	*X*				
Revocation					*X*
Site plan and design review	*X*	*X*			
Subdivision		*X*			*X*
Variance		*X*	*X*		
Zone Change				*X*	

**If any provision or element of the master plan/planned unit development requires a deferred Type III procedure, the detailed development plan shall be processed through a Type III procedure.*

A. Type I decisions do not require interpretation or the exercise of policy or legal judgment in evaluating approval criteria. Because no discretion is involved, Type I decisions do not qualify as a land use, or limited land use, decision. The decision-making process requires no notice to any party other than the applicant. The Community Development Director's decision is final and not appealable by any party through the normal city land use process.

B. Type II decisions involve the exercise of limited interpretation and discretion in evaluating approval criteria, similar to the limited land use decision-making process under state law. Applications evaluated through this process are assumed to be allowable in the underlying zone, and the inquiry typically focuses on what form the use will take or how it will look. Notice of application and an invitation to comment is mailed to the applicant, recognized active neighborhood association(s) and property owners within three hundred feet. The Community Development Director accepts comments for a minimum of fourteen days and renders a decision. The Community Development Director's decision is appealable to the City Commission, by any party who submitted comments in writing before the expiration of the comment period. Review by the City Commission shall be on the record pursuant to OCMC 17.50.190 under ORS 197.195(5). The City Commission decision is the City's final decision and is subject to review by the land use board of appeals (LUBA) within twenty-one days of when it becomes final.

C. Type III decisions involve the greatest amount of discretion and evaluation of subjective approval standards, yet are not required to be heard by the City Commission, except upon appeal. In the event that any decision is not classified, it shall be treated as a Type III decision. The process for these land use decisions is controlled by ORS 197.763. Notice of the application and the Planning Commission or the Historic Review Board hearing is published and mailed to the applicant, recognized neighborhood association(s) and property owners within three hundred feet. Notice shall be issued at least twenty days pre-hearing, and the staff report shall be available at least seven days pre-hearing. At the evidentiary hearing held before the Planning Commission or the Historic Review Board, all issues are addressed. The decision of the Planning Commission or Historic Review Board is appealable to the City Commission, on the record pursuant to OCMC 17.50.190. The City Commission decision on appeal from is the City's final decision and is subject to review by LUBA within twenty-one days of when it becomes final, unless otherwise provided by state law.

D. Type IV decisions include only quasi-judicial plan amendments and zone changes. These applications involve the greatest amount of discretion and evaluation of subjective approval standards and shall be

heard by the City Commission for final action. The process for these land use decisions is controlled by ORS 197.763. Notice of the application and Planning Commission hearing is published and mailed to the applicant, recognized neighborhood association(s) and property owners within three hundred feet. Notice shall be issued at least twenty days pre-hearing, and the staff report shall be available at least seven days pre-hearing. At the evidentiary hearing held before the Planning Commission, all issues are addressed. If the Planning Commission denies the application, any party with standing (i.e., anyone who appeared before the Planning Commission either in person or in writing within the comment period) may appeal the Planning Commission denial to the City Commission. If the Planning Commission denies the application and no appeal has been received within fourteen days of the issuance of the final decision, then the action of the Planning Commission becomes the final decision of the City. If the Planning Commission votes to approve the application, that decision is forwarded as a recommendation to the City Commission for final consideration. In either case, any review by the City Commission is on the record and only issues raised before the Planning Commission may be raised before the City Commission. The City Commission decision is the City's final decision and is subject to review by LUBA within twenty-one days of when it becomes final.
E. Expedited land divisions and middle housing land divisions are subject to the requirements of OCMC 16.24.The expedited land division (ELD) process is set forth in ORS 197.360 to 197.380.
F. Decisions, completeness reviews, appeals, and notices in this chapter shall be calculated according to OCMC 1.04.070 and shall be based on calendar days, not business days.

17.50.040 Development review in overlay districts and for erosion control.
For any development subject to regulation of geologic hazards overlay district under OCMC 17.44; natural resource overlay district under OCMC 17.49; Willamette River Greenway Overlay District under OCMC 17.48; historic overlay district under OCMC 17.40, and erosion and sediment control under OCMC 17.47, compliance with the requirements of these chapters shall be reviewed as part of the review process required for the underlying development for the site.

17.50.050 – Pre-application conference.
A. Pre-application Conference. Prior to a Type II – IV or Legislative application, excluding Historic Review, being deemed complete, the applicant shall schedule and attend a pre-application conference with City staff to discuss the proposal, unless waived by the Community Development Director. The purpose of the pre-application conference is to provide an opportunity for staff to provide the applicant with information on the likely impacts, limitations, requirements, approval standards, fees and other information that may affect the proposal.
1. To schedule a pre-application conference, the applicant shall contact the Planning Division, submit the required materials, and pay the appropriate conference fee.
2. At a minimum, an applicant should submit a short narrative describing the proposal and a proposed site plan, drawn to a scale acceptable to the City, which identifies the proposed land uses, traffic circulation, and public rights-of-way and all other required plans.
3. The Planning Division shall provide the applicant(s) with the identity and contact persons for all affected neighborhood associations as well as a written summary of the pre-application conference.

Applicant's Response: Pre-application conference was held November 19, 2025.

B. A pre-application conference shall be valid for a period of six months from the date it is held. If no application is filed within six months of the conference or meeting, the applicant shall schedule and attend another conference before the City will accept a permit application. The Community Development Director may waive the pre-application requirement if, in the Director's opinion, the development has not

changed significantly and the applicable municipal code or standards have not been significantly amended. In no case shall a pre-application conference be valid for more than one year.

Applicant's Response: The application was submitted within six months of the pre-application conference held on 11/19/25. Therefore, the pre-application conference remains valid and no additional conference is required.

C. Notwithstanding any representations by City staff at a pre-application conference, staff is not authorized to waive any requirements of this code, and any omission or failure by staff to recite to an applicant all relevant applicable land use requirements shall not constitute a waiver by the City of any standard or requirement.

Applicant's Response: The applicant acknowledges that any information provided by City staff during the pre-application conference does not constitute a waiver of applicable code requirements and that the proposal is subject to full compliance with all relevant standards and approval criteria.

17.50.055 - Neighborhood association meeting.
Neighborhood Association Meeting. The purpose of the meeting with the recognized neighborhood association is to inform the affected neighborhood association about the proposed development and to receive the preliminary responses and suggestions from the neighborhood association and the member residents.
A. Applicants applying for annexations, zone change, comprehensive plan amendments, conditional use, Planning Commission variances, subdivision, or site plan and design review (excluding minor site plan and design review), general development master plans or detailed development plans applications shall schedule and attend a meeting with the City-recognized neighborhood association in whose territory the application is proposed no earlier than one year prior to the date of application. Although not required for other projects than those identified above, a meeting with the neighborhood association is highly recommended.
B. The applicant shall request via email or regular mail a request to meet with the neighborhood association chair where the proposed development is located. The notice shall describe the proposed project. A copy of this notice shall also be provided to the chair of the citizen involvement committee.
C. A meeting shall be scheduled within thirty days of the date that the notice is sent. A meeting may be scheduled later than thirty days if by mutual agreement of the applicant and the neighborhood association. If the neighborhood association does not want to, or cannot meet within thirty days, the applicant shall host a meeting inviting the neighborhood association, citizen involvement committee, and all property owners within three hundred feet to attend. This meeting shall not begin before six p.m. on a weekday or may be held on a weekend and shall occur within the neighborhood association boundaries or at a city facility.
D. If the neighborhood association is not currently recognized by the City, is inactive, or does not exist, the applicant shall request a meeting with the citizen involvement committee.
E. To show compliance with this section, the applicant shall submit a copy of the email or mail notice to the neighborhood association and CIC chair, a sign-in sheet of meeting attendees, and a summary of issues discussed at the meeting. If the applicant held a separately noticed meeting, the applicant shall submit a copy of the meeting flyer, postcard or other correspondence used, and a summary of issues discussed at the meeting and submittal of these materials shall be required for a complete application.

Applicant's Response: Applicant met with the Two Rivers Neighborhood Association to present the development proposal on October 22, 2025. Prior meetings with the Two Rivers Neighborhood

Association were also held on February 18, 2025, and April 23, 2025. In addition, applicant also met with Citizen Involvement Committee on November 3, 2025 to present the development proposal.

17.50.060 Application requirements.
A permit application may only be initiated by the record property owner or contract purchaser, the City Commission or Planning Commission. If there is more than one record owner, then the City will not complete a Type II—IV application without signed authorization from all record owners. All permit applications shall be submitted on the form provided by the City, along with the appropriate fee and all necessary supporting documentation and information, sufficient to demonstrate compliance with all applicable approval criteria. The applicant has the burden of demonstrating, with evidence, that all applicable approval criteria are, or can be, met.

Applicant's Response: Level OCC-01 LLC is the applicant for this application and is authorized to submit the application on behalf of the property owner, Clackamas County. This application has been submitted in accordance with OCMC 17.50.060, with authorization from the record property owner, and includes all required forms, fees, and supporting documentation necessary to demonstrate compliance with applicable approval criteria.

17.50.070 Completeness review and one hundred twenty-day rule.
A. Upon submission, the Community Development Director shall date stamp the application form and verify that all of the appropriate application review fee(s) have been submitted. Upon receipt of all review fees and an application form, the Community Development Director will then review the application and all information submitted with it and evaluate whether the application is complete enough to process. Within thirty days of receipt of the application and all applicable review fees, the Community Development Director shall complete this initial review and issue to the applicant a written statement indicating whether the application is complete enough to process, and if not, what information shall be submitted to make the application complete.

B. The applicant has one hundred eighty days from the date the application was made to submit the missing information or the application shall be rejected and the unused portion of the application fee returned to the applicant. If the applicant submits the requested information within the one hundred eighty-day period, the Community Development Director shall again verify whether the application, as augmented, is complete. Each such review and verification shall follow the procedure in subsection A of this section.

The application will be deemed complete for the purpose of this section upon receipt by the Community Development Director of:
1. All the missing information;
2. Some of the missing information and written notice from the applicant that no other information will be provided; or
3. Written notice from the applicant that none of the missing information will be provided.

C. Once the Community Development Director determines the application is complete enough to process, or the applicant refuses to submit any more information, the City shall declare the application complete. Pursuant to ORS 227.178, the City will reach a final decision on an application within one hundred twenty calendar days from the date that the application is determined to be or deemed complete unless the applicant agrees to suspend the one hundred twenty-calendar-day timeline or unless state law provides otherwise. The one hundred twenty-day period, however, does not apply in the following situations:

1. Any hearing continuance or other process delay requested by the applicant shall be deemed an extension or waiver, as appropriate, of the one hundred twenty-day period.
2. Any delay in the decision-making process necessitated because the applicant provided an incomplete set of mailing labels for the record property owners within three hundred feet of the subject property shall extend the one hundred twenty-day period for the amount of time required to correct the notice defect.
3. The one hundred twenty-day period does not apply to any application for a permit that is not wholly within the City's authority and control.
4. The one hundred twenty-day period does not apply to any application for an amendment to the City's comprehensive plan or land use regulations nor to any application for a permit, the approval of which depends upon a plan amendment.

D. A one hundred day-period applies in place of the one hundred twenty-day period for affordable housing projects where:
1. The project includes five or more residential units, including assisted living facilities or group homes;
2. At least fifty percent of the residential units will be sold or rented to households with incomes equal to or less than sixty percent of the median family income for Clackamas County or for the state, whichever is greater; and
3. Development is subject to a covenant restricting the owner and successive owner from selling or renting any of the affordable units as housing that is not affordable for a period of sixty years from the date of the certificate of occupancy.
E. The one hundred twenty-day period specified in OCMC 17.50.070.C or D may be extended for a specified period of time at the written request of the applicant. The total of all extensions may not exceed two hundred forty-five calendar days.
F. The approval standards that control the City's review and decision on a complete application are those which were in effect on the date the application was first submitted.

Applicant's Response: The application has been submitted in accordance with OCMC 17.50.070 and will be reviewed for completeness and processed within the applicable statutory timelines.

17.50.080 Complete application—Required information.
Unless stated elsewhere in OCMC 16 or 17, a complete application includes all the materials listed in this subsection. The Community Development Director may waive the submission of any of these materials if not deemed to be applicable to the specific review sought. Likewise, within thirty days of when the application is first submitted, the Community Development Director may require additional information, beyond that listed in this subsection or elsewhere in Titles 12, 14, 15, 16, or 17, such as a traffic study or other report prepared by an appropriate expert. In any event, the applicant is responsible for the completeness and accuracy of the application and all of the supporting documentation, and the City will not deem the application complete until all information required by the Community Development Director is submitted. At a minimum, the applicant shall submit the following:

A. One copy of a completed application form that includes the following information:
1. An accurate address and tax map and location of all properties that are the subject of the application;
2. Name, address, telephone number and authorization signature of all record property owners or contract owners, and the name, address and telephone number of the applicant, if different from the property owner(s);
B. A complete list of the permit approvals sought by the applicant;
C. A complete and detailed narrative description of the proposed development;

D. A discussion of the approval criteria for all permits required for approval of the development proposal that explains how the criteria are or can be met or are not applicable, and any other information indicated by staff at the pre-application conference as being required;
E. One copy of all architectural drawings and site plans shall be submitted for Type II—IV applications. One paper copy of all application materials shall be submitted for Type I applications;

F. For all Type II—IV applications, the following is required:
1. An electronic copy of all materials.
2. Mailing labels or associated fee for notice to all parties entitled under OCMC 17.50.090 to receive mailed notice of the application. The applicant shall use the names and addresses of property owners within the notice area indicated on the most recent property tax rolls.
3. Documentation indicating there are no liens favoring the City on the subject site.
4. A receipt from the county assessor's office indicating that all taxes for the lot or parcels involved are paid in full for the preceding tax year.
5. A current preliminary title report or trio for the subject property(ies);

G. All required application fees;
H. Annexation agreements, traffic or technical studies (if applicable);
I. Additional documentation, as needed and identified by the Community Development Director.

Applicant's Response: Applicable information required above will be submitted as part of the overall application.

17.50.090 - Public notices.
All public notices issued by the City announcing applications or public hearings of quasi-judicial or legislative actions, shall comply with the requirements of this section.
A. Notice of Type II Applications. Once the Community Development Director has deemed a Type II application complete, the City shall prepare and send notice of the application, by first class mail, to all record owners of property within three hundred feet of the subject property and to any city-recognized neighborhood association whose territory includes the subject property. The applicant shall provide or the City shall prepare for a fee an accurate and complete set of mailing labels for these property owners and for posting the subject property with the City-prepared notice in accordance with OCMC 17.50.100. The City's Type II notice shall include the following information:
1. Street address or other easily understood location of the subject property and city-assigned planning file number;
2. A description of the applicant's proposal, along with citations of the approval criteria that the City will use to evaluate the proposal;
3. A statement that any interested party may submit to the City written comments on the application during a fourteen-day comment period prior to the City's deciding the application, along with instructions on where to send the comments and the deadline of the fourteen-day comment period;
4. A statement that any issue which is intended to provide a basis for an appeal shall be raised in writing during the fourteen-day comment period with sufficient specificity to enable the City to respond to the issue;
5. A statement that the application and all supporting materials may be inspected, and copied at cost, at City Hall during normal business hours;
6. The name and telephone number of the planning staff person assigned to the application or is otherwise available to answer questions about the application;

7. The notice shall state that a city-recognized neighborhood association requesting an appeal fee waiver pursuant to OCMC 17.50.290.C must officially approve the request through a vote of its general membership or board at a duly announced meeting prior to the filing of an appeal.

Applicant's Response: Proposal is not a Type II process, therefore this standard does not apply**.**

B. Notice of Public Hearing on a Type III or IV Quasi-Judicial Application. Notice for all public hearings concerning a quasi-judicial application shall conform to the requirements of this subsection. At least twenty days prior to the hearing, the City shall prepare and send, by first class mail, notice of the hearing to all record owners of property within three hundred feet of the subject property and to any city-recognized neighborhood association whose territory includes the subject property. The City shall also publish the notice on the City website within the City at least twenty days prior to the hearing. Pursuant to OCMC 17.50.080.H, the applicant is responsible for providing an accurate and complete set of mailing labels for these property owners and for posting the subject property with the City-prepared notice in accordance with OCMC 17.50.100. Notice of the application hearing shall include the following information:
1. The time, date and location of the public hearing;
2. Street address or other easily understood location of the subject property and city-assigned planning file number;
3. A description of the applicant's proposal, along with a list of citations of the approval criteria that the City will use to evaluate the proposal;
4. A statement that any interested party may testify at the hearing or submit written comments on the proposal at or prior to the hearing and that a staff report will be prepared and made available to the public at least seven days prior to the hearing;
5. A statement that any issue which is intended to provide a basis for an appeal to the City Commission shall be raised before the close of the public record. Issues must be raised and accompanied by statements or evidence sufficient to afford the City and all parties to respond to the issue;
6. The notice shall state that a city-recognized neighborhood association requesting an appeal fee waiver pursuant to OCMC 17.50.290.C must officially approve the request through a vote of its general membership or board at a duly announced meeting prior to the filing of an appeal;
7. A statement that the application and all supporting materials and evidence submitted in support of the application may be inspected at no charge and that copies may be obtained at reasonable cost at the planning division offices during normal business hours; and
8. The name and telephone number of the planning staff person responsible for the application or is otherwise available to answer questions about the application.

Applicant's Response: Acknowledging Type III procedure is applicable to this project proposal.

C. Notice of Public Hearing on a Legislative Proposal. At least twenty days prior to a public hearing at which a legislative proposal to amend or adopt the City's land use regulations or comprehensive plan is to be considered, the Community Development Director shall issue a public notice that conforms to the requirements of this subsection. Notice shall be sent to affected governmental entities, special districts, providers of urban services, including Tri-Met, Oregon Department of Transportation and Metro, any affected recognized neighborhood associations and any party who has requested in writing such notice. Notice shall also be published on the City website. Notice issued under this subsection shall include the following information:
1. The time, date and location of the public hearing;
2. The City-assigned planning file number and title of the proposal;

3. A description of the proposal in sufficient detail for people to determine the nature of the change being proposed;
4. A statement that any interested party may testify at the hearing or submit written comments on the proposal at or prior to the hearing; and
5. The name and telephone number of the planning staff person responsible for the proposal and who interested people may contact for further information.

Applicant's Response: Proposal is not legislative, therefore this standard does not apply**.**

17.50.100 - Notice posting requirements.
Where this chapter requires notice of a pending or proposed permit application or hearing to be posted on the subject property, the requirements of this section shall apply.
A. City Guidance and the Applicant's Responsibility. The City shall supply all of the notices which the applicant is required to post on the subject property and shall specify the dates the notices are to be posted and the earliest date on which they may be removed. The City shall also provide a statement to be signed and returned by the applicant certifying that the notice(s) were posted at the correct time and that if there is any delay in the City's land use process caused by the applicant's failure to correctly post the subject property for the required period of time and in the correct location, the applicant agrees to extend the applicable decision-making time limit in a timely manner.
B. Number and Location. The applicant shall place the notices on each frontage of the subject property. If the property's frontage exceeds six hundred feet, the applicant shall post one copy of the notice for each six hundred feet or fraction thereof. Notices do not have to be posted adjacent to alleys or unconstructed right-of-way. Notices shall be posted within ten feet of the street and shall be visible to pedestrians and motorists. Notices shall not be posted within the public right-of-way or on trees. The applicant shall remove all signs within ten day following the event announced in the notice.

Applicant's Response: Acknowledging posting of site is applicable to this project proposal.

7.50.110 Assignment of decision-makers.
The following City entity or official shall decide the following types of applications:
A. Type I Decisions. The Community Development Director shall render all Type I decisions. The Community Development Director's decision is the City's final decision on a Type I application.
B. Type II Decisions. The Community Development Director shall render the City's decision on all Type II permit applications, which are then appealable to the City Commission with notice to the Planning Commission. The City's final decision is subject to review by LUBA.
C. Type III Decisions. The Planning Commission or Historic Review Board, as applicable, shall render all Type III decisions. Such decision is appealable to the City Commission, on the record. The City Commission 's decision is the city's final decision and is subject to review by LUBA within twenty-one days of when it becomes final.
D. Type IV Decisions. The Planning Commission shall render the initial decision on all Type IV permit applications. If the Planning Commission denies the Type IV application, that decision is final unless appealed in accordance with OCMC 17.50.190. If the Planning Commission recommends approval of the application, that recommendation is forwarded to the City Commission. The City Commission decision is the City's final decision on a Type IV application and is subject to review LUBA.
E. Expedited Land Division (ELD). The Community Development Director shall render the initial decision on all ELD applications. The Community Development Director's decision is the City's final decision unless appealed in accordance to ORS 197.375 to a City-appointed hearings referee. The hearings referee decision is the City's final decision which is appealable to the Oregon Court of Appeals.

Applicant's Response: Acknowledging Type III decisions are applicable to this project proposal.

17.50.120 Quasi-judicial hearing process.

All public hearings pertaining to quasi-judicial permits, whether before the Planning Commission, Historic Review Board, or City Commission, shall comply with the procedures of this section. In addition, all public hearings held pursuant to this chapter shall comply with the Oregon Public Meetings Law, the applicable provisions of ORS 197.763 and any other applicable law.

A. Once the Community Development Director determines that an application for a Type III or IV decision is complete, the planning division shall schedule a hearing before the Planning Commission or Historic Review Board, as applicable. Once the Community Development Director determines that an appeal of a Type II, Type III or Type IV decision has been properly filed under OCMC 17.50.190, the planning division shall schedule a hearing pursuant to OCMC 17.50.190.

B. Notice of the Type III or IV hearing shall be issued at least twenty days prior to the hearing in accordance with OCMC 17.50.090.B.

C. Written notice of an appeal hearing shall be sent by regular mail no later than fourteen days prior to the date of the hearing to the appellant, the applicant if different from the appellant, the property owner(s) of the subject site, all persons who testified either orally or in writing before the hearing body and all persons that requested in writing to be notified.

D. The Community Development Director shall prepare a staff report on the application which lists the applicable approval criteria, describes the application and the applicant's development proposal, summarizes all relevant city department, agency and public comments, describes all other pertinent facts as they relate to the application and the approval criteria and makes a recommendation as to whether each of the approval criteria are met.

E. At the beginning of the initial public hearing at which any quasi-judicial application or appeal is reviewed, a statement describing the following shall be announced to those in attendance:

1. That the hearing will proceed in the following general order: Staff report, applicant's presentation, testimony in favor of the application, testimony in opposition to the application, rebuttal, record closes, commission deliberation and decision;

2. That all testimony and evidence submitted, orally or in writing, shall be directed toward the applicable approval criteria. If any person believes that other criteria apply in addition to those addressed in the staff report, those criteria shall be listed and discussed on the record. The meeting chairperson may reasonably limit oral presentations in length or content depending upon time constraints. Any party may submit written materials of any length while the public record is open;

3. Failure to raise an issue on the record with sufficient specificity and accompanied by statements or evidence sufficient to afford the City and all parties to respond to the issue, will preclude appeal on that issue to the land use board of appeals;

4. Any party wishing a continuance or to keep open the record shall make that request while the record is still open;

5. That the commission chair shall call for any ex-parte contacts, conflicts of interest or bias before the beginning of each hearing item; and

6. For appeal hearings, only those persons who participated either orally or in writing in the decision or review will be allowed to participate either orally or in writing on the appeal.

F. Requests for continuance and to keep open the record: The hearing may be continued to allow the submission of additional information or for deliberation without additional information. New notice of a continued hearing need not be given so long as a time-certain and location is established for the continued hearing. Similarly, hearing may be closed but the record kept open for the submission of

additional written material or other documents and exhibits. The chairperson may limit the factual and legal issues that may be addressed in any continued hearing or open record period.

Applicant's Response: Acknowledging the quasi-judicidial process is applicable to this project proposal

17.50.130 Conditions of approval and notice of decision.
A. All City decision-makers have the authority to impose reasonable conditions of approval designed to ensure that all applicable approval standards, including standards set out in city overlay districts, the City's master plans, and City public works design standards, are, or can be met.
B. Failure to comply with any condition of approval shall be grounds for revocation of the permit(s) and grounds for instituting code enforcement proceedings pursuant to OCMC 1.20 of this code and ORS 30.315.

C. Notice of Decision. The City shall send, by first class mail, a notice of all decisions rendered under this chapter to all persons with standing, i.e., the applicant, all others who participated either orally or in writing before the close of the public record and those who specifically requested notice of the decision. The notice of decision shall include the following information:
1. The file number and date of decision;
2. The name of the applicant, owner and appellant (if different);
3. The street address or other easily understood location of the subject property;
4. A brief summary of the decision, and if an approval, a description of the permit approved;
5. A statement that the decision is final unless appealed and description of the requirements for perfecting an appeal;
6. The contact person, address and a telephone number whereby a copy of the final decision may be inspected or copies obtained.

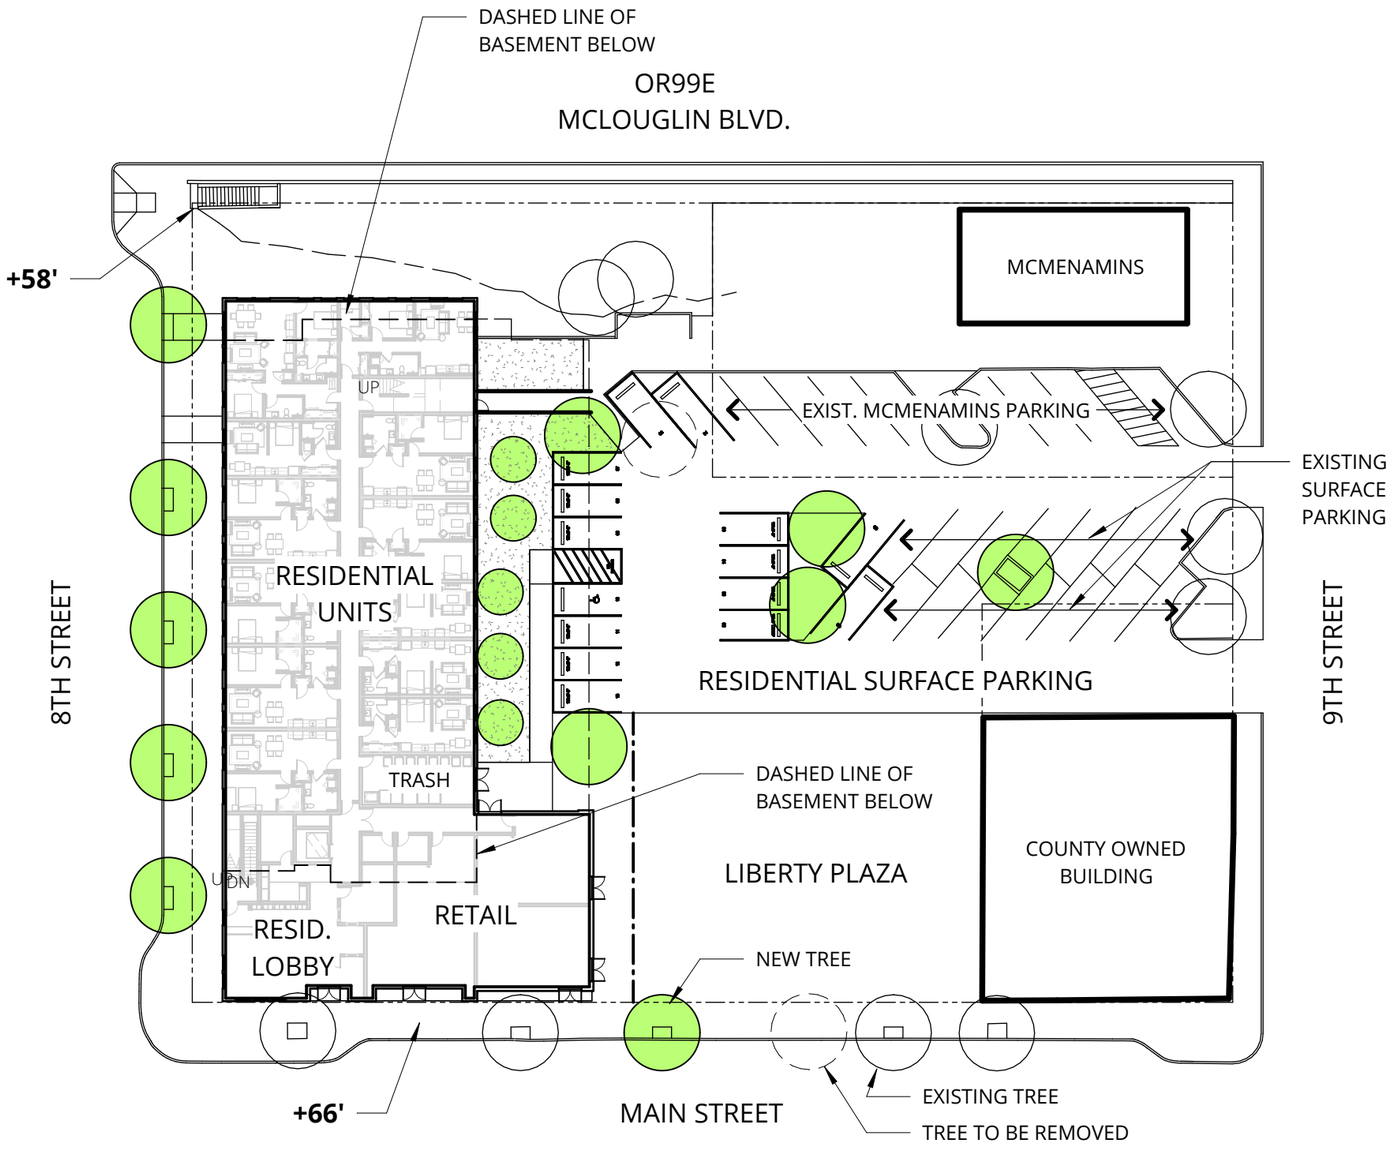
D. Modification of Conditions. Any request to modify a condition of permit approval is to be considered either minor modification or a major modification, unless otherwise authorized. A minor modification shall be processed as a Type I. A major modification shall be processed in the same manner and shall be subject to the same standards as was the original application. However, the decision-maker may at their sole discretion, consider a modification request and limit its review of the approval criteria to those issues or aspects of the application that are proposed to be changed from what was originally approved.

Applicant's Response: Modification of conditions are not anticipated at this time.

17.50.140 – Financial guarantees.
When conditions of permit approval require a permitee to construct certain public improvements, the City shall require the permitee to provide financial guarantee for construction of the certain public improvements. Financial guarantees shall be governed by this section.
A. Form of Guarantee. Guarantees shall be in a form approved by the City attorney. Approvable forms of guarantee include irrevocable standby letters of credit to the benefit of the City issued by a recognized lending institution, certified checks, dedicated bank accounts or allocations of construction loans held in reserve by the lending institution for the benefit of the City. The form of guarantee shall be specified by the City engineer and, prior to execution and acceptance by the City shall be reviewed and approved by the City attorney. The guarantee shall be filed with the City engineer.
B. Performance Guarantees. A permittee shall be required to provide a performance guarantee as follows.

1. After Final Approved Design by the City. The City may request the permittee to submit a performance guarantee for construction of certain public improvements. A permitee may request the option of submitting a performance guarantee when prepared for temporary/final occupancy. The guarantee shall be one hundred twenty percent of the estimated cost of constructing the public improvements as submitted by the permittee's engineer. The engineer's estimated costs shall be supported by a verified engineering estimate and approved by the City engineer.
2. Before Complete Design Approval and Established Engineered Cost Estimate. The City may request a permittee to submit a performance guarantee for construction of certain public improvements. A permitee may request the option of submitting a performance guarantee before public improvements are designed and completed. The guarantee shall be one hundred fifty percent of the estimated cost of constructing the public improvements as submitted by the permittee's engineer and approved by the City engineer. The engineer's estimated costs shall be supported by a verified engineering estimate and approved by the City engineer.

C. Release of Guarantee. The guarantee shall remain in effect until the improvement is actually constructed and accepted by the City. Once the City has inspected and accepted the improvement, the City shall release the guarantee to the permittee. If the improvement is not completed to the City's satisfaction within the time limits specified in the permit approval, the City engineer may, at their discretion, draw upon the guarantee and use the proceeds to construct or complete construction of the improvement and for any related administrative and legal costs incurred by the City in completing the construction, including any costs incurred in attempting to have the permittee complete the improvement. Once constructed and approved by the City, any remaining funds shall be refunded to the permittee. The City shall not allow a permittee to defer construction of improvements by using a performance guarantee, unless the permittee agrees to construct those improvements upon written notification by the City, or at some other mutually agreed-to time. If the permittee fails to commence construction of the required improvements within six months of being instructed to do so, the City may, without further notice, undertake the construction of the improvements and draw upon the permittee's performance guarantee to pay those costs.



D. Fee-in-lieu. When conditions of approval or the City engineer allows a permittee to provide a fee-in-lieu of actual construction of public improvements, the fee shall be one hundred fifty percent of the estimated cost of constructing the public improvements as submitted by the permittee's engineer and approved by the City engineer. The percentage required is to ensure adequate funds for the future work involved in design, bid, contracting, and construction management and contract closeout. The engineer's estimated costs shall be supported by a verified engineering estimate and approved by the City engineer. The fee-in-lieu shall be submitted as cash, certified check, or other negotiable instrument acceptable by the City attorney.

Applicant's Response: This standard is not applicable to the requested Willamette River Greenway Overlay approval. The application is limited to clear and objective review under OCMC 17.48.100 and does not include approval of public improvements that would trigger financial guarantee requirements.

17.50.141 – Public improvements – Warranty
All public improvements not constructed by the City, shall be maintained and under warranty provided by the property owner or developer constructing the facilities until the City accepts the improvements at the end of the warranty period. The warranty is to be used at the discretion of the City engineer or designee to correct deficiencies in materials or maintenance of constructed public infrastructure, or to address any failure of engineering design.

A. Duration of Warranty. Responsibility for maintenance of public improvements shall remain with the property owner or developer for a warranty period of two years.
B. Financial Guarantee. Approvable forms of guarantee include irrevocable standby letters of credit to the benefit of the City issued by a recognized lending institution, bond, certified checks, dedicated bank accounts or allocations of construction loans held in reserve by the lending institution for the benefit of the City. The form of guarantee shall be specified by the City engineer and, prior to execution and acceptance by the City shall be reviewed and approved by the City attorney. The guarantee shall be filed with the City engineer.
C. Amount of Warranty. The amount of the warranty shall be equal to fifteen percent of the estimated cost of construction of all public improvements (including those improvements that will become owned and maintained by the City at the end of the two-year maintenance period), and shall be supported by a verified engineering estimate and approved by the City engineer. Upon expiration of the warranty period and acceptance by the City as described below, the City shall be responsible for maintenance of those improvements.
D. Transfer of Maintenance. The City will perform an inspection of all public improvements approximately forty-five days before the two-year warranty period expires. The public improvements shall be found to be in a clean, functional condition by the City engineer before acceptance of maintenance responsibility by the City. Transfer of maintenance of public improvements shall occur when the City accepts the improvements at the end of the two-year warranty period.

Applicant's Response: This standard is not applicable to the requested Willamette River Greenway Overlay approval. The application is limited to clear and objective review under OCMC 17.48.100 and does not include approval of public improvements that would trigger financial guarantee requirements.

Hello Christina,

Thank you for notifying ODOT of the application being reviewed under GLUA-26-00001/WRG-26-0001.

After review of the notice, ODOT understands the Site Plan and Design Review for the project will occur after this application is processed. Please anticipate ODOT comments at the time of Site Plan and Design Review. No ODOT comments for GLUA-26-00001/WRG-26-0001.

Thank you,
Melissa Gonzalez-Gabriel (she/her)

Good afternoon,

The Planning Division has received an application for a Type II land use decision.

On **Monday, March 9, 2026, the City of Oregon City Planning Commission** will conduct a public hearing at 7:00 p.m. in the Commission Chambers at the Robert Libke Public Safety Building, 1234 Linn Avenue, Oregon City, 97045, and virtually on the following Type III Application. Any interested party may testify at the public hearings or submit written testimony at or prior to the close of the Planning Commission hearing.

Please contact planning@orcity.org to provide virtual testimony. The meeting may be viewed live at www.youtube.com/user/CityofOregonCity. To be included in the staff report, written comments must be received by the Planning Division by 4 p.m., 2 weeks before the first scheduled hearing. Written comments received after that date will be provided to the Commission but may not be included in the staff report. The agenda and associated report will be posted at www.orcity.org/meetings one week prior to the meeting.

MEMORANDUM

TO: Christina Robertson-Gardiner, Senior Planner, Oregon City

FROM: Melissa Ryan, Assistant City Attorney

DATE: February 25, 2026

RE: 807 Main Street Application for Mixed Use Development

Introduction

The purpose of this memorandum is to explain the laws that the city can apply to an application for mixed use development with ground floor commercial and 84 units of housing on a property located within the Willamette River Greenway overlay, on the site of the vacated, former Clackamas County Courthouse.

Background

The application is for Willamette River Greenway review for a mixed-use space with ground-floor retail, 84 apartments, including a mix of studio, one-bedroom, and two-bedroom units; with amenities, support spaces, and off-street parking. The total proposed area is 83,000 square feet. The ground-floor retail space is 2,600 square feet and is directly adjacent to Liberty Plaza.

Discussion

A. Willamette River Greenway

In 1973, the Oregon Legislature enacted ORS 390.310 to 390.368, which "established the Willamette River Greenway, a corridor of protected land located along the banks of the river." *Gunderson, LLC v. City of Portland*, 352 Or 648, 650, 290 P3d 803 (2012). In 1975, the Oregon Parks and Recreation Department, the state agency vested with primary responsibility for the administration and maintenance of the Greenway, in coordination with nine counties and other local governments along the greenway, adopted Statewide Planning Goal 15 (Willamette River Greenway).

Goal 15 and the state's Greenway program require that each city and county in which the Greenway is located must incorporate portions of the state's Willamette River Greenway Plan into its comprehensive plan, implementing ordinances, and other implementing measures. As relevant to this application, those implementing measures must:

- "Insure that the best possible appearance, landscaping and public access are provided" within the Greenway,
- Ensure that to "the greatest possible degree" any "intensification, change of use or development will provide the maximum possible landscaped area, open space or vegetation between the activity and the river," and
- Ensure that that to "the greatest possible degree" "[n]ecessary public access will be provided to and along the river by appropriate legal means." Goal 15, Paragraph F(3).

Goal 15 requires that "lands committed to urban uses within the Greenway" shall be permitted to continue as urban uses, including commercial and residential uses. The city has adopted measures to implement Goal 15 in OCMC 17.48.

B. Clear and Objective Requirement for the Development Housing

ORS 197A.400(1)(a) (formerly ORS 197.307(4) (2015)) requires that a local government "may adopt and apply only clear and objective standards, conditions and procedures regulating [t]he development of housing." ORS 197A.400 applies to this mixed use application because it includes the development of housing. The term "clear" means "easily understood" and "without obscurity or ambiguity." The term "objective" means "existing independent of mind." *Nieto v. City of Talent*, LUBA No 2020-100, Mar 10, 2021.

A version of this statute was first enacted in 1981 and has been subsequently amended many times after. As explained below, when it was originally enacted, the statute provided that it applied to "needed housing on buildable land," which was defined as housing on buildable land for which there was a need identified in the local government's comprehensive plan. Lands within the Greenway were exempted in OAR 660-008-0005(2) from the definition of "buildable land," and thus exempt from the requirement to apply only clear and objective standards to an application for the

development of needed housing on buildable land. In 2017, in Senate Bill 1051, the legislature revised the statute to apply it to *all* housing, whether or not the housing was proposed on "buildable land."

OCMC 17.48.080 implements nearly word for word the "considerations" required in Goal 15(C)(3), and OCMC 17.48.100 includes nearly word for word the Greenway Compatibility Review requirements from Goal 15(F)(3)(b). The Goal 15 language and these city standards generally address preservation of access to the river; protection and enhancement of the vegetative fringe; directing development away from the river; establishment of a setback; and provision for a landscaped area, open space or vegetation between the development and the river. All of the city's standards mirror language in Goal 15 that has been determined in other non-Greenway contexts to not be "clear" or "objective:" "adequate" public access; "to the maximum extent practicable;" "to the greatest possible degree;" "the best possible;" and "to the greatest extent possible." Standards, conditions or procedures that involve subjective, value-laden analyses that are designed to balance or mitigate impacts of the development on the property to be developed or the adjoining properties or community are not "clear" or "objective." *Rogue Valley Assoc. of Realtors v. City of Ashland*, 35 Or LUBA 139, 158 (1998), *aff'd*, 158 Or App 1, 970 P2d 685, *rev den*, 328 Or 594, 987 P2d 514 (1999).

Conclusion

No LUBA or court decision has addressed whether there is an unresolvable conflict between the Greenway statutes and Goal 15's requirement to protect Greenway resources and values, on the one hand, and Senate Bill 1051's mandate that applications for housing may only be reviewed under clear and objective standards, on the other hand, and if so, which statute controls an application for residential development in the Greenway. Nevertheless, an applicant for housing may choose to seek approval under non-clear and objective standards, and the city may evaluate the application for compliance with such non-clear and objective Greenway standards and find that they are met. The application narrative recognizes that the values of the Greenway are also reflected as important values in the city's comprehensive plan and in the OCMC provisions that implement Goal 15. The application addresses each of the standards in OCMC 17.48 and takes the position that the application meets the standards. The city may evaluate the application's compliance with those non-clear and objective standards and conclude they are met.

Description of Physical and/or Landscape Features:

This is a three-story building with a full basement, much of which is fully exposed as a ground floor on the south and west elevations due to the slope of the landscape. It exemplifies the Art Deco style with its chevrons and stylistic sculptures, which include eagles surmounted on attached columns flanking the doors, scales symbolizing justic, and figures hold an "all-seeing eye" atop the corner piers. The exterior walls are sheathed with brick above the basement; the basement is sheathed with stone in a smooth ashlar rusticated finish. A beltcourse of stone with chevron detailing rings the building above the second floor windows. The east entrance is set off by stone surrounds. The north and south "wings" are set back slightly from the front and rear elevations. The interior includes oak trim, terrazzo floors and Tenessee marble wainscot. Alterations include the raising of the roof over the former jail area and the addition of a third floor to provide additional courtoorm space (1959), awnings over the entrances, and filling-in of some windows.

Statement of Significance: (use additional sheets if necessary)

Clackamas County was formed in 1843 by the Provisional Government. The first courthouse, built in 1850, burned in 1862. For the next 20 years, county business was conducted in various rented spaces downtown. An imposing, 2nd Empire style courthouse, designed by Neer and LaRomer, was constructed in 1884-1885 on the site of the present courthouse. By 1930, the building had become overcrowded and badly deteriorated and county officials began seeking funding for a new building. It was not until a PWA grant for $90,000 was received in 1935, however, that a new courthouse became a possibility. The new courthouse, an excellent example of the popular Art Deco style used for many public works projects during the Great Depression, was designed by architect F. Marion Stokes. Construction, which began in September 1936 and was completed in May 1937, was supervised by Glen L. Ford, a contractor from Portland. The building was constructed with 20,000 sacks of cement, 350,000 board feet of Clackamas County grown and manufactured lumber, and 90,000 bricks from Yamhill County. In keeping with the purpose of the federal relief-funded projects in the 1930s, the project created employment for dozens of people and resulted in 83,121 hours of labor. The total cost of the project was $273,000. This building should be considered eligible not only as a contributing resource in a historic district, but also as an individually eligible resource. Although there have been some alterations to the building, they have been mostly sensitive to the historic appearance and have not seriously affected the integrity of the building. As an individually eligible resource, the courthouse would be eligible as the only example of an Art Deco building in downtown Oregon City and as a nearly intact example of a public works project funded in part by a federal relief program (PWA) which provided assistance to communities throughout the country.

ORDINANCE NO. 24-1014

AN ORDINANCE OF THE CITY OF OREGON CITY AMENDING THE OREGON CITY TRANSPORTATION SYSTEM PLAN BY ADOPTING THE MCLOUGHLIN BLVD ENHANCEMENT PHASE 3 CORRIDOR PLAN

WHEREAS, McLoughlin Blvd Enhancements (Phase 3) will be added to the Oregon City Transportation System Plan (TSP), a technical document and conceptual guide that needs regular review and is an ancillary document to the Oregon City Comprehensive Plan, and

WHEREAS, the City of Oregon City and the Oregon Department of Transportation (ODOT) are partnering to evaluate options for a shared-use pedestrian and bicycle path and streetscape enhancements on both sides of McLoughlin Boulevard between 10th Street and tumwata village/Railroad Avenue.

WHEREAS, this is the last and most complex phase of Oregon City's McLoughlin Boulevard Enhancement Plan, which has been in progress for the past 20 years.; and

WHEREAS, the plan aims to ensure safe access for pedestrians, transit users, and cyclists on McLoughlin Boulevard, improve infrastructure to address transportation gaps and enhance Oregon City's tourism, economy, and community by better connecting downtown to the Willamette River; and

WHEREAS, this conceptual project will enable the City to complete the Alternatives Identification and Evaluation phase to determine how to address this gap, apply for grants to proceed with a more detailed design and build portions of the section; and

WHEREAS, the Planning Commission held a public hearing on October 28, 2024, and recommended approval of the proposed plan to the City Commission; and

WHEREAS, the City Commission held a public hearing on November 20, 2024 and found that the proposed plan complies with the applicable criteria for Legislative approval as discussed in the Staff Report and Recommended Findings for File LEG-24-00002

NOW, THEREFORE, OREGON CITY ORDAINS AS FOLLOWS:

Section 1. The City of Oregon City Transportation System Plan has been amended to adopt the McLoughlin Blvd Enhancements (Phase 3) as provided in the attached Exhibits "1 and 1A"

Section 2. The Legislative action taken by the Ordinance is explained and justified by the Analysis and Findings for GLUA 24-000023:LEG-24-00002

Read for the first time at a regular meeting of the City Commission held on the 20th Day of November, 2024, and the City Commission finally enacted the foregoing ordinance this 4th day of December, 2024.

Denyse C. McGriff, Mayor

Attested to this 4th day of December 2024:

City Recorder

Approved as to legal sufficiency:

City Attorney

Chapter 1: Background

Connecting downtown Oregon City to the waterfront for people walking and biking is a dream that has been several decades in the making. Two segments of a waterfront path have already been built, connecting downtown Oregon City with the pathway along the Clackamas River. The last critical gap is McLoughlin Boulevard (OR99E) between 10th Street and Railroad Avenue.

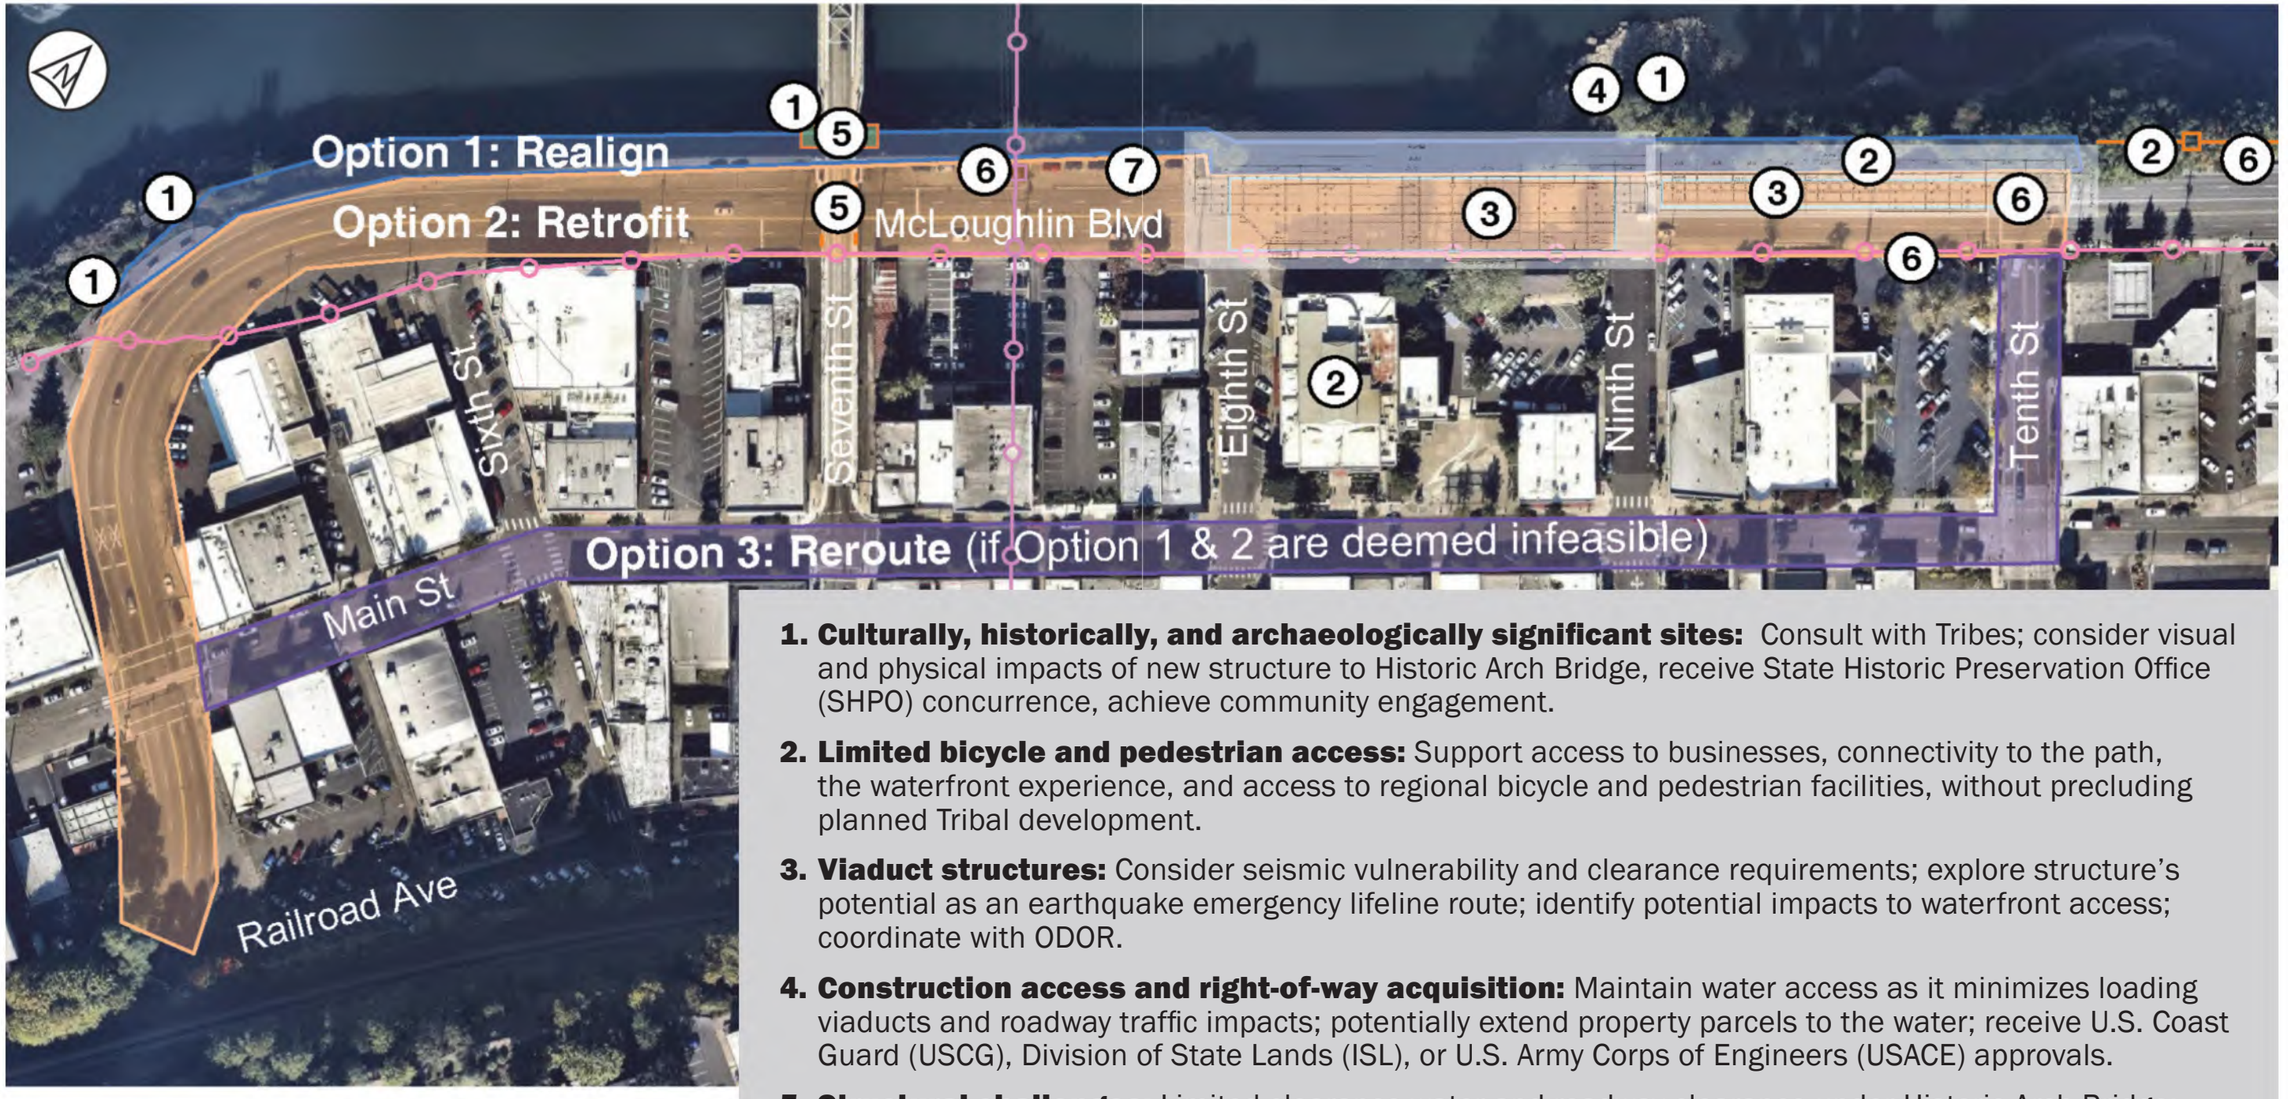
The City of Oregon City and the Oregon Department of Transportation (ODOT) have partnered to investigate alternatives for developing a shared-use path along this stretch of McLoughlin Boulevard. This shared-use path would complete the third and final phase of the McLoughlin Boulevard Enhancement Plan.

This shared-use path is intended to contribute to the sense of place and community identity while providing recreational access and closing a critical gap in the region's active transportation network for people walking, biking, and rolling. It will allow people to visit the future Willamette Falls Riverwalk and tumwata village without having to mix with traffic.

The Project also presents an opportunity to enhance the McLoughlin Boulevard streetscape to invite more activity along the waterfront, encourage travel to downtown Oregon City, and complement the shared-use path.

Making Connections

The McLoughlin Boulevard shared-use path will connect to and complement other development efforts on Oregon City's waterfront:



- **tumwata village** is the planned redevelopment of the 23-acre former Blue Heron Paper Mill site at Willamette Falls. The current plans for this property feature a **Willamette Falls Riverwalk**, trails, a public plaza, gathering space, habitat restoration, and redevelopment of industrial uses along the Oregon City waterfront. The proposed shared-use path would connect directly to this development and the riverwalk.
- The unadopted **Oregon City–West Linn Pedestrian–Bicycle Bridge Concept Plan** details potential alignments for a dedicated pedestrian–bicycle bridge across the Willamette River between Willamette Falls and the I-205 Abernethy Bridge.

Study Area

The study area focuses on McLoughlin Boulevard between 10th Street and Railroad Avenue in downtown Oregon City and a parallel route on Main Street between 10th Street and McLoughlin Boulevard. The study area is classified as Mixed-Use-Downtown, according to the Oregon City Comprehensive Plan land use designations. McLoughlin Boulevard runs northeast-southwest along the Willamette River, connecting Oregon City to Portland through Milwaukie and Gladstone to the north and Canby to the south. McLoughlin Boulevard connects to I-205, providing regional connections throughout Oregon. Figure 1 illustrates the study area, critical design considerations, and potential design alternatives.

Figure 1. Critical Elements and Potential Design Option Solution Sets

1. **Culturally, historically, and archaeologically significant sites:** Consult with Tribes; consider visual and physical impacts of new structure to Historic Arch Bridge, receive State Historic Preservation Office (SHPO) concurrence, achieve community engagement.
2. **Limited bicycle and pedestrian access:** Support access to businesses, connectivity to the path, the waterfront experience, and access to regional bicycle and pedestrian facilities, without precluding planned Tribal development.
3. **Viaduct structures:** Consider seismic vulnerability and clearance requirements; explore structure's potential as an earthquake emergency lifeline route; identify potential impacts to waterfront access; coordinate with ODOR.
4. **Construction access and right-of-way acquisition:** Maintain water access as it minimizes loading viaducts and roadway traffic impacts; potentially extend property parcels to the water; receive U.S. Coast Guard (USCG), Division of State Lands (ISL), or U.S. Army Corps of Engineers (USACE) approvals.
5. **Structural challenges:** Limited clearance water and roadway clearance under Historic Arch Bridge; varying water levels.
6. **Existing utilities, retaining walls, and signals:** Identify cost impacts of impacts to utilities, retaining walls, and signals.
7. **Existing parking:** Identify potential impacts to existing parking.

Previous Planning Efforts

Planning documents dated as early as 1999 have identified a desire for a shared-use path in this area. These plans highlight some key considerations for the Project.

- The **Oregon City Comprehensive Plan** includes land use and economic development policies that encourage higher density, walkable neighborhoods, infill development and redevelopment, and more mixed-use land use types within neighborhoods that would benefit from greater availability of active transportation facilities.
- The **Oregon City Transportation System Plan (TSP)** includes a project for a shared-use path (Project S3; page 87 of TSP Volume 2-2) on the segment of McLoughlin Boulevard within the study area and various bicycle improvements nearby (Projects B1, B2, B3, and B5; page 56 of TSP Volume 1). It also includes goals and policies related to envisioned modal priorities, which include improving the comfort and convenience of walking, biking, and transit options and ensuring that land development policies support these modes.
- The **McLoughlin Boulevard Enhancement Plan** provides initial recommendations for the cross-section of McLoughlin Boulevard from the railroad underpass to the Clackamas River Bridge, which includes a waterfront promenade.
- The **Oregon City Downtown Circulation Plan** and **Oregon City Downtown Community Plan** provide visions and recommendations for downtown Oregon City, including enhancements to McLoughlin Boulevard.
- The unadopted **Oregon City–West Linn Pedestrian–Bicycle Bridge Concept Plan** highlights alignments for a pedestrian–bicycle bridge and details a vision for pedestrian, bicycle, and transit connectivity to the Willamette Falls Downtown District.
- The **Willamette Falls Riverwalk Master Plan** outlines a long-term vision to guide development of the Willamette Falls Riverwalk, which includes a promenade, trails, public plaza, gathering space, habitat restoration, and redevelopment of industrial uses along the Oregon City waterfront. The shared-use path along the segment of McLoughlin Boulevard within the study area would be a key connector to the Willamette Falls Riverwalk.
- The **Visioning for Blue Heron** and **Redevelopment Plans** (tumwata village) detail concepts from the Confederated Tribes of Grand Ronde for an enhanced riverbank at the former Blue Heron site, which is directly west of the segment of McLoughlin Boulevard within the study area.
- **The Oregon City Downtown Transportation Demand Management (TDM) Plan** outlines strategies and policies to maximize traveler choices in and around downtown Oregon City.
- The **Oregon City Downtown Transportation Demand Management (TDM) Plan** outlines strategies and policies to maximize traveler choices in and around downtown Oregon City.

Chapter 2: Purpose, Need, and Vision

Corridor Vision

"The proposed Willamette Falls Path extension and streetscape enhancements contribute to the sense of place and community identity as an urban corridor and community gateway. The chosen design will promote safety through context-sensitive design that discourages speeding and improves the walking and biking experience along the corridor. The path provides a regional link accessible to users of all ages and abilities, filling a key active transportation gap and providing a continuous link to existing and planned open spaces along the Willamette and Clackamas Rivers, including the tumwata village development, and connections to other transportation links such as a future recreational/commuter river ferry and the Oregon City–West Linn pedestrian–bicycle bridge. The proposed path is representative of the local needs and priorities of the Oregon City community and has been developed as an implementable and fundable alternative."

Purpose and Need Statement

The purpose of the Project is to create a shared-use path and streetscape that enhances safety for all transportation modes and bridges the missing link for pedestrian and cyclists on McLoughlin Boulevard between 10th Street and Railroad Avenue through well-considered design. The Project should also be viewed as a crucial component of the larger community facility and a destination that connects users to various amenities and open spaces along the Willamette River.

Within the Project area, the following transportation needs have been identified in consultation with the City of Oregon City, ODOT, and the Project Development Team to guide the development of an active transportation solution:

- **There is a gap in safe, comfortable, and accessible facilities for people of all ages and abilities who are walking and biking on McLoughlin Boulevard.** The cross-section along McLoughlin Boulevard between 10th Street and the proposed tumwata village and riverwalk consists of curb-tight sidewalks and four vehicle lanes. This cross-section does not meet the current ODOT Highway Design Manual or City of Oregon City design standards and creates an imbalance between how the needs of non-motorized and motorized users are being addressed in the corridor. The Project location has been determined to result in a Level of Traffic Stress of 4.[1] People of most ages and abilities do not feel comfortable and/or able to walk, bike, or roll along this segment, creating a barrier in the regional active transportation link between Oregon City and Portland.
- **Oregon City's waterfront is currently disjointed and not seen as a contiguous amenity.** Locally, active transportation facilities along McLoughlin Boulevard are needed to provide connections to the planned tumwata village and riverwalk, historic downtown Oregon City, envisioned pedestrian and bicycle bridge, and recreation opportunities along the Willamette River. The Willamette River is a culturally significant site, and the Historic Arch Bridge is a historically significant structure. This active transportation connection will create additional opportunities for people to access, experience, and visually imagine the historic significance of the river, falls, and adjacent lands, while honoring the indigenous connections to the land and acknowledging traditional ways of movement along waterways.
- **The chosen design will support Oregon City's tourism, economic, and community development goals by improving walking and biking facilities to better integrate and reorient the downtown area's relationship with the Willamette River.** Active transportation facilities are shown to improve economic conditions by creating attractive and walkable business districts and providing access to various destinations, local businesses, and jobs.[2] Active transportation facilities contribute to redevelopment and other investments along the corridor. Vehicle congestion and parking limitations discourage travel in downtown Oregon City and are therefore a barrier to businesses and expanded economic development. Beyond the proposed McLoughlin Boulevard corridor, congestion leads to neighborhood spillback and cut-through traffic and detracts from the sense of place and community identity desired by residents, business and property owners, and visitors to Oregon City. The lack of complete walking and biking facilities, including the gap represented by the termination of the current Willamette Falls path, also discourages travel to downtown Oregon City as a regional destination. A complete connection for people walking, biking, and rolling along McLoughlin Boulevard and to historic downtown Oregon City, Oregon City Transit Center, and the municipal elevator is needed to encourage mode shift,[3] support transportation demand management efforts, minimize impacts to adjacent residential areas, and support the Oregon City 2040 Comprehensive Plan policies related to multimodal connectivity and transportation demand management.
- **Vehicular congestion impacts the historical, cultural, and environmental aspects of the site.** Vehicular congestion creates noise and emissions that detract from the historic, cultural, and environmental aspects of the site. A continuous shared-use path connection is needed to create an opportunity for transportation mode shifts consistent with the region's climate goals, and ensure that historical, cultural, and environmental resources are preserved for future generations. The physical design of the shared-use path needs to address the function of the facility in a way that minimizes or eliminates local environmental impacts and does not inflict harm on the river or nearby communities. Any work done in the study area needs to recognize the special role and voice of tribes in the Willamette Falls area of both land and water and emphasize tribal and community involvement in decision-making.

1. According to the City of Oregon City's Downtown Bicycle and Pedestrian Needs Inventory and Action Plan, the segment of OR99E between 12th Street and Railroad Avenue is at an LTS of 4. LTS 4 facilities are high stress routes and are only suitable for experienced and skilled cyclists or able-bodied adults with limited route choices.
2. Source: Portland State University. Metro Active Transportation Return on Investment Study. May 2022.
3. Mode shift is the opportunity to change how people move, particularly the shift from single occupancy vehicles (SOV) to sustainable modes of active transportation (i.e., walking, biking, rolling, or taking transit) to reduce greenhouse gas emissions and improve quality of life.

Establishing the Urban Context

The ODOT Highway Design Manual approach to context-sensitive design should be considered when planning and designing state roadways. Identifying the study area's urban context provides design guidance to inform roadway characteristics, roadway user types, and travel demand expectations. According to this guidance, the selected urban context is Urban Mix. However, based on existing land uses, planning documents, the community vision, desired outcomes for the Project, and the envisioned modal priorities for Oregon City, a Traditional Downtown/Central Business District (CBD) is recommended as the Highway Design Manual context that is most appropriate and best aligns with the community vision.

Traditional Downtown/CBD

A Traditional Downtown/CBD classification according to the ODOT Highway Design Manual includes mixed land uses, shallow building setbacks, and high building coverage. Roadways within this context should have lower vehicles speeds (25 miles per hour [mph] or less), wide and comfortable bicycle and pedestrian facilities, and appropriate landscaping and street trees. The priority users are people walking and biking.

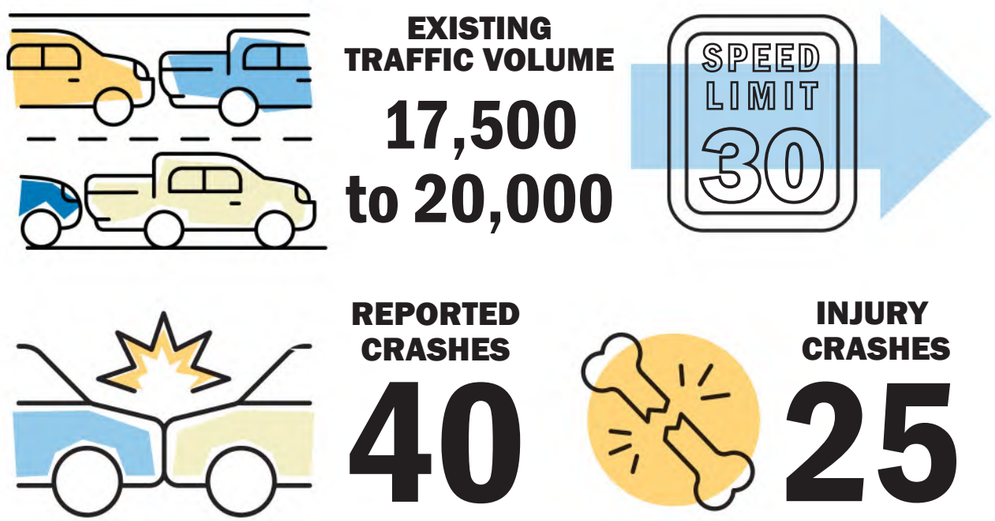
Source: Oregon Historical Society Library (OrgLot500_A_270)



Chapter 3: Existing Conditions

OR99E (McLoughlin Boulevard) is a state highway that runs between Junction City and Portland. Within the study area, McLoughlin Boulevard is a four-lane principal arterial with a posted speed limit of 30 miles per hour (mph). The intersections of 10th Street and Main Street are full signals, while 7th Street includes a pedestrian signal for crossing McLoughlin Boulevard to the Willamette River seawall. All other intersections in the study area are stop-controlled on the minor approach.

McLoughlin Boulevard carries between 17,500 and 20,000 bi-directional daily vehicles. Between 2018 and 2022, there were 40 reported crashes in the study area, with 25 being injury crashes. In this 5-year period, there was one pedestrian-involved crash and no reported fatal crashes.

The section of McLoughlin Boulevard between 10th Street and 8th Street is horizontally constrained by the existing viaduct structure and Historic Arch Bridge (see Figure 2). Neither facility is expected to be replaced with an expanded structure to support streetscape widening, which is necessary to provide the needed width for safe bicycle and pedestrian access.

Attaching a new path to the existing viaduct is also not feasible due to its age and structural design. As described in Chapter 5: Design Alternative Development, a road reorganization on McLoughlin Boulevard is not feasible due to high vehicular volumes. Therefore, an externally supported structure parallel to McLoughlin Boulevard is the only feasible solution for a shared-use path within the study area.

5 Year (2018 - 2022) Crash Statistics

Figure 2. Historic Arch Bridge (top) and Viaduct (bottom) Constraints

Source: Google Maps

Chapter 4: Public Involvement

Public involvement has been included throughout the Project process. Along with general outreach and advertisement, the project team has conducted an online open house and City-led outreach.

The first opportunity for the public to provide input on this plan began in December 2023 with an open house. The primary purpose of this initial outreach was to create awareness about the Project, its benefits, and potential burdens or impacts, as well as to solicit public input on the initial design alternatives.

After this open house, the project team reported that none of the designs presented were feasible due to the complexity of the area. The Oregon City Commission directed the project team to continue investigating an external long-span approach parallel to McLoughlin Boulevard with streetscape improvements. The City continued outreach with various groups and committees through 2024 to collect feedback on the preferred design.

Details on the public outreach program are summarized in the following sections.

Overarching Materials and Notifications

Tools used to convey Project information and publicize outreach opportunities include the following:

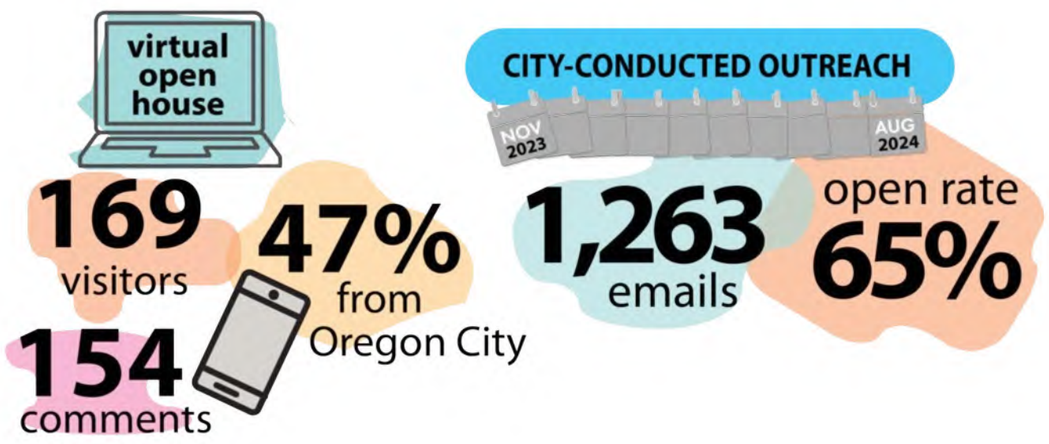
- **Web page:** A Project web page, hosted on the City's website was launched and updated regularly.
- **Community database and comment log:** Documented public comments, correspondence, and updates to Project mailing list.
- **Project fact sheet:** One-pagers provided updates and opportunities for engagement.
- **Direct mail:** Postcards notified neighboring residents about public engagement opportunities.
- **Social media:** Project announcements shared on the City's social media channels.
- **Advertising:** Digital advertisements used to promote the Project and public engagement opportunities.
- **Email:** Email newsletters provided Project information and engagement opportunities.

Figure 3. Online Open House

Interested Party Interviews and Briefings

The project team held three interviews with interested parties in early November 2023 to collect feedback on the corridor's issues and potential alignments. These interested parties represented transportation, education, and housing sectors in Clackamas County and Oregon City, and included The Street Trust, Oregon City School District, and Housing Authority of Clackamas County.

Online Open House



The Project's online open house was launched on the Project web page on December 6, 2023. The online platform provided informational stations to learn about the Project and provide feedback via the embedded survey, which closed on December 22, 2023. Users were invited to provide feedback on the proposed design alternatives and priorities for the McLoughlin Boulevard corridor (Figure 3). The web page also included a general comment form where users could submit other feedback regarding the Project.

Overall, the majority of community members preferred Alternative 1B: High Route, a design with a new pathway structure at street level next to McLoughlin Boulevard. Participants also preferred a pathway design that traversed through the Historic Arch Bridge columns.

City-Conducted Outreach

The City conducted targeted outreach to promote the open house and collect feedback during various phases of the Project. City staff attended outreach meetings and briefings with the Planning Commission; Transportation Advisory Committee, Parks and Recreation Advisory Committee, Citizen Involvement Committee, Clackamas County Pedestrian and Bikeway Advisory Committee. City staff also briefed the Oregon City Commission during six key decision points and Project milestones.

City staff leveraged several communication channels to share information about the Project. These channels include social media posts, a monthly "e-trail" news update in the City's Winter Trail News publication, and coordination for a December 2023 earned media article in Oregon City News.

Chapter 5: Design Alternative Development

Prior to exploring separate shared-use pathway structures paralleling McLoughlin Boulevard, the project team examined a No-Build Alternative and potential McLoughlin Boulevard Lane Reorganization Alternative.

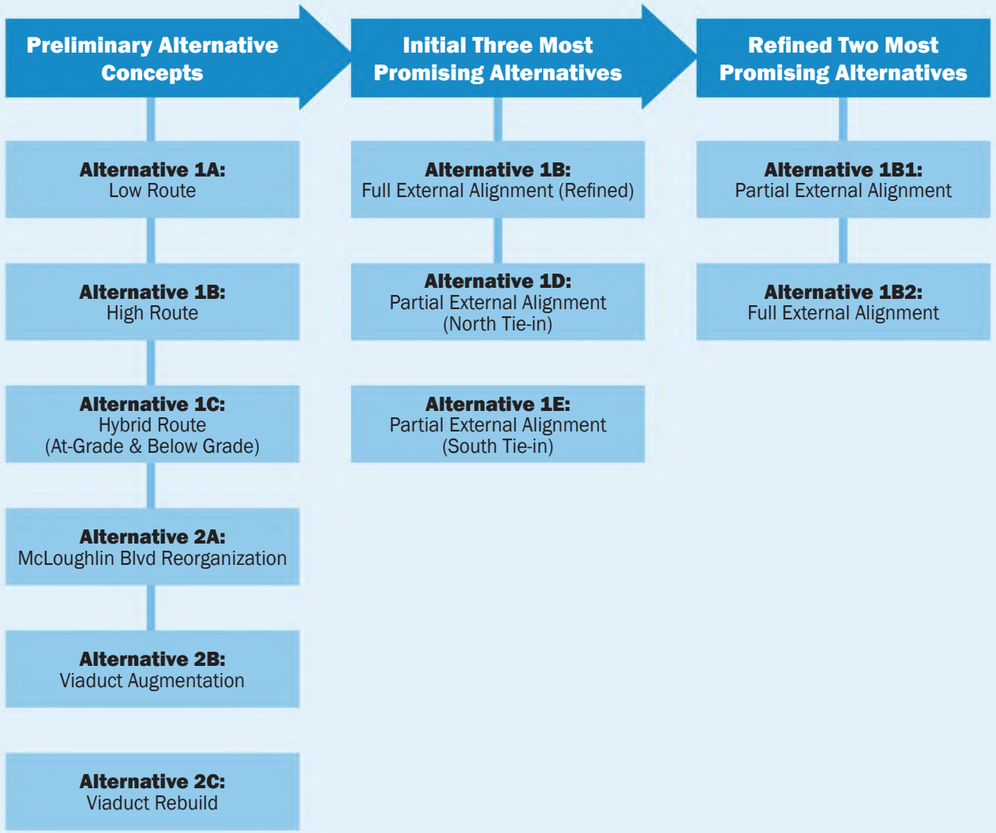
No-Build Alternative

As part of alternative development and evaluation, the project team also examined a reroute, or no-build, Main Street alternative. The No-Build alternative provides a parallel alignment through downtown Oregon City via 10th Street and Main Street, as shown in Figure 4.

Main Street has a right-of-way that is approximately 60 feet and includes two travel lanes, two parking lanes (totaling about 40 feet), and 10-foot sidewalks on each side abutting 0-foot building setbacks. There are currently curb extensions at most intersections and shared-lane markings, or "sharrows."

The project team explored and evaluated two primary options for improving bicycle access on Main Street as part of the No-Build Main Street alternative. Based on this evaluation, conversations with Oregon City staff, and a review of background documents, the team it was determined that the No-Build Main Street alternative does not adequately address the Project's Purpose and Need.

Figure 4. No-Build Main Street Alternative Alignment



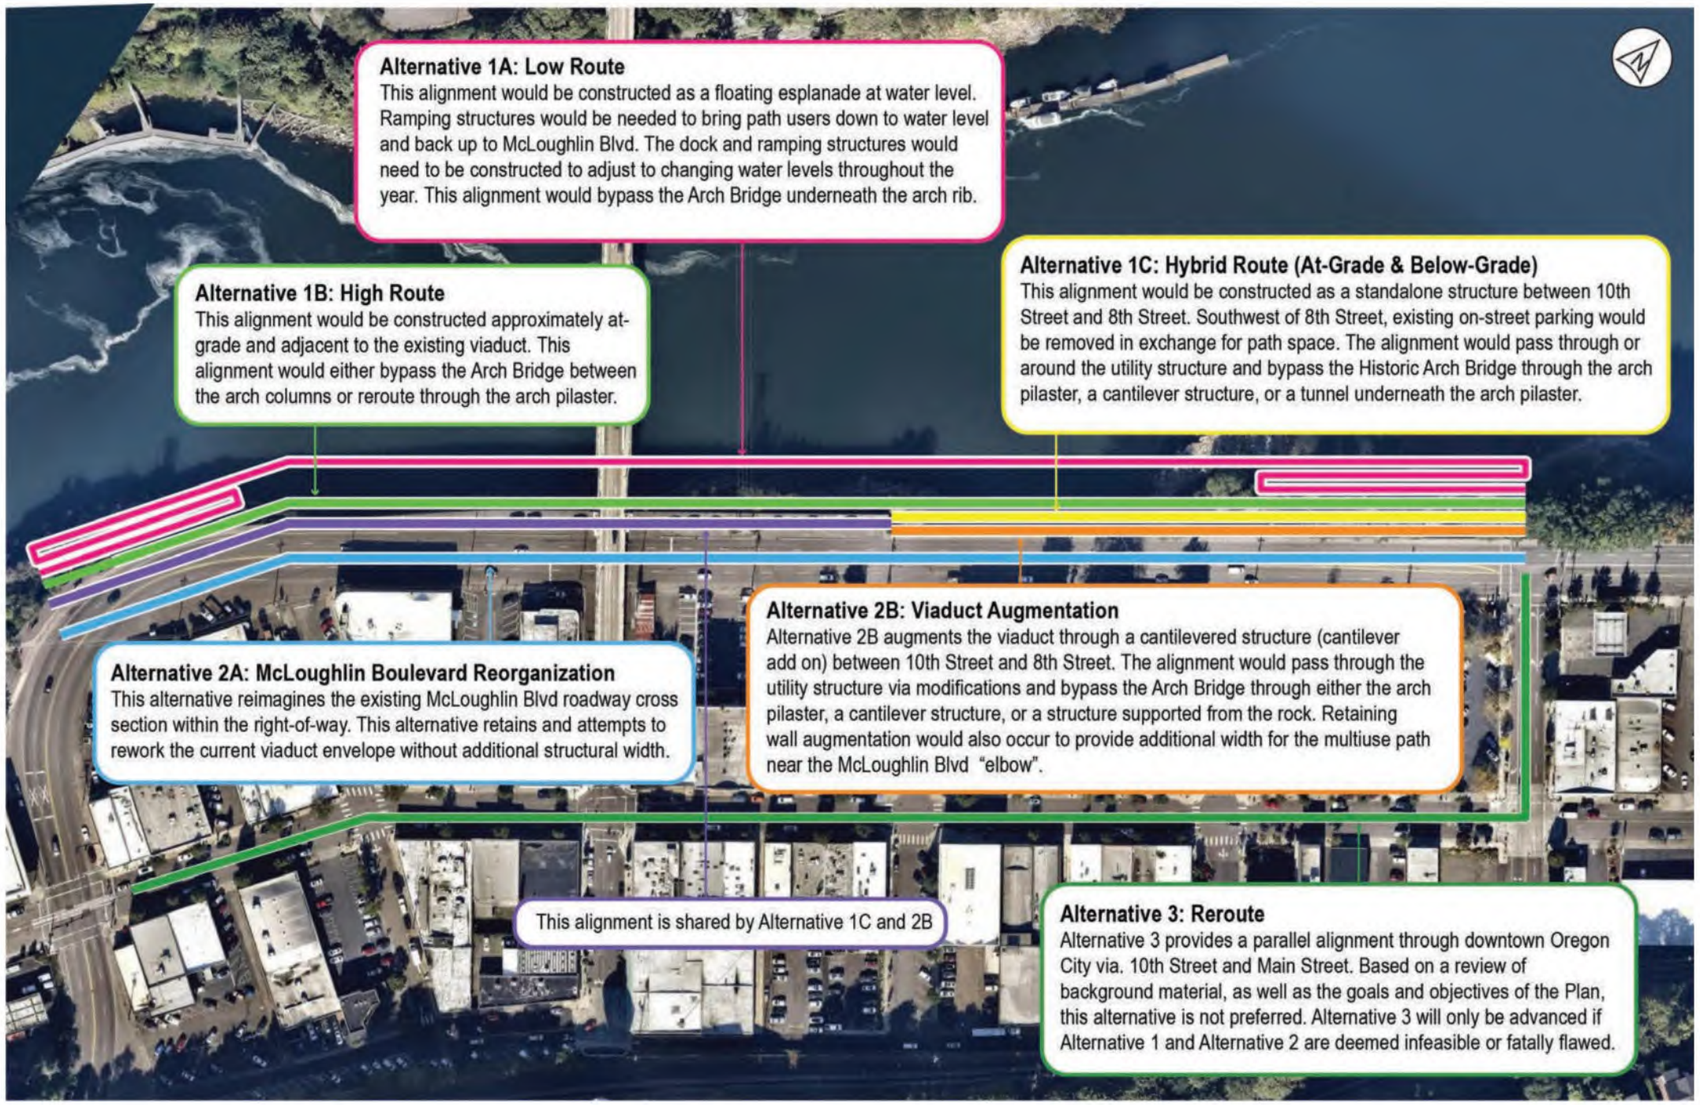
McLoughlin Boulevard Lane Reorganization Alternative

A potential road reorganization (removing one lane southbound or northbound) on McLoughlin Boulevard was considered to potentially create space for a shared-use path. Based on the ODOT Highway Design Manual "Estimating Capacity for Highways" methodology, a road reorganization would not be appropriate based on current or future projected traffic volumes. As such, a reorganization of McLoughlin Boulevard does not meet the Project's Purpose and Need.

McLoughlin Boulevard Parallel Structure Alternatives

After confirming that the No-Build and McLoughlin Boulevard Roadway Reorganization alternatives did not support the Purpose and Need, the project team developed several parallel structure alternatives to McLoughlin Boulevard. Figures 5A and 5B summarize and illustrate the primary alternatives and most promising refined alternatives.

Figure 5A. McLoughlin Boulevard Shared-Use Path Development Alternatives



Initially, the team developed six alternatives along with a No-Build (Main Street) alternative. Three of the alternatives included a stand-alone, separate structure, and three required structural support from the McLoughlin Boulevard viaduct and/or seawall. Based on coordination with ODOT and further structural analysis, the three viaduct alternatives were deemed infeasible. In addition, Alternative 1A (which ramped the structure down to water level) was deemed infeasible due to user comfort, water level fluctuation, and constructability concerns.

Initial Three Most Promising Alternatives

Based on this analysis, three initial most promising alternatives were then developed, all providing a stand-alone, separate structures parallel to McLoughlin Boulevard but with different tie-ins to the seawall near the Historic Arch Bridge. The project team evaluated these alternatives to determine their structural viability by considering aspects ranging from ground support to span options.

First, an analysis of possible foundation locations and geotechnical conditions was performed and indicated that there was little to no opportunity for external foundation support on the western portion of the alignment (south of the Historic Arch Bridge). There was a practical lack of available ground, steep vertical rock surfaces, and a steep ground drop-off at the base of the seawall extending below water, where depths extend up to 90 feet. Anticipated ground-support constructability challenges and risks associated with most of the 18 potential foundation locations would require complicated structural solutions that may have limited construction timing windows. Therefore, a structure that relies on consistent foundations would be difficult to construct and be high-risk in nature.

Figure 5B. - McLoughlin Boulevard Shared Use Path Alternatives

Structural requirements for the initial three alternatives were evaluated at a conceptual level to assess feasibility and the viability of structure type and materials. The project team first evaluated a conventional viaduct, consisting of conventional span-length structures as external viaduct elements providing physical separation between the existing viaduct and seawall. The analysis showed numerous risks to the existing seawall, adjacent utilities, and constructability of the foundation in front of or behind the seawall.

In addition, the project team evaluated a long-span cable-supported alternative, which provides a structure that requires only two foundation locations, leveraging the location of better ground conditions at either end of the alignment. The reduced number of foundations significantly reduced the risk, improved opportunities to avoid excavation issues, minimized in-water and permitting risks, and lowered chances of cultural or archaeological impacts.

Given the site constraints and challenges, the project team introduced two structural configurations (i.e., "partial external" and "full external") as feasible approaches to supporting the alignment. These refined two most promising alternatives are summarized below and conceptually illustrated in Figure 6 and Figure 7.

- **Alternative 1B1:** Partial External Alignment: Conventional beam elements on the northern portion and a long-span superstructure on the southern portion.
- **Alternative 1B2:** Full External Alignment: Long-span, cable-supported structure with two foundations.

Figure 6. Alternative 1B1: Partial External Alignment

Figure 7. Alternative 1B2: Full External Alignment

Refined Two Most Promising Alternatives

To identify a recommended alternative, the refined two most promising alternatives were further evaluated based on structural feasibility and constructability; geotechnical and archaeological constraints; and cultural and historical criteria. Alternative 1B1: Partial External Alignment raised several challenges, including:

- Creating the need for the maximum number of foundations, which could lead to construction and geotechnical challenges and risks.
- Needing to build foundations in variable topography, requiring wide-ranging specialty footings.
- Requiring temporary access bridge needs.
- Requiring traffic disruption to McLoughlin Boulevard during construction.
- Requiring hydraulic/in-water work.
- Raising potential conflicts with the existing structures and utilities.
- Exposing the Project to numerous subsurface conditions and unknowns.
- Increasing the potential for inadvertent archaeological discoveries.
- Competing visually with the Historic Arch Bridge with a two-arch design.
- Requiring two signature long spans.
- Requiring seismic weight and heights to be perched above foundations.
- Raising constructability concerns.

Due to these challenges, the partial external alignment was eliminated, and the Project Management Team selected **Alternative 1B2: Full External Alignment** as the recommended alternative. This long-span, cable-supported structure avoids deepwater footings and leverages more accessible footing space at either end of the most promising alignment, minimizing risk and increasing constructability of the Project.

Chapter 6: Recommended Shared-Use Path Alternative

A Fully External Alignment

Alternative 1B2: Full External Alignment (see Figure 8) is efficient and effective at connecting the extremities of the Project, staying clear of many challenges and constraints by providing the most direct alignment. This alternative threads through the eastside approach to the Historic Arch Bridge, supported by the most structurally and visually lightweight structure available. The following describes one potential layout and structure type that was used to evaluate the recommended alternative's feasibility. The type, size and location (TS&L) for the recommended alternative will be determined in a future phase of Project work.

As shown in an elevation view (Figure 9), this alignment could be supported by a long-span suspension bridge consisting of a cable-supported structure with its north foundation located north of 9th Street and the south foundation south of 6th Street. This structure, supporting the fully external alignment, could provide maximum clearance below the deck for utilities and river water levels, including the 100-year flood level. This structure would require cable support from above the deck superstructure, which is both a design feature and a benefit for river flood and debris clearance in addition to fewer ground-supported piers. The cable support also provides the ability for the structure to pass through the existing Historic Arch Bridge with minimal visual and construction-related impacts (see Figure 10)

Figure 9. The Long-Span Concept/Alternative, Elevation of Structure Type

The design of a long-span bridge would require a specialist engineer and contractor. Conceptually, support towers could be inclined, tapered steel sections encased in concrete. These would support the required geometry for the catenary mainlines, which support the deck along the alignment profile and provide the strength to resist structural loading on the towers into the foundations. This form has structural advantages in resisting the applied loads while also providing a symmetrical structural configuration in elevation along with improved alignment features (e.g., a viewing area).

A long-span, cable-supported suspension bridge's segments can be erected "in the dry," as shown in Figure 11 and 12. By utilizing a highline connected to the main towers, this type of structural solution may also reduce construction challenges. Avoiding in-water work eliminates impacts associated with the river, flooding, and other associated hydraulic considerations. Any required in-water work could be scheduled during low water levels or located out of ordinary high-water levels.

Figure 11. Highline Access Example, Columbia Skywalk

Figure 12. Columbia River Skywalk (Source: City of Trail, British Columbia, Canada)

Figure 13. Bulb-Out Viewing Area

Placemaking Opportunities

The full external alignment layout also provides opportunities for significant placemaking and views of both Willamette Falls and the Historic Arch Bridge from the south end. A bulb-out at this location, as shown in Figure 13, could be a landmark with appropriate design elements and enhance views.

Tower foundations to support the full external alignment could be developed with public and tribal input to include community features, such as lookouts. Foundations could also integrate platforms at the tower for fishing and improved waterfall viewing. Instead of minimizing their aesthetic impact, the towers can be designed to be prominent and visible from multiple locations beyond downtown Oregon City. Such designs may enhance tourism and increase economic development on the waterfront path, in tumwata village, and in downtown Oregon City.

Additional waterfront development of the existing seawall parking areas also is available with the recommended alternative. Parking can be transformed into open spaces with landscaping, benches, picnic tables, and bike parking. The parking area flanking the Historic Arch Bridge could also serve as a community space and programming opportunity for summer events or special occasions, such as art markets, concerts, and holiday celebrations. The park would allow people on the shared-use path and from McLoughlin Boulevard and Main Street to easily access and enjoy the space.

Design Elements for Continued Refinement

The recommended alternative will be refined in structural design and development during the TS&L phase. Continued design refinements are identified in Figure 14 and detailed below.

- **A - North approach** – Span configuration, materials selection, ground supports to provide alignment support over available ground and connection to the existing shared-use path.
- **B - North tower** – Geometric configuration that meets materials, structural, and aesthetic goals.
- **C - Underpass** – Span configuration, materials, and ground-support configuration to effectively bridge the gap from 8th Street to a viable tie-in location meeting geometric requirements and structural capabilities. In addition to evaluating geometry that meets acceptable horizontal alignments and vertical grades, design refinements include verifying clearance envelopes can be met, noting the availability for footings, and validating constructability below the viaduct and near major utilities.
- **D - Existing seawall** – Connectivity, materials, and methodology meeting geometric and structural requirements.
- **E - Existing Historic Arch Bridge** – Interaction/pass-through of the historic structure and the development of horizontal and vertical supports providing improved stability and support.
- **F - Deck section** – Development of materials and a system to meet geometrical and structural functionality that considers constructability, operations and maintenance aspects.
- **G - South tower** – Similar to the north tower with additional consideration for physical placement, configuration, and contextual integration of the footing and pylon at a key location.
- **H - South approach** – Configuration to improve waterfront views and pathway tie-ins while meeting structural and geometric requirements.
- **I - Contextual** – Development of the overall structure for local fit and form at the site while meeting programmatic objectives.

Figure 14. Full External Alignment Schematic Identifying Design Elements for Continued Refinement

Preliminary Cost Opinions

The recommended alternative would be supported by a structure designed to meet a minimum service life of 75 years and would incorporate materials durable enough for this anticipated service life. A service life longer than 75 years could be evaluated and addressed during the design phase and applied to an asset management plan, although there may be additional costs associated with materials capable of providing a longer service life.

Proposed materials would be selected for corrosion resistance to metals (i.e., aluminum, stainless steel, and zinc-coated elements) or to improve structural durability, such as reinforced, post-tensioned concrete decking and other materials, such as carbon fiber.

Planning-Level Maintenance

Maintenance would be influenced by how frequently the structure requires upkeep and the availability of stakeholder resources (e.g., City of Oregon City, ODOT) to provide maintenance. Annual costs for maintenance could range between $10,000 and $60,000, depending on the structure's age and upkeep levels.

An asset management program consisting of inspections to occasionally evaluate corrosion-resistant coatings on hangers, railings, mainlines, and deck elements would improve service life and ensure that deterioration does not affect safety. Inspection and maintenance of bearings and decking overlays would also be expected at regular intervals.

Planning-Level Cost Opinion

The project team prepared a range of planning-level cost estimates, shown in Table 1, which reflect the variability and influence of risk present at this early planning phase. The base construction cost opinion range is derived from material quantity and associated bid pricing based on a concept-level design configuration and similar project costs. The project team then applied adjustments for aspects ranging from supply chain availability to an assumed level of architectural input and additional allowances (i.e., contractor mobilization, traffic, and containment) to produce a concept-level construction cost estimate that ranges from $1,056 to $2,080 per square foot of deck area, or an estimated range of $25 million to $51 million.

The project team further developed these estimate ranges to also include assumed planning-level contingencies along with design engineering, construction, and project management. They included an allowance for a site-specific wind study to assess pedestrian comfort with a long-span structure to ensure that design refinements are aligned with the expectations of the long-span structure type. The cost range after these allowances were added was $41 million to $91 million.

Finally, escalation and design refinement cost allowances for a 2030 construction year were added, resulting in a cost range of $56 million to $123 million.

To mitigate the wide variability of these cost estimates, we strongly recommend that a Type, Size, and Location study (TS&L, 30% design level) be advanced to address the identified risk factors and reduce the range of potential project costs. The planning-level cost for a TS&L study is estimated to be $1.6 million.

Table 1. Alternative 1B2 Full External Alignment Planning-Level Cost Opinion

Base construction cost	Total estimate	$25–$51 million
	Per square foot	$1,056–$2,080
Base construction cost + planning-level contingencies	Total estimate	$41–$91 million
Total project cost, including escalation and design refinements	Total estimate	$56–$123 million

Key Considerations

The project team identified the following permitting, design, and constructability considerations associated with future development of the recommended shared-use path alternative.

Permitting and Design Considerations

Cultural and historical impacts: The configuration of bridge structure types may physically and aesthetically impact the historic Arch Bridge superstructure and associated foundations/footings. The project will likely have a Section 106 Adverse Effect on the Historic Arch Bridge, which is listed in the National Register of Historic Places.

- **Mitigation:** A Memorandum of Agreement will need to be completed to "resolve" the Adverse Effect with mitigation. The project will also need to address potential impacts to McLoughlin Boulevard, including the seawall and railing, parking areas, and other sensitive areas or structures. In later stages of design, context-sensitive design elements can be integrated into structural support configurations for the recommended alignment to minimize any cultural and historical impacts.

Archeological impacts: Archeological remains or artifacts may be encountered during site preparation or excavation efforts while constructing structure foundation/footing near the existing seawall and Arch Bridge. These remains, which need to be preserved and could impact any ground construction works at this site, have an undetermined value.

- **Mitigation:** Context-sensitive approaches that mitigate impacts to archeological artifacts, remains, and other undocumented subsurface unknowns are high priorities considered in the recommended alignment and help minimize design changes and delays that may result.

Design: Addressing key site challenges for the recommended alignment alternative would require a specialized, context-sensitive structural approach that conventional bridge solutions cannot fully meet. Whereas conventional approaches pose significant constructability risks at the site, a specialized bridge structure that supports the recommended alignment and addresses key site challenges can add technical challenges and construction risks.

- **Mitigation:** The design risks can be managed through appropriate design expertise and the application of long-span, cable-supported bridge construction expertise in conjunction with a site-specific wind and vibration study if this type of structure is selected through a subsequent TS&L process. A specialist engineer and contractor with sufficient expertise and construction know-how would be required for the structure type that is advanced further.

Foundations: A potential structural configuration to support the recommended alignment alternative proposes significantly fewer foundations, with two major foundations located at favorable locations of ground support availability to significantly minimize risks associated with subsurface unknowns. In addition to simplified locations for structural support foundations to mitigate subsurface conditions, the two major foundations can use footing designs that aim to mitigate subsurface unknowns and balance constructability risks.

- **Mitigation:** Geotechnical and hydraulic risks would be mitigated through expertise and recommendations for the site based on topography and subsurface investigations.

Materials: Structural support for the recommended alignment alternative selected through the TS&L process may require specialty materials for key structural elements such as towers, anchorages, cables, hangers, and deck sections.

- **Mitigation:** These support types require appropriate design and advanced planning to accommodate lead time and supply chain availability challenges.

Constructability Considerations

Historic Arch Bridge: The recommended alignment requires physical passage through the arch (between vertical columns, below the deck level). Verifying that the structure can pass through the available opening with adequate clearances under operational conditions would be required. Sequencing and methodologies to pass primary load-carrying support elements through the arch would need to be carefully designed and planned to accommodate the associated technical risks to both the existing and proposed structures.

- **Mitigation:** These aspects may be managed through design and construction expertise with specialty cable-supported bridge types.

Deck stability: The stability and operational performance of the deck under wind and user-created vibrations during construction and while in service will require mitigating measures.

- **Mitigation:** Stability can be managed through design, construction expertise, and a site-specific wind and vibration study conducted simultaneously with design development.

Traffic disruption: The construction and placement of a structure parallel to McLoughlin Boulevard would require roadway-based access directly influenced by the structure type and configuration.

- **Mitigation:** One structural configuration considered (and subject to verification in the TS&L phase) that would support the recommended alignment alternative provides an opportunity to minimize construction concerns and reduce traffic disruption to McLoughlin Boulevard by leveraging the benefits of a long-span cable-supported bridge approach. This bridge structure-type configuration leverages inherent efficiencies for the delivery and installation of prefabricated decking elements that are erected above the water ("in the dry") to avoid in-river works, temporary supports, or access trestles. Additionally, a fitting long-span structure-type solution (validated through the TS&L phase) could utilize a highline connected to the main towers that adds efficiencies and opportunities to reduce construction challenges associated with working in or near a river with variable water levels and streamflow velocities. For instance, the delivery of prefabricated deck segments to key starting point locations to be moved into final locations on a cable-supported superstructure without temporary supports or in-water work improves the construction process and minimizes traffic disruption on McLoughlin Boulevard. However, construction of the shared-use path may still require some closures of McLoughlin Boulevard at key locations for the delivery and access of construction materials. Key aspects of constructability will be influenced by the structure type and evaluated in the TS&L phase.

Hydraulic impacts: Significant constructability risk is associated with any construction-based activities located near the Willamette River with streamflow and significant water level variations.

- **Mitigation:** Minimizing in-water construction work mitigates hydraulic risks and can eliminate impacts directly associated with the river (i.e., flooding, scour, and permitting), which impact design, budget, and schedule. Construction of the primary foundations for the recommended alignment is intended to minimize in-water work and provides the opportunity to schedule the activities during low water levels. Further, full containment during construction should be provided to prevent materials falling into the river.

Utilities: Overhead catenary cables present geometric and coordination challenges that need to be addressed during design and planning to mitigate risks and determine setback distances.

- **Mitigation:** The inherent structural and geometric form of the proposed configuration provides improved physical setback and buffer distances from utilities to avoid conflicts with overhead utility catenaries and provide safe separations, in addition to supporting utility operation and maintenance activities.

Integration: The southeast landing of the shared-use path will require integration with the tumwata village and riverwalk, which has not yet been fully designed.

- **Mitigation:** Opportunities to integrate structural design aspects of the recommended alignment alternative with adjacent project efforts may identify structural efficiencies not evident in the current project footprint and boundary conditions (i.e., anchorages, towers, and observation and viewpoint locations/interactions).

Chapter 7: Streetscape Enhancements

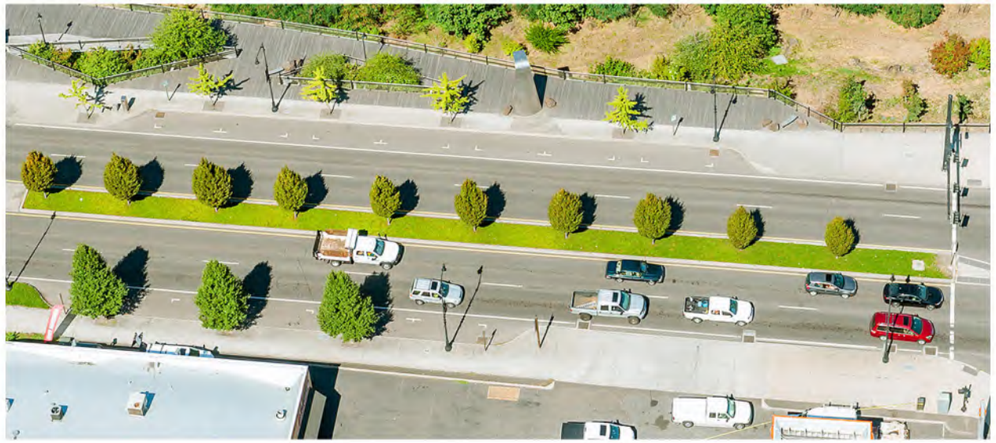
There is an opportunity to enhance the streetscape along McLoughlin Boulevard to complement the recommended shared-use path alternative, calm vehicular speeds along McLoughlin Boulevard, and better integrate downtown Oregon City with the waterfront. Sidewalk, landscaping, and placemaking improvements can be incorporated to calm traffic and create a sense of place, consistent with the Traditional Downtown/CBD urban context. If the streetscape enhancements are implemented separate from the shared-use path, additional design and phasing considerations will be needed.

The **McLoughlin Boulevard Enhancement Plan**, completed in 2005, recommends streetscape improvements, including wider sidewalks, landscaped medians, and improved signalized intersections and pedestrian crossings between the Clackamas River Bridge and Railroad Avenue

The City has successfully completed the first two phases of the McLoughlin Boulevard Enhancement Plan, including a shared-use path on the river side of the roadway. The segment from 10th Street north to Dunes Drive, completed in 2009 (Phase 1), includes wide sidewalks with tree-lined buffers on the south side of the roadway, landscaped medians with trees where space is available, and additional pedestrian crossing opportunities and signalized intersections.

The McLoughlin Boulevard Enhancement Plan recommends continued treatments and similar streetscape elements for the study segment of McLoughlin Boulevard between 10th Street and Main Street, including:

- Narrowing travel lane widths consistent with the ODOT Highway Design Manual to calm traffic and increase opportunities for additional modal considerations.
- Installing a median from 8th to 10th Streets.
- Incorporating and increasing the presence of landscaping and vegetation where possible.
- Providing wide sidewalks along the east side of the roadway. The recommended sidewalk width is 10 feet or greater; the minimum sidewalk width is 8 feet.
- Adding bicycle wayfinding signage.
- Retaining and enhancing the existing pedestrian-activated traffic signal at 7th Street.



To achieve the corridor vision and desired streetscape enhancements, the project team recommended two primary streetscape enhancement opportunities for consideration:

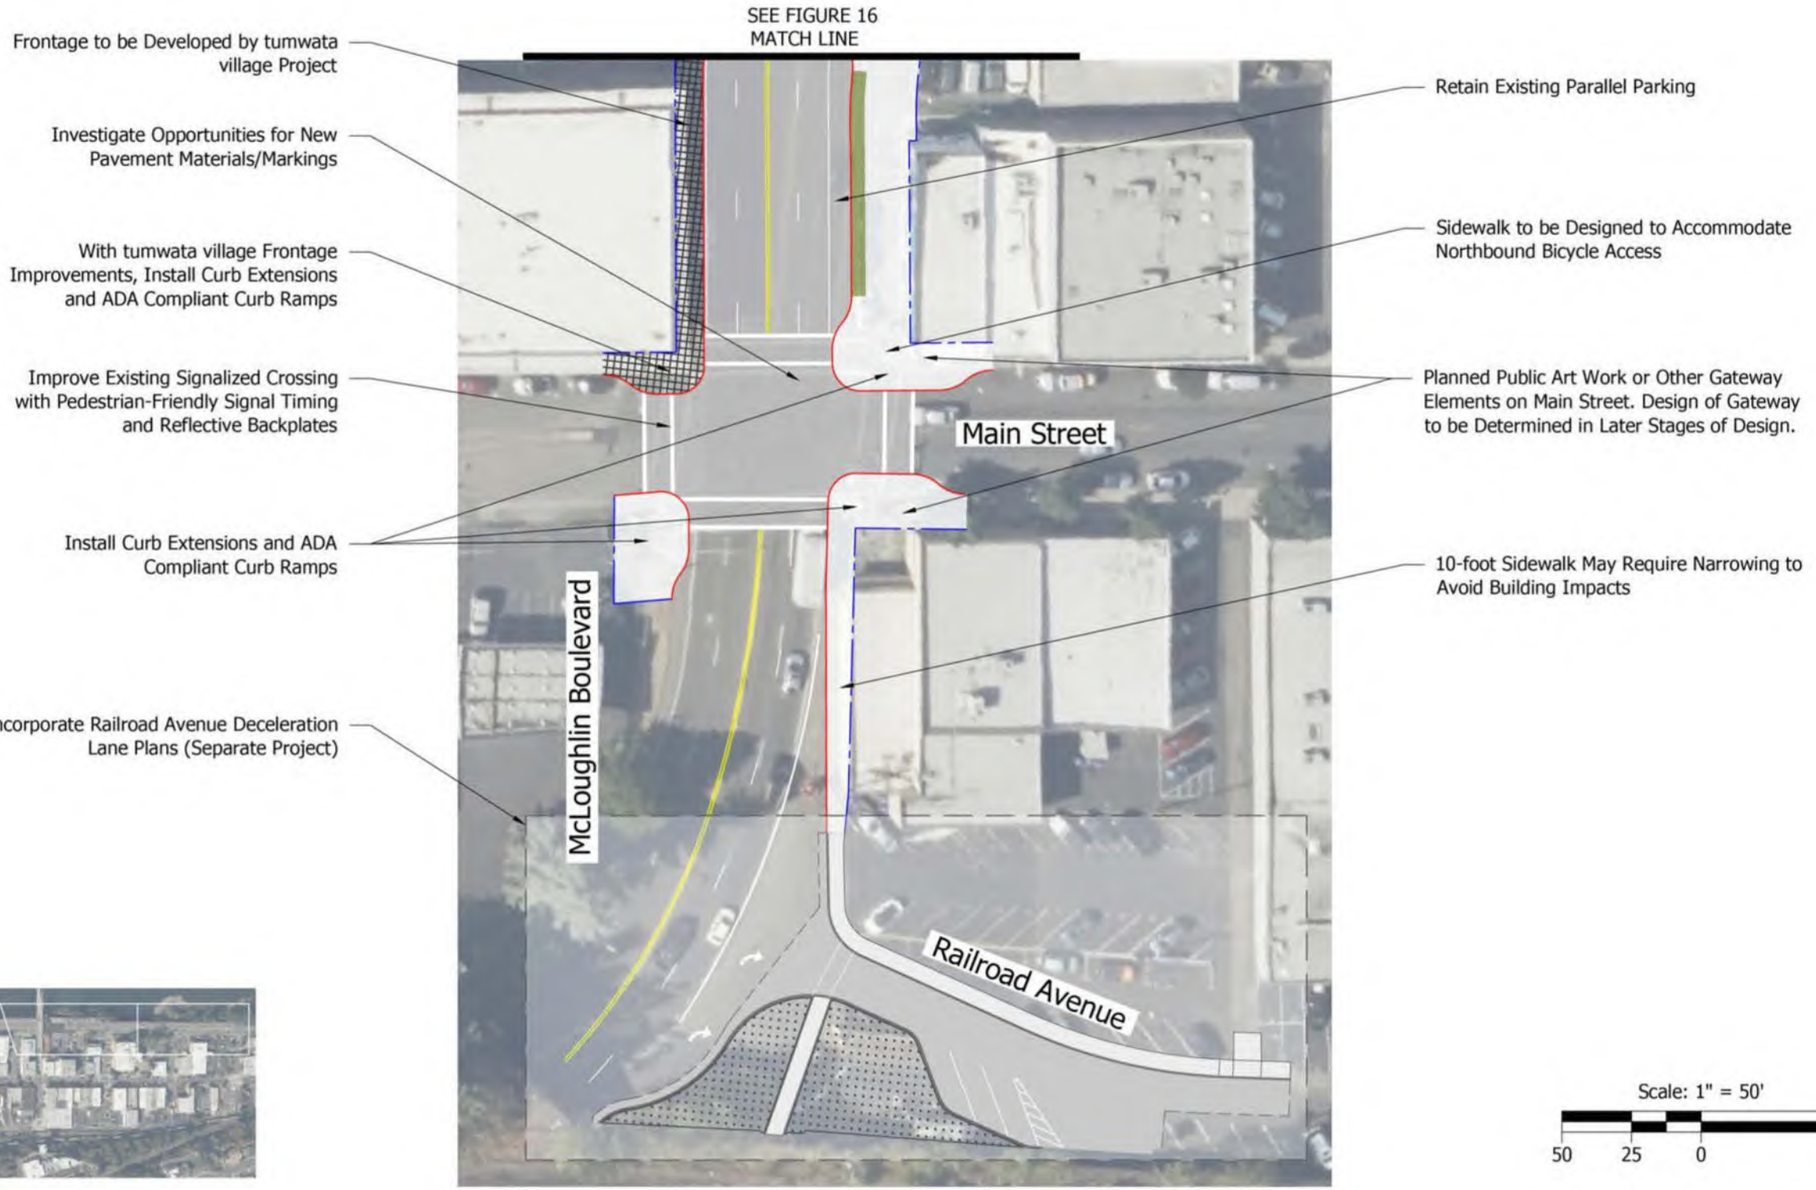
1. Reconfigure the roadway to provide additional space for sidewalk and landscaping improvements while increasing consistency with ODOT Highway Design Manual recommendations for the travelway realm—the area between the curb lines reserved for automobile traffic—based on the Traditional Downtown/CBD urban context.
2. Provide open spaces in the areas currently used for on-street parking along the river, under the Historic Arch Bridge, and along the curve area of McLoughlin Boulevard.

Recommended Streetscape Enhancement Concept

The recommended streetscape enhancement concept for McLoughlin Boulevard between 10th Street and Main Street is shown in Figure 15 through Figure 20.

Per ODOT HDM guidance, the cross-sections generally include 11-foot travel lanes with a 2-foot shy from the guard rail (river side) and a 1-foot shy from curbs.[1] The provided sidewalk is 10 feet with a 4.5-foot buffer zone and 0.5-foot curb zone. Where space is limited on the viaduct, this width is reduced. Additional shy distance is also provided to meet pinch points per Oregon Revised Statue (ORS) 366.215.

McLoughlin Boulevard Forestry and Habitat Considerations



The riverside of McLoughlin Boulevard is home to a riparian forest and ecosystem habitat. The consideration of forest and habitat impacts is vital and will be explored as part of future environmental assessments required under the National Environmental Policy Act (NEPA) federal law. The future design will integrate the shared-use path to the surrounding context while providing increased access to open space.

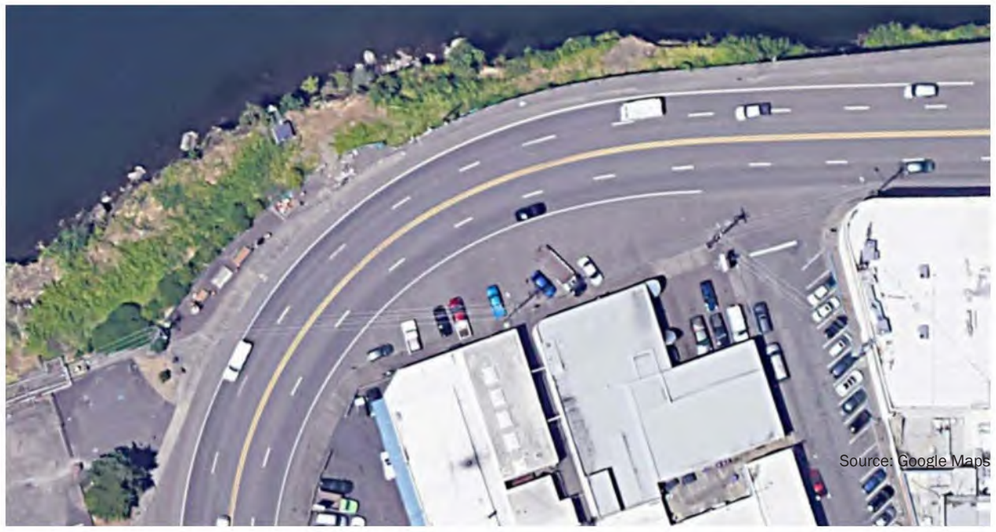
Design Considerations

The following section describes design considerations that the project team has incorporated into the concept layout for McLoughlin Boulevard.

McLoughlin Boulevard "Elbow"

Currently, the area in the McLoughlin Boulevard "elbow"—the curve northeast of Main Street—is used by a private business for parking and access. The existing sidewalk runs in front of the building but has frequent curb cuts due to several garages from the private business. This configuration raises several safety challenges, especially if the sidewalk is widened per ODOT Highway Design Manual guidance to 8 feet with a 2-foot frontage zone and a 5-foot buffer zone. Drivers backing vehicles out of the driveways/garages may not have enough room or sight distance to maneuver and may back into the curve portion of McLoughlin Boulevard. Retaining all the accesses as-is maintains the many conflict points between people walking and vehicles entering and exiting the garages. The existing configuration is shown in Figure 21. The project team developed two alternatives to address safety concerns in this area, described below.



Option A: Retain Accesses

In the first option, an 8-foot sidewalk and 5-foot buffer would be provided along the fog line, continuous with the sidewalks on either side of this section. No frontage zone is provided, as the sidewalk will not be in front of a building. Two driveways are provided to allow access to the existing garages and alley. Additional analysis would be needed in later design stages to determine how to configure driveway accesses to allow for safe maneuvering in and out of the garages. All other accesses to the property (two on McLoughlin Boulevard and one on 6th Street) would remain as shown in Figure 16 (Option A).

Option B: Open Space

Alternatively, with future redevelopment of the existing building, the garage and alley accesses could be closed to provide an open space in the "elbow." This open space would include a continuous sidewalk and buffer, but would also have space for additional landscaping, seating, street furniture, or public artwork. This option would eliminate any vehicles making turns at this portion of the curve and vehicular conflicts with people walking. The additional two driveway accesses on McLoughlin Boulevard could remain, if desired, but the access on 6th Street should be closed. Note that this is a long-term option and requires redevelopment of the property as shown in Figure 17 (Option B).

Figure 21. Existing "Elbow" Configuration

Source: Google Maps

Design and Implementation Phasing

The implementations of the streetscape enhancements and shared-use path are unlikely to occur in tandem. As a result, elements of the streetscape enhancement project may need to wait for shared-use path implementation to occur, particularly the section of McLoughlin Boulevard along the viaduct between 8th and 10th Streets. Removing the riverside sidewalk on the viaduct without providing pedestrian access via the shared-use path is not a viable option. Streetscape enhancements between 8th and 10th Streets are dependent on the implementation of the shared-use path.

Open Space

There is a parking area on the river side of McLoughlin Boulevard between 6th and 8th Streets with about 20 spaces. Just south of this parking area, there are six additional parking spots under the Historic Arch Bridge, accessed by two alleys. These alleys create curb cuts on McLoughlin Boulevard, which reduce the space available for Americans with Disabilities Act (ADA)-compliant curb ramps and a continuous pedestrian route. The project team developed two alternative options to integrate the streetscape enhancements with the parking areas while ensuring the inclusion of ADA-compliant facilities.

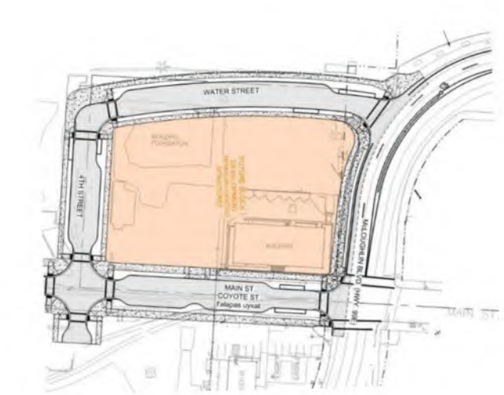
Option A: Retain Parking

In the first option, the parking to the north can be retained, but converted to tuck-in parking to provide more room for open space. The McLoughlin Boulevard crossing would remain as-is at the center of 7th Street, and a connection to the shared-use path would be provided just east of the Historic Arch Bridge column. For the south parking area, alley accesses are recommended to be reconfigured into driveways to provide a more continuous sidewalk. However, due to the need for a curb ramp for the 7th Street crossing, the additional driveways will lead to a "roller coaster" effect, in which sidewalk grading travels downward for curb ramps and driveways. The tuck-in parking includes 9' wide stalls and a 2' shy distance. A sidewalk would be provided under the Historic Arch Bridge, similar to the existing conditions as shown in Figure 18 (Option A).

Option B: Open Space

There is also an opportunity to create an open space in the northern existing parking area with additional landscaping and placemaking opportunities to provide a strong pedestrian and bicycle connection from the shared-use path to Main Street as shown in Figure 19 (Option B). This open space could connect to the recommended shared-use path with a short transition zone just east of the Historic Arch Bridge. The open space could provide a walking path, viewpoints of the shared-use path and river, and opportunities for seating and other street furniture.

In addition, closing the parking spaces underneath the Historic Arch Bridge would allow the two driveway access points to close, providing a continuous sidewalk for people walking along on the south side of McLoughlin Boulevard with no conflicts with vehicles. This arrangement also allows the 7th Street crosswalk to be shifted to the east, providing continuous bicycle and pedestrian travel on the shared-use path, through the open space, across McLoughlin Boulevard, and down the eastern alley to Main Street. This would provide a much-needed active transportation connection between the shared-use path and downtown. Further, the alley could be activated with landscaping, art, lighting, and/or street furniture.



Including these described open spaces would require the removal of approximately 26 on-street parking spaces and necessitates further analysis. Note that the open space adjacent to the shared-use path would be designed around the Historic Arch Bridge column and the existing utility structure, which are both placed within the existing parking area. Furthermore, the sidewalk under the Historic Arch Bridge is retained.

tumwata village

The western frontage of McLoughlin Boulevard north of Main Street will be developed by the tumwata village project. This process is ongoing, and the McLoughlin Boulevard Shared-Use Path project team is coordinating with the tumwata village project team.

The tumwata village team is also developing a project for an improved Water Street connection to McLoughlin Boulevard. While the design is still in progress, any future changes to Water Street should be incorporated with the proposed improvements to McLoughlin Boulevard. Figure 22 provides a schematic of the preliminary proposed improvements.

Figure 22. Water Street Improvements (Preliminary)

McLoughlin Boulevard Crossings

There are three existing signalized crossings along McLoughlin Boulevard in the study area:

- McLoughlin Boulevard/10th Street – Signal
- McLoughlin Boulevard/7th Street – Pedestrian signal
- McLoughlin Boulevard/Main Street – Signal

These signals will be retained. For all signalized crossings, reflective backplates should be considered where not provided, as well as adequate pedestrian-friendly signal timing strategies (such as leading pedestrian intervals).

At 10th Street, the eastern crosswalk should be aligned to the previous shared-use path, while the western crosswalk should be removed as there is no proposed riverside sidewalk on this portion of the roadway.

For Option A at 7th Street, the crosswalk will tie into the proposed open space to the north and the improved sidewalk to the south. No changes are proposed to the crossing, except for ensuring ADA-compliant sidewalks and curb ramps. Note that the 2005 McLoughlin Boulevard Enhancements Plan recommended a raised, textured concrete crosswalk with a special scoring pattern to match the sidewalks at this location.

For Option B at 7th Street, the project team recommends moving the crosswalk to the east to align with the proposed shared-use path connection just east of the Historic Arch Bridge. A continuous sidewalk on the south side will allow for ADA-compliant curb ramps and a pedestrian and bicycle path down the alley. This adjustment should consider signal equipment location and potential relocation in later design stages.

Finally, at Main Street, crosswalks will tie into improved sidewalks on the east side of McLoughlin Boulevard and to the tumwata village frontage. All curb ramps should be updated to be ADA-compliant, and curb extensions should be provided where there is room (i.e., in parking lanes). In addition, the design should incorporate future planned public artwork or other gateway elements on Main Street. The design of this gateway will be determined in later design stages.

Opportunity for New Crossing

The public, City, and other interested parties have expressed a strong desire for a grade-separated pedestrian and bicycle crossing of McLoughlin Boulevard within the study area. This connection would increase connectivity from downtown Oregon City to the riverfront and could provide access to a future Frog Ferry dock and other recreational amenities on the river.

The project team explored a variety of concepts, including an undercrossing in the vicinity of the existing 8th Street stairwell under the McLoughlin viaduct and an overcrossing utilizing the existing alleys adjacent to the Historic Arch Bridge.

Overcrossing Concept

The bridge deck of the Historic Arch Bridge is approximately 20–24 feet above McLoughlin Boulevard. In order to construct an overcrossing that rises up and crosses over McLoughlin Boulevard while staying under the 5% grade limit for ADA compliance, a ramp structure exceeding 400 feet in length is required. As a result, the overcrossing concept was dismissed based on physical constraints immediately adjacent to the Historic Arch Bridge and the likelihood of a Section 106 impact.

Undercrossing Concept

The project team also explored an undercrossing concept that utilizes the existing 8th Street stairwell under the McLoughlin viaduct. The 8th Street undercrossing concept is not precluded by the recommended alternative (Alternative 1B2: Full External Alignment) nor the streetscape improvements along McLoughlin Boulevard. The 8th Street undercrossing requires further refinement to determine cost and feasibility. Figure 23 illustrates a conceptual rendering of the 8th Street undercrossing.

Curb Extensions

Curb extensions shorten pedestrian crossing distances, reduce vehicular turning radii, and provide more space for landscaping or other placemaking elements. The project team recommends curb extensions at 6th Street, 8th Street, 9th Street, and Main Street. Note that only McLoughlin Boulevard is a truck route in the study area.

Figure 23. Conceptual Rendering of 8th Street Undercrossing

Chapter 8: Implementation

Implementation procedures for the shared-use path and McLoughlin Boulevard streetscape enhancements will vary. The shared-use path and McLoughlin Boulevard enhancements will likely not be implemented together, requiring additional design and phasing considerations as the projects move forward. The City of Oregon City is primarily responsible for the shared-use path and the McLoughlin Boulevard streetscape enhancements. ODOT is the permitting agency for these improvements and will collaborate on the project efforts as they move forward along with other partners, as shown in Table 2.

Table 2. Responsible Agencies for the Shared-Use Path and McLoughlin Boulevard Streetscape Enhancements

	City of Oregon City	ODOT
Shared-use path	• Design, construction, and maintenance of path • Complete environmental review in conjunction with the Federal Highway Administration	• Coordination on environmental review • Permitting agency responsibilities on design and construction • Coordination on viaduct maintenance
McLoughlin Boulevard enhancements	• Design, construction, and maintenance of most elements • Maintenance of new trees and medians • Maintenance of new open spaces	

In addition, the shared-use path, as a standalone, bridge-like structure, will require a more extensive environmental review and design phase. By adopting this conceptual plan, the Commission is providing direction to continue the conversation.

Riparian Shoreline and Habitat Considerations

This section of the Willamette River is characterized by a rocky shoreline with patches of riparian vegetation. It features mature trees such as bigleaf maple as well as various shrub varieties along the shoreline, providing habitat for supporting species. It is important to prioritize the preservation of trees over mitigation as the design is developed around the location of bridge foundations and structures. Make use of the bridge's habitat features to support nesting bats, birds, and other animals. The final design should also consider supporting existing and planned angler access when possible.

Shared-Use Path Implementation Plan

The implementation process for the shared-use path is as follows:

1. **TSP adoption:** Adopt the recommended shared-use path into the Oregon City TSP.
   - **a.** Through this action, the community would:
     - **i.** Reconfirm the need for a shared-use path connection on McLoughlin Boulevard between 10th Street and tumwata village.
     - **ii.** Recognize the complex and integrated benefits, burdens, and unknowns at this time.
     - **iii.** Define the alignment design.
     - **i.** Demonstrate the public support necessary to seek and secure funding to conduct the design and construct the new shared-use path connection.
2. **Partner agency coordination and interim actions:** Prior to identifying funding, the partner agencies led by Oregon City would:
   - **a.** Identify any specific upfront agency commitments.
   - **b.** Emphasize ongoing coordination with associated government entities.
   - **c.** Confirm ultimate shared-use path ownership, capital funding responsibilities, and maintenance responsibilities.
3. **Funding:** Seek funding for the environmental review and permitting process, design, and construction phases of the Project.
   - **a.** For some competitive grants, a project team may choose to advance a TS&L or higher design development to improve opportunities to secure construction funding. In these cases, the construction funding could be secured after the TS&L, described in Step 5.
4. **Environmental review:** The federal nexus resulting from either funding or permits from a federal agency will require a National Environmental Policy Act (NEPA) review to be complete. Partner agencies could initiate coordination with the lead federal action agency to complete NEPA-level scoping and technical resource impact evaluations as the project moves forward. Final NEPA clearance, in addition to Environmental Site Assessments consultation, related permits, and Section 4(f) analysis (if FHWA is the federal nexus) can be completed at the conclusion of the impact evaluation.
5. **Design:** Improved development for the definition of the type and configuration of a proposed structure supporting the recommended alignment alternative is necessary to confirm and validate conceptual designs, provide content and clarity for grant applications, and improve programmatic construction cost estimates.

The project will need to address Section 4(f) impacts on historic resources and publicly owned parks, recreation areas, or wildlife and waterfowl refuges if federal transportation dollars are part of the project's funding. Specifically, documentation would be centered primarily on the Oregon City Arch Bridge. The analysis would address whether the setting impacts of the shared-use path structure would adversely affect the activities, features, or attributes of the Oregon City Arch Bridge. Namely, the analysis would determine whether views of the Historic Arch Bridge or views of the Willamette Falls would be significantly obstructed by the structure. Due to the required effort, if this project was awarded federal funding, at least a year would need to be added to the project development timeline.

a. Project development phase (design acceptance phase, or DAP) including bridge TS&L phase deliverables:

i. Provides information required by FHWA for review and approvals and improves grant funding competitiveness.

ii. Provides preliminary hydraulic, geotechnical, and environmental recommendations.

iii. Documents the structure type alternatives studied and advanced.

iv. Rationalizes the geometry and identifies the primary structure type and configuration.

v. Improves construction costing estimates and addresses risks identified in earlier planning phases.

b. Project final plans, specifications, and estimate (PS&E) phase deliverables:

i. Provides construction documents and aligns the Project for construction implementation.

ii. Provides final hydraulic, geotechnical, and environmental recommendations.

c. PS&E to award (construction):

i. Bid documentation is provided to qualified contractors to bid for the Project and construct the design.

6. **Construction:** Using PS&E materials, advertise the construction contract for competitive bids. Once the contracting mechanism is determined (e.g., traditional design-bid-build or an alternative delivery method), the Project will be advertised for construction bidding and constructed. If an alternative delivery method is selected, Steps 5 and 6 may be combined.

Shared-Use Path Implementation Plan Environmental Review and Design

Completing an environmental review and design of the shared-use path will require the advancement of conceptual-level designs assumed in the feasibility and preliminary conceptual design phase to validate the designs and help narrow down practical solutions that achieve Project goals. A wide range of expertise will be necessary to develop the conceptual configuration and validate initial assumptions. The following list summarizes the expertise considered key to advancing the conceptual structural aspects:

- **Structural engineering design**— Development of assumed concepts identified in Phase 1A and reflect the results, findings, and recommendations from other expertise as documentation and data provides.
- **Geotechnical engineering**— Advancement of concept-level approaches and assumptions considered for the foundations/footings.
- **Hydraulic engineering**— Determination of river-based implications on the design, planning, and construction of the proposed structural configuration. This also includes the design of a stormwater conveyance and treatment system.
- **Wind and vibration engineering**— Identification of site-specific and structure-specific mitigation measures following an initial desktop study in the early stages of design development, leading to more refined and detailed efforts as design is progressed.
- **Durability/life cycle engineering**— Site-specific considerations for appropriate corrosion prevention and service life expectations to be met while considering operation and maintenance aspects of the proposed structure.
- **Specialty construction cost estimating**— Structure-specific costing that considers historical and anticipated costs associated with a specialty structure type that can support the recommended alignment in the planning phase and is subsequently verified in the TS&L phase (i.e., a long-span cable-supported bridge).
- **Specialty construction and risk management**— Structure-specific construction expertise to identify, assess, and proposed mitigation for technical risks.
- **Community/cultural/aesthetic**— Development and degree of integration of community goals for the structure in meeting the local site-specific context aesthetics and appeal.

McLoughlin Boulevard Streetscape Enhancements Implementation Plan

The implementation process for the McLoughlin Boulevard streetscape enhancements is as follows:

1. **TSP adoption:** Adopt the recommended enhancements (Main Street to 10th Street) into the Oregon City TSP. Through this action, the community would:

   a. Identify the need for cross-section changes along McLoughlin Boulevard for further development.

   a. Demonstrate the public support necessary to seek and secure funding to design and construct the recommended improvements on McLoughlin Boulevard.

2. **Partner agency coordination and interim actions:** Prior to identifying funding, the partner agencies led by Oregon City would:

   a. Identify any specific upfront agency commitments.

   b. Emphasize ongoing coordination with associated government entities.

3. **Funding:** Seek funding for the design and construction phases of the Project.

   a. Explore opportunities for federal, state, and regional grant funding opportunities.

4. **Design:** Following Steps 1–3, prepare plans, specifications, and cost estimates.

5. **Construction:** Using the plans, specifications, and estimates, advertise the construction contract for competitive bids. Once the contracting mechanism is determined (e.g., traditional design-bid-build or an alternative delivery method), the Project will be advertised for construction bidding and constructed. If an alternative delivery method is selected, Steps 4 and 5 may be combined.

Supporting Documents

The following memoranda have more information on all the subjects discussed in this report.

Technical Memorandum #1: Corridor Vision	This memorandum presents the Corridor Vision Statement, crafted based on a review of City of Oregon City plans and policy documents.
Purpose & Need Statement	This memorandum describes the Purpose and Need for the Project, serving as the basis for developing methods and criteria for narrowing the range of alternatives.
Technical Memorandum #2: Evaluation Criteria and Performance Measures	This memorandum articulates the evaluation criteria and performance measures developed to fulfill the Corridor Vision Statement and the Purpose and Need Statement for the Project.
Technical Memorandum #3: Plans and Policies Review	This memorandum summarizes the existing plans, regulations and policies that are relevant to the McLoughlin Boulevard Enhancements - 10th Street to tumwata village Project (Project). The summary describes the relevance of each document to the Project, identifying potential issues and considerations that will guide the development and evaluation of the alternative concepts.
Technical Memorandum #4: Alternative Development and Analysis	This memorandum serves as an overview of the preliminary six alternative concepts developed for the Project.
Technical Memorandum #5: Alternative Safety and Active Transportation Analysis	This memorandum provides technical analyses and summarizes key considerations for integrating the design alternatives developed in Technical Memorandum #4 into adjacent active transportation networks.
Technical Memorandum #6: Most Promising Alternatives	This memorandum assesses and identifies three alternatives to further develop through conceptual design and screening.
Technical Memorandum #7: Preferred Shared-Use Path Alternative	This memorandum presents the recommended shared-use path alternative, its alignment, and the streetscape improvements along McLoughlin Boulevard between 10th Street and tumwata village.
Technical Memorandum #8: Implementation Plan	This memorandum presents the implementation plan for the recommended alternative. It identifies potential roles for different agencies and stakeholders; outlines appropriate next steps; and details City and agency responsibilities.
Planning-Level Cost Opinion	This report documents the planning-level cost opinion, including key assumptions and considerations.
Public Involvement Report	This report outlines the public outreach activities conducted as part of the Project.

McLoughlin Blvd Enhancement Phase 3 Corridor Plan

(10th Street to Railroad Tunnel)

Transportation System Plan (TSP) Amendments

Amend the following projects in the TSP:

Project #	Project Description	Project Extent	Project Elements	Priority	Cost Estimate
S3	OR 99E Shared-Use Path	10th Street to Railroad Avenue	Add a shared-use path on the west side of the street	Long Term Phase 2	~~Included with D74~~$90,120,000
D74	McLoughlin Boulevard Improvements – Phase 3	10th Street to Main Street	Widen OR 99E to a five-lane cross-section that includes two travel lanes in each direction and a center two-way left-turn lane and/or a median to improve access management. The project will also improve pedestrian and bicycle facilities.	Long Term Phase 2	$8,743,000~~1 4,300,000~~

LEGISLATIVE STAFF REPORT AND RECOMMENDATION

A preliminary analysis of the applicable approval criteria for a legislative proposal is enclosed within the following report.
October 21, 2024

HEARING DATE: October 28,2024 **-** Planning Commission

FILE NUMBER: GLUA 24-000023**:** LEG-24-00002

APPLICATION TYPE: Legislative (OCMC 17.50.170)

APPLICANT: City of Oregon City, c/o Public Works Department,
PO Box 3040, Oregon City, OR 97045
Dayna Webb Public Works Director

REQUEST: Legislative. *McLoughlin Blvd Enhancements (Phase 3):* The Public Works Department proposes an update to the Transportation System Plan, an Ancillary Document to the Oregon City Transportation System Plan, and the OC2040 Comprehensive Plan.

LOCATION(S): City Wide/ Two Rivers

17.50.170 - Legislative hearing process.

A. Purpose. Legislative actions involve the adoption or amendment of the city's land-use regulations, comprehensive plan, maps, inventories and other policy documents that affect the entire city or large portions of it. Legislative actions which affect land use must begin with a public hearing before the planning commission.
B. Planning Commission Review.
1. Hearing Required. The planning commission shall hold at least one public hearing before recommending action on a legislative proposal. Any interested person may appear and provide written or oral testimony on the proposal at or prior to the hearing. The community development director shall notify the Oregon Department of Land Conservation and Development (DLCD) as required by the post-acknowledgment procedures of ORS 197.610 to 197.625, as applicable.
2. The community development director's Report. Once the planning commission hearing has been scheduled and noticed in accordance with Section 17.50.090(C) and any other applicable laws, the community development director shall prepare and make available a report on the legislative proposal at least seven days prior to the hearing.
3. Planning Commission Recommendation. At the conclusion of the hearing, the planning commission shall adopt a recommendation on the proposal to the city commission. The planning commission shall make a report and recommendation to the city commission on all legislative proposals. If the planning commission recommends adoption of some form of the proposal, the planning commission shall prepare and forward to the city commission a report and recommendation to that effect.

C. City Commission Review.
1. City Commission Action. Upon a recommendation from the planning commission on a legislative action, the city commission shall hold at least one public hearing on the proposal. Any interested person may provide written or oral testimony on the proposal at or prior to the hearing. At the conclusion of the hearing, the city commission may adopt, modify or reject the legislative proposal, or it may remand the matter to the planning commission for further consideration. If the decision is to adopt at least some form of the proposal, and thereby amend the city's land-use regulations, comprehensive plan, official zoning maps or some component of any of these documents, the city commission decision shall be enacted as an ordinance.
2. Notice of Final Decision. Not later than five days following the city commission final decision, the community development director shall mail notice of the decision to DLCD in accordance with ORS 197.615(2).

IF YOU HAVE ANY QUESTIONS ABOUT THIS APPLICATION, PLEASE CONTACT THE PLANNING DIVISION OFFICE AT (503) 722-3789.

EXECUTIVE SUMMARY

The City of Oregon and its Commission have spent the past year exploring the best options to improve pedestrian and bike access along McLoughlin Blvd/99E. This long-term project involved a conceptual-level feasibility and alternative analysis to determine the best approach for the final Phase 3 stretch of the McLoughlin Blvd Enhancement Plan, which was initially adopted in 2005. Phases 1 and 2 were previously approved and constructed.

A 1940s viaduct and an s-curve have constrained this area, creating a significant gap for non-vehicle travel along the Willamette River shoreline. Only one option emerged as both constructible and potentially permittable: a long-span structure parallel to the viaduct.

- If the community agrees that a parallel structure (long span) should be added to the Transportation System Plan as the preferred approach, the Planning Commission should recommend adoption to the City Commission.

- If the community does not desire to add this concept to the Transportation System Plan, the Planning Commission should recommend that a parallel structure (long span) not be added, recommend a plan to direct pedestrians and bicycles to Main Street, and only adopt the portion of the streetscape plan that are independent of the viaduct structure.

Submittal of additional grants to refine the conceptual long span design and to potentially build portions of the non-viaduct streetscape will move forward, contingent on its adoption into the Transportation System Plan.

I. BACKGROUND:

The City of Oregon City and the Oregon Department of Transportation (ODOT) are partnering to evaluate options for a shared-use pedestrian and bicycle path and streetscape enhancements on both sides of McLoughlin Boulevard between 10th Street and tumwata village. This project is the last and most complex phase of Oregon City's McLoughlin Boulevard Enhancement Plan, which has been in progress for the past 20 years.

Project Benefits and Needs

Reconnect Downtown Oregon City with the Willamette River

- The project aims to provide safe access to people who walk, access transit, bike and roll on McLoughlin Boulevard. Currently, it lacks dedicated on-street bike lanes, proper and sufficient sidewalks and railings, and a barrier to fast-moving traffic.
- Improved infrastructure for pedestrians, cyclists, and public transit users will close a substandard and unsightly transportation gap.
- Support Oregon City's tourism, economic, and community development goals by improving walking and biking facilities to better integrate and re-orientate downtown's relationship with the Willamette River.

The project is located on OR 99E, also known as McLoughlin Boulevard, an Oregon Department of Transportation facility. The corridor is designated as a Regional Bikeway and Pedestrian Parkway, with frequent transit service running parallel to the corridor. However, the final phase of the McLoughlin Boulevard Enhancement Plan has proven to be the most challenging, as it is intertwined with the OR 99E viaducts and crosses the Highway 43 bridge alignment. Transit users and pedestrians often feel unsafe due to inadequate lighting, narrow sidewalks, and deteriorating railings that fail to provide a barrier from adjacent fast-moving traffic.

The McLoughlin Boulevard Enhancement Plan was adopted in 2005. Phases 1 and 2 of the plan have been completed. Unfortunately, the viaducts, located between 8th and 10th Streets, are not expected to be replaced with an expanded structure supporting a widened sidewalk, which is necessary to provide the needed width for safe bicycle and pedestrian access. Attaching a new path to the existing viaduct is also not feasible due to its age and structural design.

To address this critical gap in our active transportation network, the City needs to update the options within this section of the corridor. These options could include a separate structure that runs parallel to the viaduct at the same or different grade. The project has two main goals that address barriers to investing and revitalizing properties that front McLoughlin Boulevard in Oregon City:

- Close the gap and provide safe pedestrian and bicycle access by identifying the best location for a shared-use path adjacent to the viaduct.
- Provide a conceptual complete street design for McLoughlin Boulevard (both sides) from 10th Street to the 99E tunnel/Railroad Avenue.

This conceptual project will enable the City to complete the Alternatives Identification and Evaluation phase to determine how to address this gap. Once a preferred alternative is identified, the City will proceed with a more detailed design and apply for grants to build all or portions of the section.

Active Transportation
Active transportation is human-powered transportation that engages people in healthy physical activity while they travel from place to place. People walking, bicycling, using strollers, wheelchairs, and mobility devices, skateboarding, and rollerblading are all active transportation.
Active transportation supports transit. These modes are effective at reducing vehicle emissions, bridging the first- and last-mile gap, conserving fuel, supporting downtown economic development and improving individual and public health.

No-Build Alternative

As part of alternative development and evaluation, the project team also examined a reroute, or no-build, Main Street alternative. The No-Build alternative provides a parallel alignment through downtown Oregon City via 10th Street and Main Street. Main Street has a right-of-way that is approximately 60 feet and includes two travel lanes, two parking lanes (totaling about 40 feet), and 10-foot sidewalks on each side abutting 0-foot building setbacks. There are currently curb extensions at most intersections and shared-lane markings, or "sharrows."

The project team explored and evaluated two primary options for improving bicycle access on Main Street as part of the No-Build Main Street alternative. Based on this evaluation, conversations with Oregon City staff, and a review of background documents, the team it was determined that the No-Build Main Street alternative does not adequately address the Project's Purpose and Need.

Design Process and Commission Direction

After the December 2023 virtual open house, the design team began the hard work of ground-truthing the most promising shared-use path alignments along McLoughlin Blvd. What they found was an overlapping of complexity at the existing river's edge. This was not a complete surprise, but it definitely necessitates a nonstandard approach to designing a solution.

None of the designs from the open house were able to move forward due to the complexity of the area. At the April 9 City Commission Worksession, the design team outlined two promising alternatives that met the City's Commission goals: 1. Conventional Viaduct + 2 Signature Spans and 2. Long Span. While both options provide a path along the river, only the long-span approach significantly minimized foundation excavation, reduced/removed in-water work, and provided a more compatible design with the historic arch bridge.

If there was no desire to move forward on a riverside shared-use path, the most likely approach will be to design streetscape improvements (trees, landscaping, sidewalks) on the non-viaduct portions of 99E and use wayfinding to send bicycles and pedestrians over to Main Street. Bicycles would share the road via painted sharrows.

At the May 15 City Commission work session, the Commission reviewed the work date, including public comments. They directed staff and the consultant team to continue their technical investigations on the long-span approach, begin the design work for streetscape improvements, and return in August for an update.

At the August 13, 2024, City Commission Work session, the City Commission directed staff to continue the work needed to complete the conceptual study, including the long-span approach, and prepare for its adoption into the Transportation System Plan (TSP) in the fall. The Commission chose to move forward with both open space and parking options in the three areas discussed at the meeting (along the viaduct, under the arch bridge, and inside the elbow). Adopting the concept into the TSP will allow the city to apply for additional grants for the long-span and street improvements, separately or together. Click on the work session presentation for more details.

Long Span Option

OVERVIEW OF FINDINGS TO SUPPORT ADOPTION OF PLAN

There is a gap in safe, comfortable, and accessible facilities for people of all ages and abilities who are walking and biking on McLoughlin Boulevard. The cross-section along McLoughlin Boulevard between 10th Street and the proposed tumwata village and riverwalk consists of curb-tight sidewalks and four vehicle lanes. This cross-section does not meet the current ODOT Highway Design Manual or City of Oregon City design standards. It creates an imbalance between how the needs of nonmotorized and motorized users are being addressed in the corridor. The Project location has been determined to result in a Level of Traffic Stress of 4.1 People of most ages and abilities do not feel comfortable and/or able to walk, bike, or roll along this segment, creating a barrier in the regional active transportation link between Oregon City and Portland.

Oregon City's waterfront is currently disjointed and not seen as a contiguous amenity. Locally, active transportation facilities along McLoughlin Boulevard are needed to provide connections to the planned tumwata village and riverwalk, historic downtown Oregon City, envisioned pedestrian and bicycle bridge, and recreation opportunities along the Willamette River. The Willamette River is a culturally significant site, and the Historic Arch Bridge is a historically significant structure. This active transportation connection will create additional opportunities for people to access, experience, and visually imagine the historic significance of the river, falls, and adjacent lands, while honoring the indigenous connections to the land and acknowledging traditional ways of movement along waterways.

The chosen design will support Oregon City's tourism, economic, and community development goals by improving walking and biking facilities to better integrate and reorient the downtown area's relationship with the Willamette River. Active transportation facilities are shown to improve economic conditions by creating attractive and walkable business districts and providing access to various destinations adjacent to residential areas, and supporting the Oregon City 2040 Comprehensive Plan policies related to multimodal connectivity and transportation demand management.

Vehicular congestion impacts the site's historical, cultural, and environmental aspects. Vehicular congestion creates noise and emissions that detract from the historic, cultural, and environmental aspects of the site. A continuous shared use path connection is needed to create an opportunity for transportation mode shifts consistent with the region's climate goals, and ensure that historical, cultural, and environmental resources are preserved for future generations. The physical design of the shared-use path needs to address the function of the facility in a way that minimizes or eliminates local environmental impacts and does not inflict harm on the river or nearby communities. Any work done in the study area needs to recognize the special role and voice of tribes in the Willamette Falls area of both land and water and emphasize tribal and community involvement in decision-making.

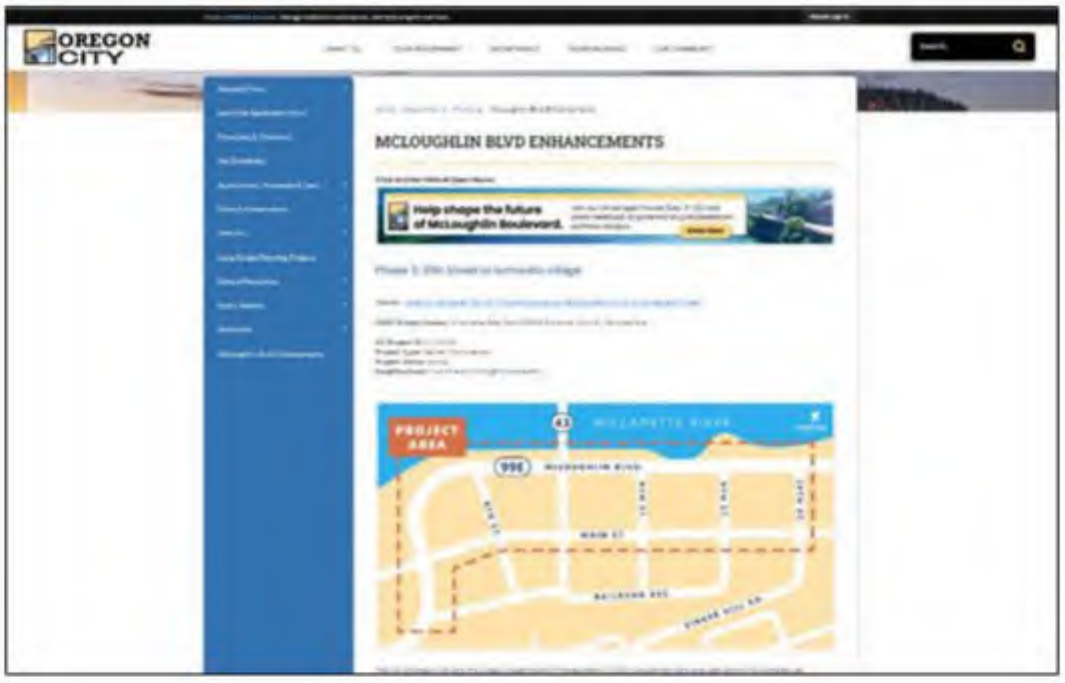
PROCESS

Adoption of the code amendments is a legislative action that requires review and recommendation from the Planning Commission before being adopted by the City Commission following public hearings.

Public Involvement and Public Comment

The creation of the McLoughlin Boulevard Enhancement Plan provided opportunities for public involvement in the Legislative decision-making process through community outreach, online surveys, public hearing process, project mailings, newspaper noticing, social media postings, meetings with the Transportation Advisory Committee, Parks and Recreation Advisory Committee, Historic Review Board and Citizen Involvement Committee. A full description of the public engagement process is included in the Public Outreach Memo and the full McLoughlin Boulevard Enhancement Plan.

This Project will enable the City to complete the Alternatives Identification and Evaluation phase to determine how to address the infrastructure gap along McLoughlin Boulevard. Once a preferred



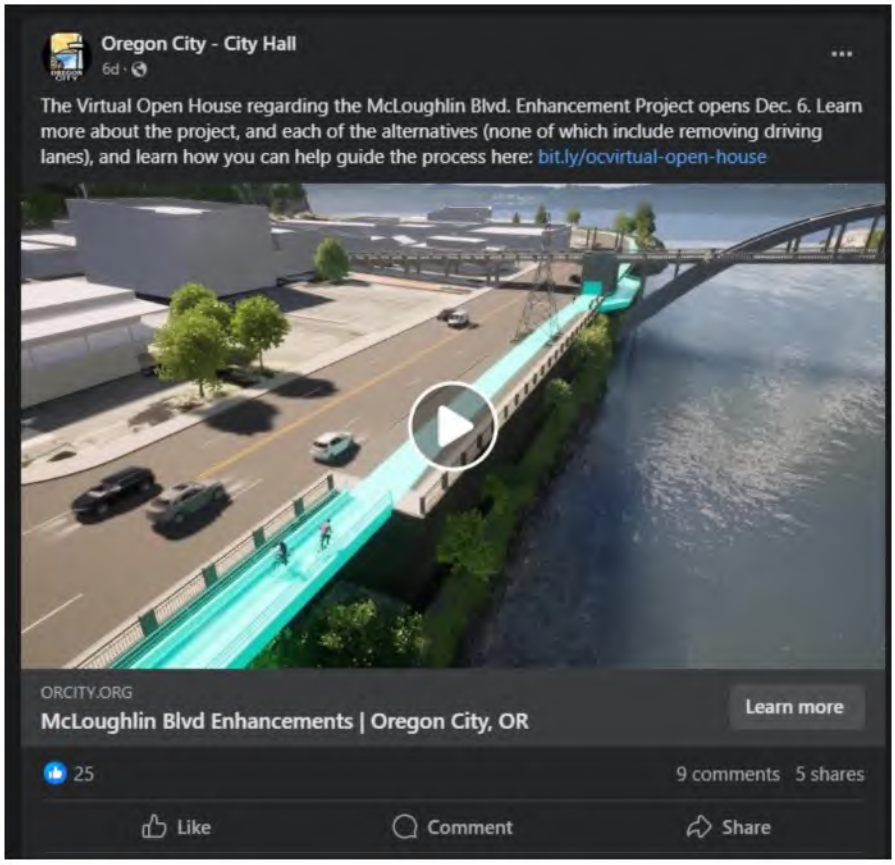
alternative is identified, the City will proceed with a more detailed design and apply for grants to build all or portions of the alignment.

One round of outreach was conducted during the Alternatives Identification and Evaluation phase to bring awareness and gather community feedback on the alternatives being considered.

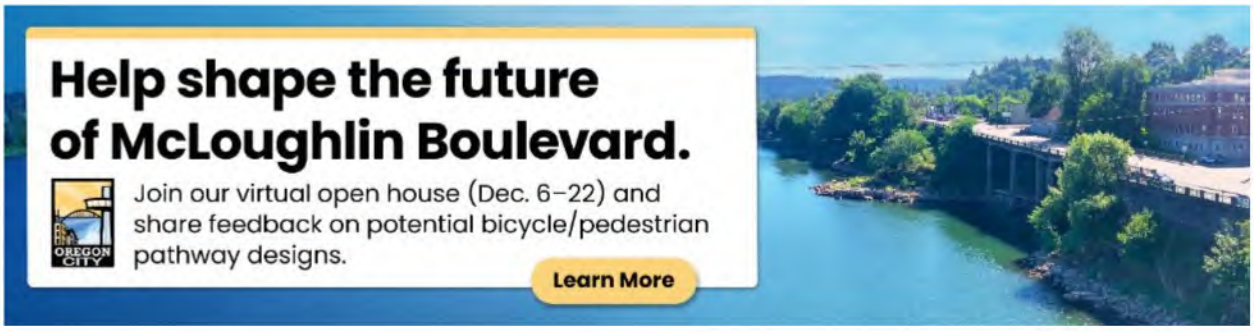
The first opportunity for the public to provide input on the plan began in December 2023. The primary purpose of this initial outreach was to create awareness about the Project, its benefits, and potential burdens or impacts, as well as solicit public input on the initial alignment alternatives.

Overarching Materials and Notifications: Tools used to convey Project information and publicize outreach opportunities.

- Website: A Project website (bit.ly/McLoughlinBlvd3) was developed with new graphics, maps, and approved content. City staff updated the page to promote key milestones and engagement events, including the December 2023 virtual open house. Below is an example of website content.



- Community Database and Comment Log: A community database and comment log were used to track comments, responses, constituent, and interested party contacts.
- Project Fact Sheet: a Project Fact Sheet was developed in late 2023, it included information about the Project, benefits and needs, anticipated timelines, and public engagement opportunities. The fact sheet was also translated into Spanish. Below is the fact sheet.



- Direct Mail: Project staff designed a postcard (Figure 2) to notify neighboring residents about the online open house. The postcard was mailed to approximately 345 residents on November 27, 2023. City staff printed and distributed 300 additional postcards to downtown Oregon City businesses and residents.

- Social Media: Staff shared the December 2023 open house link and a City-produced Project video on Facebook and X. The posts directed visitors to the website to learn more about the Project and the virtual open house event.

- Advertising: The City purchased a digital ad campaign on Oregon City News (oregoncitynewsonline.com), with 30,000 impressions to publicize the December 2023 virtual open house. Ads were produced in several formats to accommodate mobile, desktop, and tablet devices.

- Email Newsletters: City staff sent three email notifications about the December 2023 open house to the projects interested party list.

View this email in your browser

McLoughlin Blvd Enhancements

Join our virtual open house (Dec 6-22) and share feedback on potential bicycle/pedestrian pathway designs

Attend Virtual Open House

During the open house, you will have an opportunity to learn more about the project and provide feedback on potential design alternatives. Your feedback will help us assess the most effective options for community transportation needs along McLoughlin Boulevard. You can also enter the virtual open house from the project page.

This phase of the plan will evaluate options within the corridor to address the gap in our pedestrian and bicycle network and better understand how you currently walk/or hope to use the corridor. Once a preferred alternative for the

- Interested Party Interviews and Briefings: The project team held three interviews in early November 2023 to collect feedback on the corridor's issues and potential alignments. These interested parties represent transportation, education and housing sectors in Clackamas County and Oregon City.
    - Each interview included the following questions:
        - What are the most critical issues you believe the Project should address? What do you believe others in your organization or community will see as the most critical issues?
        - Of the potential alignments shown, which do you believe is the most promising and why? Is there another alignment you believe is better than the ones shown or another that should be assessed?
        - Do you see pros or cons to having a new shared-use pedestrian and bicycle path within the study area? If so, please describe them.
        - What are your/your community's priorities that should be used to evaluate the different potential alignments?
        - Do the people you know in the area feel comfortable biking or walking to get around? If not, can you share specific safety concerns for people biking or walking in the study area?
        - As we look at the Project corridor, are there areas on either side of the highway that are important to address or call out in the conceptual design phase? What should decision makers understand about this section of McLoughlin Boulevard as they work to design a solution?

Affiliation	Organization Details	Interview Date

The Street Trust	The Street Trust advocates for multimodal transportation options in Oregon that prioritize safety, accessibility, equity, and climate justice.	Nov. 2, 2023
Oregon City School District	Oregon City School District is the 16th largest district in the state of Oregon, serving nearly 8,000 students and employing 927 professionals.	Nov. 2, 2023
Housing Authority of Clackamas County	The Housing Authority provides affordable, safe, and sanitary housing opportunities for Clackamas County residents.	Nov. 6, 2023

- Online Open House: The Project's online open house was launched on the Project website on Dec. 6, 2023. The online platform provided informational stations to learn about the Project and provide feedback via the embedded survey, which closed on Dec. 22, 2023. Users were invited to provide feedback on the proposed design alternatives and priorities for the McLoughlin Boulevard corridor. The webpage also included a general comment form where users could submit other feedback regarding the Project.

- The Virtual Open House webpage included the following stations:
  - **Project Overview:** This slide included general information about the Project, including background details about the McLoughlin Boulevard Enhancement Plan, the identified study area, and Project benefits.
  - **Project Timeline:** A general Project schedule was shared on this slide, including relevant public engagement, planning, and design milestones. Community members were informed about the public engagement process and participation opportunities. This slide detailed the alternative development phase and the timeline for selecting a preferred alternative.

- **Project Purpose and Need:** The Purpose and Need Statement describes the transportation problems in the corridor and provides context for decision makers as they consider the best design options. Community members were invited to share their thoughts regarding this statement.
- **Corridor Vision:** The Corridor Vision includes several statements regarding the proposed Willamette Falls Path extension and streetscape enhancements. Community members were invited to share their thoughts regarding this Project topic.
- **Evaluation Criteria & Performance Measures:** This station informed visitors about the selected evaluation criteria and performance measures. The evaluation criteria were developed based on the Project's Purpose and Need Statement and the goals of Oregon City's Transportation System Plan. The Project team developed a set of performance measures to assess and differentiate between the design alternatives. These measures will provide a framework for selecting a preferred alternative.

Input Opportunity

- **Design Alternatives:** Visitors were invited to provide input on several design alternatives as part of the Project.
- **Your Priorities:** The City collected feedback from community members about community transportation priorities along McLoughlin Boulevard.

Overall, 169 users accessed the virtual open house, and 154 comments were received through the virtual open house, Project website, and emails. 47% of users (81 users) were identified using a device to access the virtual open house from Oregon City or Portland.

Overall, the majority of community members voted for Alternative 1B: High Route, a design with a new pathway structure at street level next to McLoughlin Boulevard. This path would connect to McLoughlin Boulevard near 10th Street and reconnect near the future tumwata village development. Participants also voted for a pathway design through the Historic Arch Bridge columns, as shown in Alternatives 1B and 1C.

- City Conducted Outreach Meetings & Briefings: The City conducted targeted outreach to promote the open house and collect feedback during various phases of the project.

City staff attended the following outreach meetings and briefings with various committees and organizations.

Committee/Organization	Date
Planning Commission	Sep. 25, 2023
Transportation Advisory Committee	Oct. 24, 2023
Parks and Recreation Advisory Committee	Oct. 26. 2023
Citizen Involvement Committee	Nov. 6, 2023
Clackamas County Pedestrian and Bikeway Advisory Committee	Nov. 7, 2023
Rotary Club	Feb 7, 2024
Planning Commission	May 13, 2024

DOCA- Happy Hour White Rabbit	May 1, 2024

City staff also briefed the Oregon City Commission during key decision points and project milestones.

Briefing Date	Topic
Sep. 6, 2023	*Project overview*
Nov. 7, 2023	*Review approval criteria, corridor vision, list of alternatives*
Dec. 12, 2023	*Alternatives analysis update*
Apr. 9, 2024	*Alternatives analysis update*
May 15, 2024	*Direction to move forward on the long-span approach*
Aug. 13, 2024	*Long-span technical review and streetscape design update*
September 4, 2024	*Resolution 24-24 to support 2028-2030 Regional Flexible Fund Allocation Program – Step 1A.1 New Project Bond Program*

- City Communications: City staff leveraged several communication channels to share information about the project. These channels include social media posts, a monthly e-trail news update in the City's Winter Trail News publication, and coordination for a Dec. 2023 earned media article in Oregon City News.

Between Nov. 3, 2024, and Aug. 8, 2024, the City also sent six (6) emails to 215 recipients comprised of interested parties and subscribed users. The emails included project updates and opportunities to provide input. One thousand two hundred sixty-three (1,263) emails were sent, with a 65% open rate.

Additionally, staff have completed Fall 2024 Outreach Events, as noted below:

Citizen Involvement Committee (CIC)	October 7, 2024
Downtown Oregon City Association (DOCA)	November 12, 2024
Planning Commission Work Session	September 23, 2024
Natural Resources Committee (NRC) Parks and Recreation Advisory Committee (PRAC) JOINT MEETING	October 9, 2024
Transportation Advisory Committee (TAC)	September 17, 2024
Canemah Neighborhood Association (CNA)	September 19, 2024
Two Rivers Neighborhood Association	October 23, 2024

The NRC and PRAC provided additional direction on the need to prioritize tree retention over mitigation in the design refinement and construction process, as well as supporting birds, bats, and other animals nesting in the design long-span design process. This language has been added the draft document. PRAC and NRC members also encouraged coordination to allow for and not impede existing shoreline access to anglers.

Riparian Shoreline and Habitat Considerations

This section of the Willamette River is characterized by a rocky shoreline with patches of riparian vegetation. It features mature trees such as big-leaf maple and various shrub varieties along the shoreline, providing habitat for supporting species. It is important to prioritize the preservation of trees over mitigation as the design is developed around the location of bridge foundations and structures. Make use of the bridge's habitat features to support nesting bats, birds, and other animals. The final design should also consider supporting existing and planned angler access when possible.

The Legislative Process as it relates to the Oregon City Comprehensive Plan

The applicable approval criteria for Legislative action are the guidance provided in the Oregon City Comprehensive Plan, the goals and policies of the Oregon City Comprehensive Plan, and any applicable statewide planning goals.

Plan implementation process;

At the September 4, 2024 meeting, the City Commission directed staff to continue the work needed to complete the conceptual approach and start the Legislative adoption process.

The first evidentiary public hearing for the proposed amendments will be held with the Planning Commission, following the notice procedures for legislative action per OCMC 17.50. The City Commission public hearing will be scheduled once the Planning Commission has completed its review and provided a recommendation on the proposed amendments.

The Department of Land Conservation and Development was notified as required by ORS 197.610 – 197.625. The Staff Report will be made available at least seven days prior to the public hearing and the application was processed according to the Legislative Hearing Process as required under Oregon City Municipal Code 17.50.170. Implementation of the Plan is discussed further in the staff report.

Background on the purpose of plan adoption

The Plan reflects community needs, desires, attitudes and conditions

As stated in the corridor vision: The proposed Willamette Falls Path extension and streetscape enhancements contribute to the sense of place and community identity as an urban corridor and community gateway. The chosen design will promote safety through context-sensitive design that discourages speeding and improves the walking and biking experience along the corridor. The path provides a regional link accessible to users of all ages and abilities, filling a key active transportation gap and providing a continuous link to existing and planned open spaces along the Willamette and Clackamas Rivers, including the tumwata village development, and connections to other transportation links such as a future recreational/commuter river ferry and the Oregon City–West Linn pedestrian–bicycle bridge. The proposed path is representative of the local needs and priorities of the Oregon City community and has been developed as an implementable and fundable alternative.

The Plan helps to guide land use actions, including an examination of trends

The adoption of the revised corridor plan for Phase 3 will allow staff to provide direction on a frontage improvement required as part of an abutting land use approval that proportionally triggers improvements along the corridor.

Public Notice and Comments

This is a legislative action that requires public notice pursuant to OCMC 17.50.090.C. - *Notice of Public Hearing on a Legislative Proposal*. The Community Development Director provided the required Post Acknowledgement Plan Amendment (PAPA) notice to the Oregon Department of Land Conservation and Development on September 17, 2024. Notice of the October 28, 2024, Planning Commission public hearing was also provided to the Citizen Involvement Committee,

Natural Resources Committee, Neighborhood Associations, and affected service districts, agencies, and parties by email on October 3, 2024

II. DECISION-MAKING CRITERIA

The remainder of this staff report provides additional findings to demonstrate that the proposed amendments are consistent with applicable approval criteria.

Chapter 17.68 - Zoning Changes and Comprehensive Plan Amendments

17.68.010 - Initiation of the amendment.
A text amendment to the comprehensive plan, or an amendment to the zoning code or map or the Comprehensive Plan map, may be initiated by:
A. A resolution request by the City Commission;
B. An official proposal by the Planning Commission;
C. An application to the Planning Division; or.
D. A Legislative request by the Planning Division.
All requests for amendment or change in this title shall be referred to the Planning Commission.

Response: The proposal qualifies as initiated as a legislative request by the Public Works Department at the direction of the City Commission.

17.68.015 –Procedures.
Applications shall be reviewed pursuant to the procedures set forth in Chapter 17.50.

17.50.170 - Legislative hearing process.
A. Purpose. Legislative actions involve the adoption or amendment of the city's land use regulations, comprehensive plan, maps, inventories and other policy documents that affect the entire city or large portions of it. Legislative actions which affect land use shall begin with a public hearing before the planning commission.

B. Planning Commission Review.
1. Hearing Required. The planning commission shall hold at least one public hearing before recommending action on a legislative proposal. Any interested person may appear and provide written or oral testimony on the proposal at or prior to the hearing. The community development director shall notify the Oregon Department of Land Conservation and Development (DLCD) as required by the post-acknowledgment procedures of ORS 197.610 to 197.625, as applicable.

C. City Commission Review.
1. City Commission Action. Upon a recommendation from the planning commission on a legislative action, the city commission shall hold at least one public hearing on the proposal. Any interested person may provide written or oral testimony on the proposal at or prior to the hearing. At the conclusion of the hearing, the city commission may adopt, modify or reject the legislative proposal, or it may remand the matter to the planning commission for further consideration. If the decision is to adopt at least some form of the proposal, and thereby amend the city's land use regulations,

comprehensive plan, official zoning maps or some component of any of these documents, the city commission decision shall be enacted as an ordinance.
2. Notice of Final Decision. Not later than five days following the city commission final decision, the community development director shall mail notice of the decision to DLCD in accordance with ORS 197.615(2).
Finding: Complies This legislative action followed the procedures found in OCMC 17.50.170 including meetings with the Citizen Involvement Committee, Natural Resource Committee, Planning Commission, Transportation Advisory Committee and City Commission where applicable.

17.68.020 - Criteria.
The criteria for comprehensive plan amendment or text or map amendment in the zoning code are set forth as follows:
A. The proposal shall be consistent with the applicable goals and policies of the comprehensive plan;
Finding: Complies This legislative action is consistent with the applicable goals and policies of the comprehensive plan as detailed in the responses below. Therefore, the proposed amendments are consistent with Criterion (A).

0C2040 Oregon City Comprehensive Plan

According to the OC2040 Comprehensive Plan (Appendix 3): "Ancillary plans are adopted by the City Commission for such things as parks and recreation, transportation systems, water facilities, and sewer facilities. Usually prepared by City departments through a public process, ancillary plans are approved by the City Planning Commission and adopted by the City Commission to provide operational guidance to city departments in planning for and carrying out city services. These plans are updated more frequently than the comprehensive plan."

The conceptual refinement of the McLoughlin Blvd Enhancement Plan- Phase 3 TSP Project S3 (OR 99E Shared-Use Path) will be updated in the Transportation System Plan (TSP) an ancillary document to the Oregon City Comprehensive Plan.

options.

Conformity of the proposal with the city's comprehensive plan;

HEALTHY AND WELCOMING COMMUNITIES

GOAL 1
Implement and maintain a community engagement program that provides broad and inclusive opportunities for all Oregon City community members to learn about and understand city government processes, including land use planning, and participate meaningfully in decisions that impact their communities.

POLICY 1.2 Actively seek input from a diverse range of participants and enhance engagement opportunities for community members with barriers (language, disability, income, age, technology) through services and methods that bolster inclusive participation.

POLICY 1.4 Utilize innovative forms of communication technology to enhance the City's public engagement efforts.

STRATEGY 1.4.A Explore meaningful engagement techniques and tools that allow for multiple forms of public engagement through in person events, on-line tools, and hybrid

Finding: Complies: As mentioned in the Public Involvement and Public Comment section staff report and Exhibit B of the staff report, the city used a wide variety of outreach methods, noticed City Commission briefings, online surveys, mailed flyers, earned media articles, purchased ads, social media, meetings with property owners, boards, committees, and neighborhood associations, email updates to interested parties, and reaching out to individuals who are not typically asked for their opinions on how they use the corridor, such as the Housing Authority of Clackamas County and active transportation advocacy groups like Oregon Walks.

GOAL 2
Acknowledge, protect, enhance, and commemorate Oregon City's historic, artistic, and cultural resources.

POLICY 2.1 Promote the Willamette and Clackamas Rivers as a community benefit for cultural connection and understanding.

POLICY 2.2 Recognize and celebrate the history of tribal presence in Oregon City and seek opportunities to educate community members and elevate understanding.

POLICY 2.4 Identify and protect important artistic and cultural resources and historic amenities through programs, designation, interpretive signage, and other means to increase awareness and generate appreciation.

POLICY 2.5 Provide activities and programs for residents and visitors that weave together historic, artistic, and cultural resources, education, and recreation.

Finding: Complies This active transportation connection will create additional opportunities for people to access, experience, and visually imagine the historic significance of the river, falls and adjacent lands, while honoring the indigenous connections to the land and acknowledging traditional ways of movement along waterways. Future work to design and construct the corridor would continue to build on this with placemaking along the corridor.

Oregon City's waterfront is currently disjointed and not seen as a contiguous amenity. Locally, active transportation facilities along McLoughlin Boulevard are needed to connect the planned tumwata village and riverwalk, historic downtown Oregon City, envisioned pedestrian and bicycle bridge, and recreation opportunities along the Willamette River. The Willamette River is a culturally significant site, and the Historic Arch Bridge is a historically significant structure. This active transportation connection will create additional opportunities for people to access, experience, and visually imagine the historic significance of the river, falls, and adjacent lands while honoring the indigenous connections to the land and acknowledging traditional ways of movement along waterways. The alternative analysis demonstrated that the only feasible connection for this section of McLoughlin Blvd would intersect the historic Arch Bridge, which, if deemed an adverse effect in

later design refinements- would be consistent with Sec 106 and 4F alternatives analysis process to determine approval with proportional mitigation.

Roy Watters, archaeologist, and ODOT Tribal Liaison coordinated the review and provided feedback to ODOT staff and the design team throughout the alternative design process. While this is a local conceptual alternative analysis and tribal participation was sought to ensure the design process did not result in a project that could not be permitted - Formal government-to-government consultation will occur at the time of federal permitting, as the project is likely to be considered a government undertaking and subject to the Sec 106 and Historic Preservation Act, as well as Section 4F of the US Department of Transportation Act.

DIVERSE ECONOMY

POLICY 1.6 Promote the city's destinations, natural resources, and historic and cultural amenities to grow the tourism industry.

> STRATEGY 1.6. Encourage the development of a strong and healthy Historic Downtown retail, office, cultural, and residential center.
>
> STRATEGY 1.6.B Working with major stakeholders, develop and implement a strategy to help the Historic Downtown Area enhance its position as a retail district. Such a strategy might include funding for a "Main Street" or similar program.
>
> STRATEGY 1.6.C Ensure land uses and transportation connections that support tourism as an important aspect of the City's economic development strategy. This includes important cultural and historical amenities.

Finding: Complies Active transportation facilities are shown to improve economic conditions by creating attractive and walkable business districts and providing access to various destinations, local businesses, and jobs. Active transportation facilities contribute to redevelopment and other investments along the corridor. Vehicle congestion and parking limitations discourage travel in downtown Oregon City and are a barrier to businesses and expanded economic development. Beyond the proposed OR99E corridor, congestion leads to neighborhood spillback and cut-through traffic and detracts from the sense of place and community identity desired by residents, business and property owners, and visitors to Oregon City. The lack of complete walking and biking facilities, including the gap represented by the termination of the current Willamette Falls path, also discourages travel to downtown Oregon City as a regional destination. A complete connection for people walking, biking, and rolling along OR99E and to historic downtown Oregon City, Oregon City Transit Center, and the municipal elevator is needed to encourage mode shift4, support transportation demand management efforts, minimize impacts to adjacent residential areas and support the Oregon City 2040 Comprehensive Plan's policies related to multimodal connectivity and transportation demand management.

CONNECTED INFRASTRUCTURE

GOAL 1

Provide a safe, comfortable, and accessible transportation network that serves all modes of travel, including non- motorized modes.

POLICY 1.1 Plan for and develop multi-modal connectivity throughout Oregon City, with an emphasis on access to community services, amenities, and key points of interest.

STRATEGY 1.1.A Make investments to accommodate multi-modal traffic as much as possible to include bike lanes, bus turnouts and shelters, sidewalks, etc., especially on major and minor arterial roads, and in regional and employment centers.

POLICY 1.2 Reduce Oregon City's carbon footprint by supporting and emphasizing non-motorized modes.

STRATEGY 1.2.A Provide an interconnected and accessible pedestrian system that links residential areas with major pedestrian generators such as employment centers, public facilities, and recreational
areas.

STRATEGY 1.2.B Provide a well-defined and accessible bicycle network that links residential areas, major
bicycle generators, employment centers, recreational areas, and the arterial and collector roadway network.

STRATEGY 1.2.C Construct bikeways and sidewalks and require connectivity of these facilities to reduce the use of petroleum-fueled transportation.

POLICY 1.3 Promote safety by implementing street design that equally considers and serves non-motorized and motorized users.

STRATEGY 1.3.A Identify and implement ways to minimize conflict points between different modes of travel.

STRATEGY 1.3.B Improve the safety of vehicular, rail, bicycle, and pedestrian crossings

POLICY 2.4 Increase resiliency to climate change, natural hazard events, and cyber intrusions in public utility infrastructure.

Finding: Complies There is a gap in safe, comfortable, and accessible facilities for people of all ages and abilities who are walking and biking on McLoughlin Boulevard. The cross-section along OR99E between 10th Street and the proposed tumwata village and riverwalk consists of curb-tight sidewalks and four vehicle lanes. This cross-section does not meet the current ODOT Highway

Design Manual or City of Oregon City design standards. It creates an imbalance between how the needs of non-motorized and motorized users are being addressed in the corridor. The project location has been determined to result in a Level of Traffic Stress 4, in which most ages and abilities do not feel comfortable and/or able to walk, bike or roll along this segment, creating a barrier in the regional active transportation link between Oregon City and Portland.

PROTECTED ENVIRONMENT

GOAL 1
Provide and maintain a comprehensive system of parks, trails, natural resource areas, and recreation amenities that is accessible to residents of all ages and abilities, enhances the environmental and aesthetic quality of the community, and encourages healthy living.

POLICY 2.8 Protect the Clackamas and Willamette Rivers and their tributaries including Newell Creek as the centerpieces of Oregon City's natural environment.

POLICY 2.9 Establish, restore, and maintain a network of connected wildlife habitat corridors.
STRATEGY 2.9.A Conserve natural resources that have significant functions and values related to flood protection, sediment and erosion control, water quality, groundwater recharge and discharge, education, vegetation, and fish and wildlife habitat.

Finding: Complies Active transportation facilities are shown to improve economic conditions by creating attractive and walkable business districts and providing access to various destinations, local businesses, and jobs. Active transportation facilities contribute to redevelopment and other investments along the corridor. Vehicle congestion and parking limitations discourage travel in downtown Oregon City and are therefore a barrier to businesses and expanded economic development. Beyond the proposed OR99E corridor, congestion leads to neighborhood spillback and cut-through traffic and detracts from the sense of place and community identity desired by residents, business and property owners, and visitors to Oregon City. The lack of complete walking and biking facilities, including the gap represented by the termination of the current Willamette Falls path, also discourages travel to downtown Oregon City as a regional destination. A complete connection for people walking, biking, and rolling along OR99E and to historic downtown Oregon City, Oregon City Transit Center, and the municipal elevator is needed to encourage mode shift4, support transportation demand management efforts, minimize impacts to adjacent residential areas and support the Oregon City 2040 Comprehensive Plan's policies related to multimodal connectivity and transportation demand management.

This section of the Willamette River is characterized by a rocky shoreline with patches of riparian vegetation. It features mature trees such as bigleaf maple as well as various shrub varieties along the shoreline, providing habitat for supporting species. It is important to prioritize the preservation of trees over mitigation as the design is developed around the location of bridge foundations and structures. The final design will need to make use of the bridge's habitat features to support nesting bats, birds, and other animals. The final design should also consider supporting existing and planned angler access when possible.

GOAL 4
Ensure the environmental and economic health of the Willamette River Greenway (WRG) as a key feature of Oregon City and the broader region.
POLICY 4.1 Protect the significant fish and wildlife habitat of the Willamette River by maximizing the preservation of trees and vegetative cover.

POLICY 4.2 Preserve major scenic views, drives and sites of the WRG.

POLICY 4.3 Encourage access to and along the river consistent with the Oregon City Park and Recreation
Master Plan.

Finding: Complies: This section of the Willamette River is characterized by a rocky shoreline with patches of riparian vegetation. It features mature trees such as big-leaf maple and various shrub varieties along the shoreline, providing habitat for supporting species. It is important to prioritize the preservation of trees over mitigation as the design is developed around the location of bridge foundations and structures. The plan aims to make use of the bridge's habitat features to support nesting bats, birds, and other animals. The final design should also consider supporting existing and planned angler access when possible.

Vehicular congestion creates noise and emissions that detract from the historic, cultural and environmental aspects of the site. A continuous shared-use path connection is needed to create an opportunity for transportation mode shifts consistent with the region's climate goals and ensure that historical, cultural, and environmental resources are preserved for future generations. The physical design of the shared-use path needs to address the function of the facility in a way that minimizes or eliminates local environmental impacts and does not inflict harm on the river or nearby communities. Any work done in the corridor needs to recognize the special role and voice of tribes in the Willamette Falls area, comprising both land and water, and emphasize tribal and community involvement in decision-making.

Statewide Planning Goals

Response: This proposal makes no changes to the Comprehensive Plan, zoning, or land use designations for lands within the Urban Growth Boundary. Since the City's Comprehensive Plan and its ancillary documents are already acknowledged by the Oregon Department of Land Use and Conservation (DLCD), no further analysis for consistency with Statewide Planning Goals is required.

Chapter 17.50 Administration and Procedures
17.50.050 – Pre-application conference.
A. Pre-application Conference. Prior to a Type II – IV or Legislative application, excluding Historic Review, being deemed complete, the applicant shall schedule and attend a pre-application conference with City staff to discuss the proposal, unless waived by the Community Development Director. The purpose of the pre-application conference is to provide an

opportunity for staff to provide the applicant with information on the likely impacts, limitations, requirements, approval standards, fees and other information that may affect the proposal.

1. *To schedule a pre-application conference, the applicant shall contact the Planning Division, submit the required materials, and pay the appropriate conference fee.*
2. *At a minimum, an applicant should submit a short narrative describing the proposal and a proposed site plan, drawn to a scale acceptable to the City, which identifies the proposed land uses, traffic circulation, and public rights-of-way and all other required plans.*
3. *The Planning Division shall provide the applicant(s) with the identity and contact persons for all affected neighborhood associations as well as a written summary of the pre-application conference.*

B. *A pre-application conference shall be valid for a period of six months from the date it is held. If no application is filed within six months of the conference or meeting, the applicant shall schedule and attend another conference before the City will accept a permit application. The Community Development Director may waive the pre-application requirement if, in the Director's opinion, the development has not changed significantly and the applicable municipal code or standards have not been significantly amended. In no case shall a pre-application conference be valid for more than one year.*

C. *Notwithstanding any representations by City staff at a pre-application conference, staff is not authorized to waive any requirements of this code, and any omission or failure by staff to recite to an applicant all relevant applicable land use requirements shall not constitute a waiver by the City of any standard or requirement.*

Finding: Complies Staff held the required pre-application conference meeting (File PA-24-00021), on July 30, 2024. The pre-application conference notes are attached to the application.

17.50.055 - Neighborhood association meeting.

Neighborhood Association Meeting. The purpose of the meeting with the recognized neighborhood association is to inform the affected neighborhood association about the proposed development and to receive the preliminary responses and suggestions from the neighborhood association and the member residents.

A. *Applicants applying for annexations, zone change, comprehensive plan amendments, conditional use, Planning Commission variances, subdivision, or site plan and design review (excluding minor site plan and design review), general development master plans or detailed development plans applications shall schedule and attend a meeting with the City-recognized neighborhood association in whose territory the application is proposed no earlier than one year prior to the date of application. Although not required for other projects than those identified above, a meeting with the neighborhood association is highly recommended.*

B. *The applicant shall request via email or regular mail a request to meet with the neighborhood association chair where the proposed development is located. The notice shall describe the proposed project. A copy of this notice shall also be provided to the chair of the Citizen Involvement Committee.*

C. *A meeting shall be scheduled within thirty days of the date that the notice is sent. A meeting may be scheduled later than thirty days if by mutual agreement of the applicant and the neighborhood association. If the neighborhood association does not want to, or cannot meet within thirty days, the applicant shall host a meeting inviting the neighborhood association, Citizen Involvement Committee, and all property owners within three hundred feet to attend. This meeting shall not begin before six p.m. on a weekday or may be held on*

a weekend and shall occur within the neighborhood association boundaries or at a City facility.

D. If the neighborhood association is not currently recognized by the City, is inactive, or does not exist, the applicant shall request a meeting with the Citizen Involvement Committee.

E. To show compliance with this section, the applicant shall submit a copy of the email or mail notice to the neighborhood association and CIC chair, a sign-in sheet of meeting attendees, and a summary of issues discussed at the meeting. If the applicant held a separately noticed meeting, the applicant shall submit a copy of the meeting flyer, postcard or other correspondence used, and a summary of issues discussed at the meeting and submittal of these materials shall be required for a complete application.

Finding: Complies: As this is a project of citywide importance, Staff presented the McLoughlin Blvd Enhancements Plan and TSP refinements to the Citizen Involvement Committee on November 6, 2023, and October 7, 2024. The city also met with the Two Rivers Neighborhood Association on October 23, 2024.

17.50.070 - Completeness review and one hundred twenty-day rule.

C. Once the Community Development Director determines the application is complete enough to process, or the applicant refuses to submit any more information, the City shall declare the application complete. Pursuant to ORS 227.178, the City will reach a final decision on an application within one hundred twenty calendar days from the date that the application is determined to be or deemed complete unless the applicant agrees to suspend the one hundred twenty calendar day time line or unless State law provides otherwise. The one hundred twenty-day period, however, does not apply in the following situations:

1. Any hearing continuance or other process delay requested by the applicant shall be deemed an extension or waiver, as appropriate, of the one hundred twenty-day period.

2. Any delay in the decision-making process necessitated because the applicant provided an incomplete set of mailing labels for the record property owners within three hundred feet of the subject property shall extend the one hundred twenty-day period for the amount of time required to correct the notice defect.

3. The one hundred twenty-day period does not apply to any application for a permit that is not wholly within the City's authority and control.

4. The one hundred twenty-day period does not apply to any application for an amendment to the City's comprehensive plan or land use regulations nor to any application for a permit, the approval of which depends upon a plan amendment.

D. A one-hundred day period applies in place of the one-hundred-twenty day period for affordable housing projects where:

1. The project includes five or more residential units, including assisted living facilities or group homes;

2. At least 50% of the residential units will be sold or rented to households with incomes equal to or less than 60% of the median family income for Clackamas County or for the state, whichever is greater; and

3. Development is subject to a covenant restricting the owner and successive owner from selling or renting any of the affordable units as housing that is not affordable for a period of 60 years from the date of the certificate of occupancy.

E. The one hundred twenty-day period specified in OCMC 17.50.070.C or D may be extended for a specified period of time at the written request of the applicant. The total of all extensions may not exceed two hundred forty-five calendar days.

F. The approval standards that control the City's review and decision on a complete application are those which were in effect on the date the application was first submitted.

Finding: Complies Legislative actions are not subject to the 120-day deadline.

III. RECOMMENDATION

Based on the findings in this report, staff recommends approval of Planning file GLUA 24-000023**:** LEG-24-00002. If the Planning Commission recommends approval to the City Commission, staff will prepare an Ordinance for consideration by the City Commission to adopt the proposed plan.

Oregon Revised Statute 358.653
Protection of Publicly Owned Historic Properties
Fact Sheet

"Any state agency or political subdivision responsible for real property of historic significance in consultation with the State Historic Preservation Officer shall institute a program to conserve the property and assure that such property shall not be inadvertently transferred, sold, demolished, substantially altered or allowed to deteriorate." ORS 358.653(1)

Summary of ORS 358.653

Oregon Revised Statute (ORS) 358.653, quoted above, is a state law that requires state agencies and political subdivisions of the state (public entities) to conserve "historic properties" and consult with the State Historic Preservation Office (SHPO) to, whenever possible, avoid and minimize negative impacts as a result of project actions. The public entity leads and retains full responsibility for the consultation process and final decision.

- "Political subdivisions" include but are not limited to counties, cities, universities, schools, fire districts, irrigation districts, hospital districts, and local taxing districts.
- The law applies to "real property" owned by the public entity. Buildings and structures are the majority of such properties, though the law also applies to objects and other resources in the project area. These include, but are not limited to, irrigation canals, parks, and monuments.
    - Archaeological sites are subject to additional state and federal laws. If your project involves digging, visit the SHPO's archaeological services info page.

What qualifies as a "historic property?"

A "historic property" is eligible for listing or is already listed in the National Register of Historic Places (National Register). The National Register is maintained by the National Park Service (NPS) and includes buildings, structures, sites, objects, and districts important to local, state, or national history. In general, historic properties are at least 50 years old, retain most of their historic appearance, and meet at least one of the four "criteria for significance." For more information on the National Register criteria, visit the SHPO National Register webpage. The Oregon Historic Sites Database includes all listed properties and previously recorded properties in Oregon Not every historic property has been recorded or is in this database so consultation is important. Information regarding archaeological sites is confidential. For more information regarding archaeological sites within the project area, visit SHPO's archaeological services info page.

What types of projects require review under the law?

The public entity should consult with the Oregon SHPO on any project involving property that, at the time of project completion, is 50 years or older and/or listed in or eligible for listing in the National Register. Oregon SHPO can help to determine if the property is historic. Consultants who meet the Secretary of Interior's Standards for architectural history, historic preservation, or history can also help public entities to determine if their property is historic.

To administer this state law, the Oregon SHPO follows a streamlined version of Section 106 of the National Historic Preservation Act of 1966, as amended (implementing regulations 36 CFR 800), a federal law that considers impacts on historic properties for federal projects. In cases where federal funds, permits, licenses, or land are involved, ORS 358.653 is superseded by Section 106 and the federal agency will consult with the Oregon SHPO.

How does SHPO consultation work?

Consultation is easy and can be accomplished without unnecessary project delays if started early during planning and development. While the public entity is responsible for consultation, the Oregon SHPO recommends the following process:

1. Determine if the real property will be 50 years old or older *by the time of project completion*. If yes, proceed to steps below. If no, then no further action is needed.

   Properties younger than 50 years may be eligible if they have extraordinary significance, characteristics, or historical associations, such as the first of a particular architectural style or the site of an exceptional historic event. Contact the Oregon SHPO for guidance.

2. Gather the necessary materials (historic information, summary of alterations, historic and current photos, maps, etc.) and complete an Oregon SHPO Clearance Form (available on the Review & Compliance page of the SHPO website). Complete the form and determine if the property is listed in or is eligible for listing in the National Register.

3. If the property is historic, determine if the proposed project will negatively affect the historic characteristics of the property. Refer to the Secretary of Interior's Standards, NPS Preservation Briefs, and/or hire a consultant who meets the Secretary of Interior's Standards for architectural history, historic preservation, or history.

4. Submit all materials to the SHPO using the Go Digital process, the electronic submission process for all projects needing SHPO review. The review process takes up to 30 calendar days and will conclude in one of three ways:

   - If the public entity believes the property is not historic and SHPO agrees, or if the public entity believes the property is historic but that the project will not have negative impacts and SHPO agrees, SHPO will provide written correspondence stating their agreement. This ends the process. Local regulations may still apply.

   - If the public entity believes the project will negatively impact the historic property and SHPO agrees, or if the public entity believes there will not be negative impacts and SHPO disagrees, the public entity should seek options to avoid negative impacts. Relatively minor changes can often eliminate negative impacts, preserve the historic property, and avoid mitigation commitments. The SHPO can provide technical resources and historic preservation best practices.

   - If negative impacts cannot be avoided, appropriate mitigation is captured in a Memorandum of Agreement (MOA). Mitigation is determined by the public entity, SHPO, and other consulting parties. Mitigation can take many forms, including but not limited to: documentation, interpretation, public education, protective covenants, or other historic preservation work that provides a public benefit. Please visit the Oregon SHPO webpage for examples of successful mitigation projects.

     The SHPO will provide a template MOA for the public entity to complete. SHPO strongly recommends the public entity conduct community outreach and consult with interested parties on the project's impacts to historic properties. These groups include tribes, Restore Oregon (the statewide preservation non-profit organization), local historic preservation commissions, local historical groups, and members of the public. SHPO can help identify consulting parties, but the public entity is responsible for inviting them to participate and addressing their comments. While neither the public entity nor SHPO must sign the MOA if an agreement cannot be reached, the public entity is responsible for the final decision and documenting the consultation process.

What about local review requirements?

If the historic property is a locally listed landmark or listed in the National Register, it typically falls under the purview of a local landmarks review board. Contact the local planning department to determine if the property is subject to local review.

Additional questions?

Please visit the Oregon SHPO webpage for forms, guidance documents, and contact information.

Oregon's Statewide Planning Goals & Guidelines

GOAL 15: WILLAMETTE RIVER GREENWAY

OAR 660-015-0005

To protect, conserve, enhance and maintain the natural, scenic, historical, agricultural, economic and recreational qualities of lands along the Willamette River as the Willamette River Greenway.

A. GENERAL

1. The qualities of the Willamette River Greenway shall be protected, conserved, enhanced and maintained consistent with the lawful uses present on December 6, 1975. Intensification of uses, changes in use or developments may be permitted after this date only when they are consistent with the Willamette Greenway Statute, this goal, the interim goals in ORS 215.515(1) and the statewide planning goals, as the case may be, and when such changes have been approved as provided in the Preliminary Greenway Plan or similar provisions in the completed plan as appropriate.

2. The Willamette Greenway Program shall be composed of cooperative local and state government plans for the protection, conservation, enhancement and maintenance of the Greenway, and of implementation measures including management through ordinances, rules, regulations, permits, grants as well as acquisition and development of property, etc. It shall also become a part of all other local and state plans and programs within and near the Greenway.

3. The Greenway Program shall include:

a. Boundaries within which special Greenway considerations shall be taken into account;

b. Management of uses on lands within and near the Greenway to maintain the qualities of the Greenway;

c. Acquisition of lands or interests in lands from a donor or willing seller or as otherwise provided by law in areas where the public's need can be met by public ownership.

B. INVENTORIES AND DATA

Information and data shall be collected to determine the nature and extent of the resources, uses and rights associated directly with the Willamette River Greenway. These inventories are for the purpose of determining which lands are suitable or necessary for inclusion within the Willamette River Greenway Boundaries and to develop the plans and management and acquisition programs.

Each of the following items shall be inventoried[1] as it relates to the Greenway objectives:

1. All agricultural lands as provided in Goal 3. This includes all land currently in farm use as defined in ORS Chapter 215.203(2);

2. All current aggregate excavation and processing sites, and all known extractable aggregate sources;

[1] When information on such items is not available through previous studies, information will be maintained by the agencies for those portions of the plan for which they are responsible. This requirement shall not limit units of government from collecting information on other items.

3. All current public recreation sites, including public access points to the river and hunting and fishing areas;

4. Historical and archaeological sites;

5. Timber resources;

6. Significant natural and scenic areas, and vegetative cover;

7. Fish and wildlife habitats;

8. Areas of annual flooding and flood plains;

9. Land currently committed to industrial, commercial and residential uses;

10. The ownership of property, including riparian rights;

11. Hydrological conditions;

12. Ecologically fragile areas;

13. Recreational needs as set forth in Goal 8;

14. Other uses of land and water in or near the Greenway;

15. Acquisition areas which include the identification of areas suitable for protection or preservation through public acquisition of lands or an interest in land. Such acquisition areas shall include the following:

a. Areas which may suitably be protected by scenic easements;

b. Scenic and recreational land for exclusive use of the public;

c. Sites for the preservation and restoration of historic places;

d. Public access corridor;

e. Public parks;

f. Ecologically fragile areas; and

g. Other areas which are desirable for public acquisition may also be identified if the reasons for public acquisition for the Greenway are also identified.

C. CONSIDERATIONS AND REQUIREMENTS

The Oregon Department of Transportation (DOT) Greenway Plan, the portions of each city and county comprehensive plan within the Greenway, and the portions of plans and programs and implementation measures of all special districts, state and federal agencies within the Greenway shall be based on the following factors:

1. **General Considerations and Requirements**

a. Statutory requirements in ORS Chapter 390.010 to 390.220 and in ORS Chapter 390.310 to 390.368;

b. City, county and regional comprehensive plans adopted pursuant to ORS Chapter 197 for jurisdictions along the river;

c. Statewide planning goals and guidelines adopted pursuant to ORS Chapter 197 by LCDC;

d. Interim goals set forth in ORS Chapter 215.515(1).

2. **Boundary Considerations and Requirements**.[2]

The temporary and preliminary Greenway boundaries shall be reviewed as to their appropriateness and refined as needed based on the information contained in the inventories. The refined boundaries shall include such lands along the Willamette River as are necessary to carry out the purpose and intent of the Willamette River Greenway through a coordinated management and acquisition program.

[2] See ORS Chapter 390.318(1) for specific statutory language…"There shall be include within the boundaries of the Willamette River Greenway all lands situation with 150 feet from the ordinary low water line on each side of each channel of the Willamette River and such other lands along the Willamette River as the development of such Greenway; however, the total area included within the boundaries of such Greenway shall not exceed, on the average, 320 acres per river mile along the Willamette River, however, for the purpose of computing the maximum acreage of lands within such Greenway, the acreage of lands situated on such islands and within state parks and recreation areas shall be excluded."

Within farm areas, consideration shall be given to the ability of agricultural land adjacent to the Willamette River Greenway to enhance and protect the Greenway.

3. Use Management Considerations and Requirements. Plans and implementation measures shall provide for the following:

a. **Agricultural lands** -- The agricultural lands identified in the inventory shall be preserved and maintained as provided in Goal 3 as an effective means to carry out the purposes of the Greenway including those agricultural lands near the Greenway. Lands devoted to farm use which are not located in an exclusive farm use zone shall be allowed to continue in such farm use without restriction as provided in ORS 390.314(2)(c), ORS 390.332(4) and ORS 390.334(2);

b. **Recreation** --

(1) Local, regional and state recreational needs shall be provided for consistent with the carrying capacity of the land;

(2) Zoning provisions shall allow recreational uses on lands to the extent that such use would not substantially interfere with the long-term capacity of the land for farm use are defined in ORS 215.203;

(3) The possibility that public recreation use might disturb adjacent property shall be considered and minimized to the greatest extent practicable;

(4) The public parks established by section 8a of Chapter 558, 1973 Oregon Laws, shall be set forth in Oregon Laws, shall be set forth on the appropriate comprehensive plans and zoning established which will permit their development, use and maintenance;

c. **Access** -- Adequate public access to the river shall be provided for, with emphasis on urban and urbanizable areas;

d. **Fish and wildlife habitat** -- Significant fish and wildlife habitats shall be protected;

e. **Scenic qualities and views** -- identified scenic qualities and viewpoints shall be preserved;

f. **Protection and safety** -- The Willamette River Greenway Program shall provide for the maintenance of public safety and protection of public and private property, especially from vandalism and trespass in both rural and urban areas to the maximum extent practicable;

g. **Vegetative fringe** -- The natural vegetative fringe along the River shall be enhanced and protected to the maximum extent practicable;

h. **Timber resource** -- The partial harvest of timber shall be permitted beyond the vegetative fringes in areas not covered by a scenic easement when the harvest is consistent with an approved plan under the Forest Practices Act, or, if not covered by the Forest Practices Act, then with an approved plan under the Greenway compatibility review provisions. Such plan shall insure that the natural scenic qualities of the Greenway will be maintained to the greatest extent practicable or restored within a brief period of time;

i. **Aggregate extraction** -- Extraction of known aggregate deposits may be permitted when compatible with the purposes of the Willamette River Greenway and when economically feasible, subject to compliance with

ORS 541.605 to 541.695; ORS 517.750 to 517.900 and subject to compliance with local regulations designed to minimize adverse effects on water quality, fish and wildlife, vegetation, bank stabilization, streamflow, visual quality, noise, safety and to guarantee necessary reclamation;

j. **Development away from river** -- Developments shall be directed away from the river to the greatest possible degree; provided, however, lands committed to urban uses within the Greenway shall be permitted to continue as urban uses, including port, industrial, commercial and residential uses, uses pertaining to navigational requirements, water and land access needs and related facilities;

k. **Greenway setback** -- A setback line will be established to keep structures separated from the river in order to protect, maintain preserve and enhance the natural, scenic, historic and recreational qualities of the Willamette River Greenway, as identified in the Greenway Inventories. The setback line shall not apply to water-related or water-dependent uses.

4. Areas to be Acquired -- Considerations and Requirements

Areas to be acquired must:

a. Have potential to serve the purposes of the Greenway;

b. To the maximum extent practicable, be consistent with non-interference or non-interruption of farm uses as defined in ORS Chapter 215.203(2);

c. Be suitable for permitting the enforcement of existing statutes relating to trespass and vandalism along the Greenway, and be suitable for allowing maintenance of the lands or interests acquired.

D. DOT GREENWAY PLAN

The DOT will prepare and keep current, through appropriate revisions, a Greenway Plan setting forth the state interests in the Greenway. The plan will show:

1. The boundaries of the Willamette River Greenway;

2. The boundaries of the areas in which interests in property may be acquired. These shall be depicted clearly on maps or photographs together with the nature of the acquisition such as fee title or scenic easement; the general public purposes of each such area, and the conditions under which such acquisition may occur.

3. Use Intensity Classifications for the areas acquired by the State for Greenway purposes; and

4. The locations of public access, either already existing or to be acquired.

The DOT plan or revision thereto will be reviewed by the Land Conservation and Development Commission (LCDC) as provided in ORS 390.322. When the Commission has determined that the revision is consistent with the statutes and this goal it shall approve the plan for recording.

E. COMPREHENSIVE PLANS OF CITIES AND COUNTIES

Each city and county in which the Willamette River Greenway is located, shall incorporate the portions of the approved DOT Greenway Plan in its comprehensive plan and implementing ordinances and other implementation measures.

1. **Boundaries**: Boundaries of the approved Willamette River Greenway shall be shown on every comprehensive plan.

2. **Uses**: Each comprehensive plan shall designate the uses to be permitted for the rural and urban areas of each jurisdiction, which uses shall be consistent with the approved DOT Greenway Plan, the Greenway Statutes and this Goal.

3. **Acquisition Areas**: Each comprehensive plan shall designate areas identified for possible public acquisition and the conditions under which such acquisition may occur as set forth in the approved DOT Willamette Greenway Plan and any other area which the city or county intends to acquire.

F. IMPLEMENTATION MEASURES

Implementation of the Greenway Program shall occur through the cooperative efforts of state and local units of government and shall be consistent with the approved DOT Greenway Plan and the city and county comprehensive plans, the goals and appropriate statutes.

1. **Boundaries**: Willamette River Greenway boundaries shall be shown on city and county zoning maps and referred to in the zoning ordinance and the subdivision ordinance.

2. **Uses**: Measures for managing uses within the Greenway shall include at least:

a. Exclusive farm use zoning of all agricultural land within and adjacent to the Greenway;

b. Flood plain zoning of all areas subject to flooding;

c. Open space zoning (see ORS Chapter 308.740) of all open space areas; and

d. Provisions for the use management considerations and requirements set forth in C3 of this Goal.

3. **Greenway Compatibility Review**: Cities and counties shall establish provisions by ordinance for the review of intensifications, changes of use or developments to insure their compatibility with the Willamette River Greenway. Such ordinances shall include the matters in ***a*** through ***e*** below:

a. The establishment of Greenway compatibility review boundaries adjacent to the river within which review of developments shall take place. Such boundaries in urban areas shall be not less than 150 feet from the ordinary low water line of the Willamette River; in rural areas such boundaries shall include all lands within the boundaries of the Willamette River Greenway;

b. The review of intensification, changes of use and developments as authorized by the Comprehensive Plan and zoning ordinance to insure their compatibility with the Greenway statutes and to insure that the best possible appearance, landscaping and public access are provided. Such review shall include the following findings, that to the greatest possible degree:

(1) The intensification, change of use or development will provide the maximum possible landscaped area, open space or vegetation between the activity and the river;

(2) Necessary public access will be provided to and along the river by appropriate legal means;

c. Provision is made for at least one public hearing on each application to allow any interested person an opportunity to speak;

d. Provision is made for giving notice of such hearing at least to owners of record of contiguous property and to

any individual or groups requesting notice; and

e. Provision is made to allow the imposing of conditions on the permit to carry out the purpose and intent of the Willamette River Greenway Statutes.

f. As an alternative to the review procedures in subparagraphs 3(a) to 3(e), a city or county governing body may prepare and adopt, after public hearing and notice thereof to DOT, a design plan and administrative review procedure for a portion of the Greenway. Such design plan must provide for findings equivalent to those required in subparagraphs 3(b)(1) and (2) of paragraph F so as to insure compatibility with the Greenway of proposed intensification, changes of use or developments. If this alternative procedure is adopted and approved by DOT and LCDC, a hearing will not be required on each individual application.

G. NOTICE OF PROPOSED INTENSIFICATION, CHANGE OF USE OR DEVELOPMENT

Government agencies, including cities, counties, state agencies, federal agencies, special districts, etc., shall not authorize or allow intensification, change of use or development on lands within the boundaries of the Willamette River Greenway compatibility review area established by cities and counties as required by paragraph F 3.a. without first giving written notice to the DOT by immediately forwarding a copy of any application by certified mail--return receipt requested. Notice of the action taken by federal, state, city, county, and special districts on an application shall be furnished to DOT.

H. AGENCY JURISDICTION

Nothing in this order is intended to interfere with the duties, powers and responsibilities vested by statute in agencies to control or regulate activities on lands or waters within the boundaries of the Greenway so long as the exercise of the authority is consistent with the legislative policy set forth in ORS 390.310 to 390.368 and the applicable statewide planning goal for the Willamette River Greenway, as the case may be. An agency receiving an application for a permit to conduct an activity on lands or waters within the Greenway shall immediately forward a copy of such request to the Department of Transportation.

I. DOT SCENIC EASEMENTS

Nothing in this Goal is intended to alter the authority of DOT to acquire property or a scenic easement therein as set forth in ORS 390.310 to 390.368.

J. TRESPASS BY PUBLIC

Nothing in this Goal is intended to authorize public use of private property. Public use of private property is a trespass unless appropriate easements and access have been acquired in allowance with law to authorize such use.

K. DEFINITIONS FOR WILLAMETTE RIVER GREENWAY GOAL

1. ***Change of Use*** means making a different use of the land or water than that which existed on December 6, 1975. It includes a change which requires construction, alterations of the land, water or other areas outside of existing buildings or structures and which substantially alters or affects the land or water. It does not include a change of use of a building or other structure which does not substantially

alter or affect the land or water upon which it is situated. Change of use shall not include the completion of a structure for which a valid permit had been issued as of December 6, 1975 and under which permit substantial construction has been undertaken by July 1, 1976. The sale of property is not in itself considered to be a change of use. An existing open storage area shall be considered to be the same as a building.

Landscaping, construction of driveways, modifications of existing structures, or the construction or placement of such subsidiary structures or facilities as are usual and necessary to the use and enjoyment of existing improvements shall not be considered a change of use for the purposes of this Goal.

2. ***Lands Committed to Urban Use*** means those lands upon which the economic, developmental and locational factors have, when considered together, made the use of the property for other than urban purposes inappropriate. Economic,developmental and locational factors include such matters as ports, industrial, commercial, residential or recreational uses of property; the effect these existing uses have on properties in their vicinity, previous public decisions regarding the land in question, as contained in ordinances and such plans as the Lower Willamette River Management Plan, the city or county comprehensive plans and similar public actions.

3. ***Intensification*** means any additions which increase or expand the area or amount of an existing use, or the level of activity. Remodeling of the exterior of a structure not excluded below is an intensification when it will substantially alter the appearance of the structure. Intensification shall not include the completion of a structure for which a valid permit was issued as of December 6, 1975 and under which permit substantial construction has been undertaken by July 1, 1976. Maintenance and repair usual and necessary for the continuance of an existing use is not an intensification of use. Reasonable emergency procedures necessary for the safety or the protection of property are not an intensification of use. Residential use of lands within the Greenway includes the practices and activities customarily related to the use and enjoyment of one's home. Landscaping, construction of driveways, modification of existing structures or construction or placement of such subsidiary structures or facilities adjacent to the residence as are usual and necessary to such use and enjoyment shall not be considered an intensification for the purposes of this Goal. Seasonal increases in gravel operations shall not be considered an intensification of use.

REVISED TYPE III STAFF RECOMMENDATION
April 6, 2026

MASTER PLAN (GDP) FRAMEWORK PLAN, PARKING ADJUSTMENT, AND CONDITIONAL USE FOR DRIVE THRU LOCATIONS

FILE NUMBER: **GLUA-25-00025**: **CU-25-00001, MAS-25-00001, PARK-25-00001**

REVIEWER: Christina Robertson-Gardiner, Senior Planner AICP
Erik Nichols, Project Engineer

ZONING: Mixed Use Corridor (MUC-2)

DECISION: Approval with Conditions

PROCESS: Type III decisions involve the greatest amount of discretion and evaluation of subjective approval standards, yet are not required to be heard by the city commission, except upon appeal. Applications evaluated through this process include conditional use permits. The process for these land use decisions is controlled by ORS 197.763. Notice of the application and the planning commission hearing is published and mailed to the applicant, recognized neighborhood association and property owners within three hundred feet of the subject property. Notice must be issued at least twenty days pre-hearing, and the staff report must be available at least seven days pre-hearing. At the evidentiary hearing held before the planning commission, all issues are addressed. The decision is final unless appealed and description of the requirements for perfecting an appeal. The decision of the planning commission is appealable to the city commission within fourteen days of the issuance of the final decision. The city commission hearing on appeal is on the record and no new evidence shall be allowed. Only those persons or a city-recognized neighborhood association who have participated either orally or in writing have standing to appeal the decision of the planning commission. Grounds for appeal are limited to those issues raised either orally or in writing before the close of the public record. A city-recognized neighborhood association requesting an appeal fee waiver pursuant to OCMC 17.50.290.C must officially approve the request through a vote of its general membership or board at a duly announced meeting prior to the filing of an appeal. The city commission decision on appeal from the planning commission is the city's final decision and is appealable to the Land Use Board of Appeals (LUBA) within twenty-one days of when it becomes final.

CHAPTERS

CHAPTER 17.29 MUC MIXED USE CORRIDOR DISTRICT
CHAPTER 17.50 ADMINISTRATION AND PROCEDURES
CHAPTER 17.56 CONDITIONAL USES
CHAPTER 17.52 OFF-STREET PARKING AND LOADING
CHAPTER 17.65 MASTER PLANS AND PLANNED UNIT DEVELOPMENTS

Staff Summary
The following is an executive summary of the major elements of the Master Plan. Additional findings and background are found throughout the document.

The Applicant is proposing a Master Plan to create future development parcels for a site zoned Mixed Use Corridor 2. Once approved, each parcel will be submitted for a separate Type II Administrative Detailed Development Plan (DDP) Review when market conditions are ready for each development. The buildings and their locations on the three development parcels are subject to change unless otherwise specified by condition in this application.

While the applicant could have created the development parcels and built the public road through an Administrative Type II Site Plan design review, the Master Plan process will provide the applicant with the needed clarity for phasing and site-wide impact analysis, and ensure that the same code is used for review at the time of each Detailed Development (DDP) application. Staff has found that, as conditioned, the application meets all relevant Master Plan transportation and utility impact review criteria.

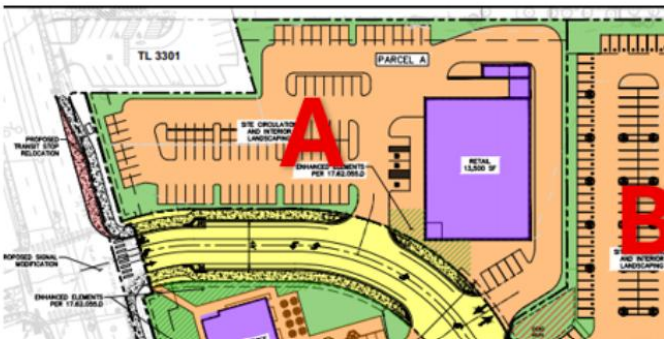
Two requests in the proposal specifically require Planning Commission review: drive-through facilities and adjustments to the parking maximums for parcels A and D. Staff has found that both requests are reasonable, well-designed, and can meet the criteria for approval with the enclosed conditions.

The Planning Commission should focus its deliberation on these two questions:

1. Has the applicant adequately demonstrated a need for an adjustment to the maximum parking standard on parcels A and D, and have any adverse effects been mitigated?
2. Has the applicant designed drive-through facilities on Parcels A and D that are safe, contain adequate queue storage, and have any adverse effects been mitigated?

A Detailed Development Plan for the construction of a new public road and utilities has been submitted (MAS-25-002_GEO-25-007_NROD-25-012) concurrently with the Master Plan. The staff report will be part of the Planning Commission hearing and can be approved at the same time as the Master Plan.

Summary of Master Plan Elements



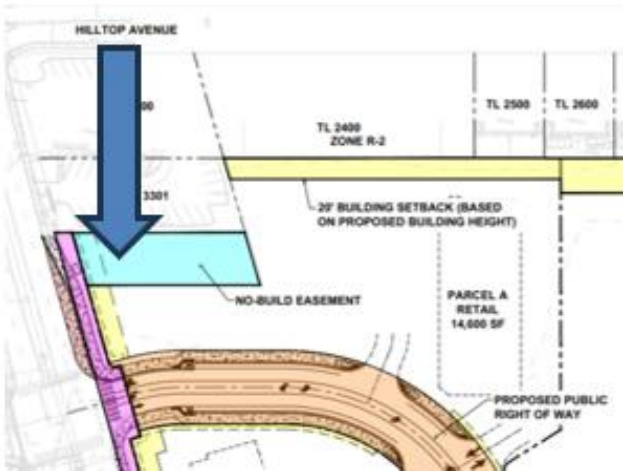
- Creation of 4 development parcels
    - Parcel A: Retail,
    - Parcel B: Multi-Family,
    - Parcel C: New Public Road (including frontage improvements on Molalla Avenue)
    - Parcel D: Quick Serve Restaurant
- Review of Transportation Impact Analysis for the full site
- Review of public road and utility location, site grading.
- Conditional Use Review for two drive-thru facilities (Parcels A and D)
- Parking Maximum Adjustment (Parcels A and D)
- Clarifying Future DDP process for parcel building out
    - 20-year Master Plan (TLs 3330,3400,3200,3201)
    - Can use the code effective at the time of Master Plan submittal, or the current code at the time of DD submittal, for each parcel.
    - Specific uses are not tied to the Master Plan Approval, but any revision must be reviewed to see if it affects any Master Plan conditions of approval.

- No Master Plan adjustments are being requested. Each DDP must meet the Type II development process or return to the Planning Commission for a Master Plan adjustment request.

Parcel A Redesign

The applicant initially proposed a small specialty grocer for Parcel A. However, as they were submitting the full application, the tenant of Parcel A withdrew, forcing the applicant to quickly reformat the approach to Parcel A.

Luckily, the existing building's size and location allowed for a conversion into a multi-tenant commercial space without a major redesign. The planned loading and unloading area for the grocery store could easily be adapted into a drive-thru queue space for a restaurant tenant at the back of the building. The submitted application features this redesign and requests a drive-thru facility on Parcel A.



Previous Design- Specialty Grocer

Revised Design- Multi-Tenant Commercial

No Build Easement

At first, the applicant explored placing the revised building at the corner of Molalla Avenue and the new road, but discovered that a no-build easement heavily restricted this area and limited space for drive-thru queues and direct access to parking. Staff believes that the design is a reasonable approach for the lot, and since no tenants have been identified for this parcel, a parking maximum for **use** is not warranted. Instead, staff views the approach as allowing additional parking in the no-build/constrained area of the parcel, subject to enhanced landscaping (Condition of Approval; #14) along Molalla Avenue, which will require removing 7-8 parking spaces along the Molalla Avenue frontage. The new building on Parcel A fronts directly onto the new road and will feature a direct pedestrian connection. The transportation analyses reviewed both the impact of the specialty grocery and the multi-tenant commercial, and both met the city's operational standards as conditioned. If, after the Master Plan is approved, a specialty grocery returns to Parcel A, it can still be implemented through the Type II DDP process and does not require a Type III Amendment to the Master Plan.

Parcel C – Public Road
A new public road is being proposed to connect the site to both Molalla Avenue and Beavercreek Road with signalized intersections. This road has been included in the city's Transportation System Plan (TSP). The properties adjacent to Beavercreek Road are part of the initial Master Plan (Fig. 6) to allow for road construction, but are not included in the 20-year extension. The owners of these lots (tax lots 500, 501, and 602) have a private easement indicating that the lots involved in the full master plan will develop the road for them. Once constructed, tax lots 500, 501, and 602, which front Beavercreek Road, will no longer be subject to the Master Plan and may be developed through the standard Site Plan and Design Review Process when market conditions are ready. The Detailed Development Plan review for this road is documented in the separate staff report MAS-25-002_GEO-25-007_NROD-25-012.

Transportation Analysis
Staff finds that the applicant has demonstrated that the proposal provides a safe buildout scenario, that the transportation impacts have been assessed in accordance with the city-adopted transportation impact guidelines, and that adequate conditions can be met to ensure compliance. Transportation System Development Fees (SDC), which support the construction of projects identified in the city's Transportation System Plan (TSP), will be paid at the time of each detailed development plan, including a proportional share of the planned improvements at OR-213/Beavercreek Road for a new dedicated right turn lane from Beavercreek. The shared use path project, S28, may be built with the DDP for Parcel C in total or in part as part of Parcel C boundary only and a future DDP in Parcel B. Frontage improvements to Molalla Avenue may be built with each DDP or Parcel C only.

Conditional Use Review for Two Drive-Thru Facilities (Parcels A and D)
Compared to the neighboring General Commercial District, the Mixed-use Corridor zone requires Planning Commission review for drive-through facilities. The Planning Commission can consider each development separately, conduct a context-sensitive review, and place reasonable conditions on the proposal. Staff notes that the two drive-through facility locations have been thoughtfully designed to ensure safety and prevent queues from blocking public roads. The associated uses are permitted in the zone; the drive-throughs are located on the side and rear; and the buildings are not exclusively dedicated to drive-through traffic. The applicant has also

proposed additional landscaping along Molalla Avenue to enhance the pedestrian experience for Parcel D, and staff has conditioned additional landscaping on Parcel A and D, which staff believes will improve the area and mitigate any potential visual impacts from the drive-through proposal. An opening-day pedestrian and vehicle circulation safety plan for Parcel D has been added as a condition, given that the early months of operation will be busy.

Parking Maximum Adjustment (Parcels A and D)
Parking Adjustments are identified as a Type III Planning Commission review, as the city's urban form varies greatly from the urban downtown core to the more suburban Hilltop areas. A public hearing allows the Planning Commission to consider a proposal in context with abutting neighbors and the vision for development in the surrounding area. Because the new public road separates Parcels A and D, a shared parking approach is unlikely and impractical. If both parcels were on the same side of the street, staff would be more open to pursuing shared parking and opposing the maximum parking adjustment of parking. Allowing an increase in the maximum parking for Parcel D ensures sufficient customer parking for higher-traffic restaurants that lack a larger street connection to the neighborhood, which do not have abundant on-street parking, nor do they have access rights for customers to use nearby commercial development for parking.

When Parcel A was initially proposed as a small specialty grocery, it made sense to ensure that the maximum number of spaces was allowed on-site. With Parcel A being redesigned as a mix of tenants to be determined, the request for a maximum of 102 spaces on Parcel A does not seem as critical. Parcel A is constrained by a non-build easement on a portion of the Molalla Avenue easement, which makes placing the building at the corner of the new public street at Molalla Avenue problematic.

The proposed building location on Parcel A fronts the new public road and offers direct access, but it is more than 25 feet away from the intersection at Molla Avenue. A condition of approval has been added allowing the building on Parcel A to be positioned as proposed, contingent on adding an enhanced landscaping strip along Molalla Avenue. This will remove the Molalla Avenue frontage from Parcel A, no longer making it a corner lot, either through the creation of a tract or recording a specific easement. The improved landscaping on Parcel A will match the upgraded landscaping planned for Parcel D, ensuring a smoother transition along Molalla Avenue and serving as a gateway to the development, which helps reduce potential negative effects on pedestrians. Fully denying the parking maximum request will leave part of the lot unbuilt and available for future development; however, it remains unclear whether a large private, landscaped area near Molalla Avenue would offer any clear community benefits beyond the already conditioned enhanced landscaping strip.

If the applicant provides additional findings demonstrating that the full 102 parking spaces are needed for Parcel A, the Planning Commission can choose to remove the enhanced landscaping condition and direct staff to provide additional findings and conditions showing that there is adequate mitigation for the proposed parking adjustment.

Conditions of Approval

(P) = Verify that condition of approval has been met with the Planning Division.
(DS) = Verify that condition of approval has been met with the Development Services Division.
(B) = Verify that condition of approval has been met with the Building Division.
(F) = Verify that condition of approval has been met with Clackamas Fire Department.

1. Per OCMC 17.65.020.A, unless further amended and extended by the Planning Commission, this Master Plan, which includes Tax Lots 3330, 3400, 3200, and 3201, shall control development on the site until March 23, 2046. Tax Lots 500, 501, and 602 are not part of the 20-year Master Plan but are included initially to allow for the DDP construction of the Public Road, which will connect with Beavercreek Road. Future DDP applications are to be processed as Type I or II review as directed by the Oregon City Municipal Code, and the applicant may choose to use either the 2025 code adopted at the time of the Master Plan Amendment submittal (June 27, 2025) or the current code. (P)
2. The applicant's proposed building layouts and sizes are subject to change during the DDP process and should not be viewed as amendments to the Master Plan unless the final size or scope of the buildings surpasses what was initially proposed or is limited by additional conditions specified in the Master Plan. The final design will be assessed during the Type II Detailed Development Plan review. This means the applicant can build a smaller development or a proposal with fewer trips, as long as the design fulfills the approval criteria of the Detailed Development Plan and the relevant Master Plan conditions. (P)
3. The project's overall floor area ratio (FAR) is 0.73, exceeding the minimum requirement for this zone. For each DDP application, the applicant shall indicate how the proposal will meet or exceed the zone's minimum FAR of 0.25 for the whole site (parcels A, B & D). (P)
4. The applicant shall ensure that the following Master Plan residential standards found in OCMC 17.65.050C (8) & (9) are met at the time of Detailed Development Review of Parcel B.(P)
5. The findings of the City's review of the TIA show that the proposed development does not fail the City's transportation systems and that the overall concept of the proposed development can meet the City's standards. Additional reviews and conditions will be required for each DDP, tailored to each parcel (e.g., driveway locations, spacing, sizing, queuing).
    a. The proposed public street between Molalla Avenue and Beavercreek Road shall be constructed prior to occupancy of the first developed parcel and follow standards within OCMC 17.44. (DS)
    b. The construction of the shared-use path S28 within TL 3200/3400 may be completed with either the DDP for the new roadway in total or in part with Parcel C and completing within the DDP of Parcel B prior to occupancy of Parcel B and follow standards of OCMC 17.44. (DS)
    c. Since the TIA assumes a reduction in vehicle trips due to internal trip capture that would occur as walking and/or biking trips, the TIA shall be revised to discuss the project's internal pedestrian and bicycle circulation needs and how the site plan adequately accommodates active modes. (DS)

d. Minimum AASHTO sight distance requirements shall be met at all site intersections and driveways. Sight distances on the internal local street system shall be approved by the City Engineer prior to final site plan approval (at DDP). (DS)
e. A proportionate share fee contribution of $404 per p.m. peak hour trip shall be collected for planned improvements at OR-213/Beavercreek Road. The fee amount will be determined as part of future detailed development plan applications. (DS)
f. The opening months of the quick service restaurant on Parcel D will be busier than the proposed and reviewed long-term operational impact. At the time of the DDP review, the applicant will be required to implement an on-site and off-site opening-day pedestrian and vehicular circulation and safety plan.to address additional traffic congestion and concerns regarding vehicle queuing.

6. The proposed 12" water main, connecting Molalla Avenue to Beavercreek Road, shall be constructed with the new public road street improvements. (DS)
7. The City's identified sanitary extension within Parcel B shall be completed prior to Parcel B's occupancy. The proposed sewer line within the new public road shall be constructed with the new public road improvements. (DS)
8. Public stormwater facilities shall only treat stormwater from publicly maintained rights-of-way (i.e. public streets). The applicant shall either separate the public stormwater runoff from the private runoff with separate publicly maintained facilities (e.g. streetside planters or other separate facilities) and privately maintain facilities for private stormwater runoff; or the development can enter into an agreement with the City to privately maintain a combined pond. Stormwater associated with the new public road shall be constructed with the new public road improvements. All stormwater improvements shall comply with OCMC 17.44 for each DDP. (DS)
9. Grading and erosion control permitting will be required for all construction activities meeting the thresholds and standards noted in the City's Stormwater and Grading Design Standards, OCMC 15.48, and OCMC 17.47. Grading within the City's Geological Hazards Overlay Zone shall comply with OCMC 17.44 for each DDP. If the applicant wishes to grade or prepare Parcel's A, B, and D prior to the future development's DDPs, a grading and erosion control permit is required. If the applicant chooses to complete mass grading prior to permit of final engineering plans of the new public road, a separate grading permit and mass grading plan will be required. (DS)
10. The applicant will be required to meet the conditions of approval for OCMC 17.44 within the Geological Hazards Overlay Zone as part of each DDP within the mapped Geological Hazards Overlay Zone. (DS)
11. Parcel B's future DDP application shall be required to make significant changes to its site plan in order to meet the City's Geological Hazard Code 17.44 within the mapped landslide and steep slope areas within the Geologic Hazards Overlay Zone for allowable earth disturbance and dwelling unit density. (DS)
12. The proposed public improvements identified with this GDP are generally consistent with the City's water, sewer, stormwater, and transportation standards. Further refinement to these facilities will be conditioned and reviewed as part of each parcel's DDP to ensure that they meet City standards and design policies. (DS)
13. The proposed drive-thru facility Conditional Use Permits on Parcels A and D are approved. As the applicant has provided enhanced landscaping, extensive on-site queue storage, and demonstrated that car stacking will not impact the operation of any public roads, no time

limit for periodic review has been established. Additionally, the drive-thru facility on Parcel A may be used by one or more tenants if, through the Detailed Development Review Process, it can be demonstrated that there is adequate queue storage for an additional tenant. However, if the city finds that one or more conditions attached to the grant of the conditional use permit have not been fulfilled, and the unfulfilled condition is substantially related to the issuance of the permit, the city may pursue the revocation of the conditional use permit through 17.56.060 - Revocation of conditional use permits. (P)

14. The Parking Maximum Adjustment is approved for Parcels A and D, subject to enhanced landscaping along Molalla Avenue, as further defined in Condition of Approval #15. (P)

15. Two enhanced landscaping locations are required to be installed before receiving a Certificate of Occupancy for their respective parcels. The enhanced landscaping on Parcels A and D is shown in Figures 8 and 9 of the staff report. The following enhanced landscaping areas (both proposed and conditioned) shall meet the landscaping standards of OCMCM 17.62.050, can be included in the minimum landscaping requirements of the parcel, and include the following elements:

    a. Native trees and shrubs are required to be planted at a rate of two trees and thirty shrubs per 1,000 square feet of enhanced landscape area. Fractions thereof of trees/plants shall be rounded down. The trees do not need to be evenly spaced, and 1/2 of them must meet a minimum of 45 feet at full height. Oregon White Oaks are encouraged where applicable and represent at least five of the required trees in the combined parcel areas A and D areas.
    b. Plant Diversity. Shrubs shall consist of at least four different species on each parcel. If fifteen trees or more are planted on each parcel's enhancement landscaping area, no more than one-third of the trees may be of the same genus. Up to twenty-five percent of the shrub plantings do not need to be native shrubs. (P)

16. Parcel A is not designed to be a corner lot because of the non-build easement on a substantial portion of the Molalla Avenue frontage. At the time of the DDP for Parcel A, the applicant shall ensure the enhanced landscaping areas further described in Condition of Approval #14 are part of a separate landscape tract or specified landscape easement, which can be removed upon redevelopment. Monument signs are allowed within this tract or easement. (P)

17. The proposed location of the shared use path (S28) is located below the development on Parcel B in a narrow bench of the hillside that is not visible to the general public which will, as designed and built, create an attractive nuisance and public safety concerns and conflicts with the community's comprehensive plan policies to support design that is to strengthen wellbeing, quality of life, and livability across all Oregon City neighborhoods by creating places that are safe and comfortable with convenient access to community services. The applicant shall resubmit a revised design at the time of DDP development for either Parcel C or Parcel B. The revised design of S28 requires a minimum paved 7-foot-wide path that is ADA accessible, lit to the standards of 16.12.032.D, at a similar grade and visible from the development on Parcel B, and designed to connect to the northern property line, which will be extended at a future time to Hilltop Avenue. (DS)

18. The Master Plan parcels may be separated and or sold as part of the Master Plan implementation, which does not remove those parcels from the 20-year Master Plan unless an amendment to the boundary is requested. (P)

I. BACKGROUND:

1. Existing Conditions

The subject property is comprised of an assemblage of properties in the main development area, which includes TL 3200, 3201, 3300, & 3400, Map 3 2E 05DB (On-Site) and a proposed public road through TL 500 & 501, Map 3 2E 05D (Off-site) that connects the on-site properties to Beavercreek Rd. The on-site properties are currently vacant and include a mixture of grasslands, scrub brush, and scattered groves of trees, with more concentrated tree canopy along the north and south edges and in the southeast corner. The east side of the on-site properties extends into Newell Creek Canyon, is heavily forested, and lies within a geologic hazard area.

Past uses on TL 3200, 3201, and 3300 include a former wrecking yard whose operations started in 1953 and continued until late 2001, when the wrecking yard operations ceased. Environmental studies on these properties indicated low concentrations of petroleum hydrocarbons and/or metals in near-surface and shallow soils, and that groundwater underlying the former wrecking yard was not impacted with contaminants of concern. TL 3400 previously included a gas station and tavern in the vicinity of its southwest corner, which has been removed. Environmental remediation occurred at the former gas station site, and ODEQ issued a “No Further Action” letter indicating that ODEQ should be notified prior to installation of any groundwater supply wells and any construction or excavation in or around the former gas station pocket of contamination.

The on-site properties generally slope to the south, with a portion of the west end of the site sloping to the southwest. The east end of the property includes a steep slope extending into Newell Creek Canyon and is heavily forested.

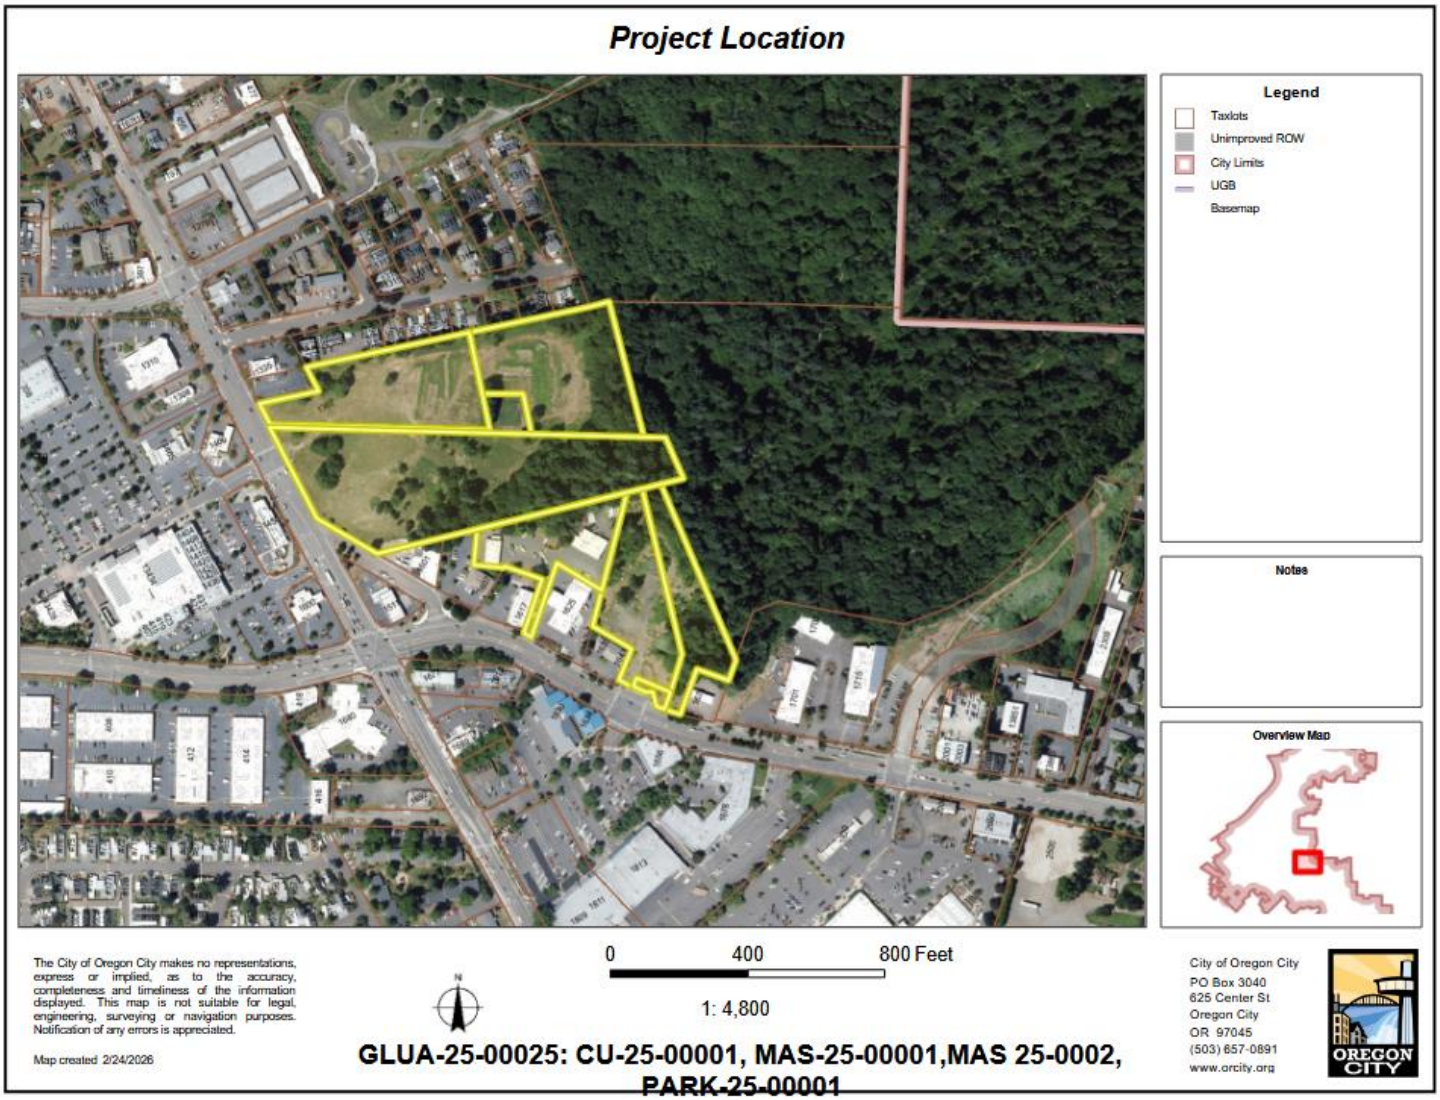


Figure 1. Vicinity Map & Existing Conditions – Aerial Image

Figure 2: Street View from Molalla Avenue

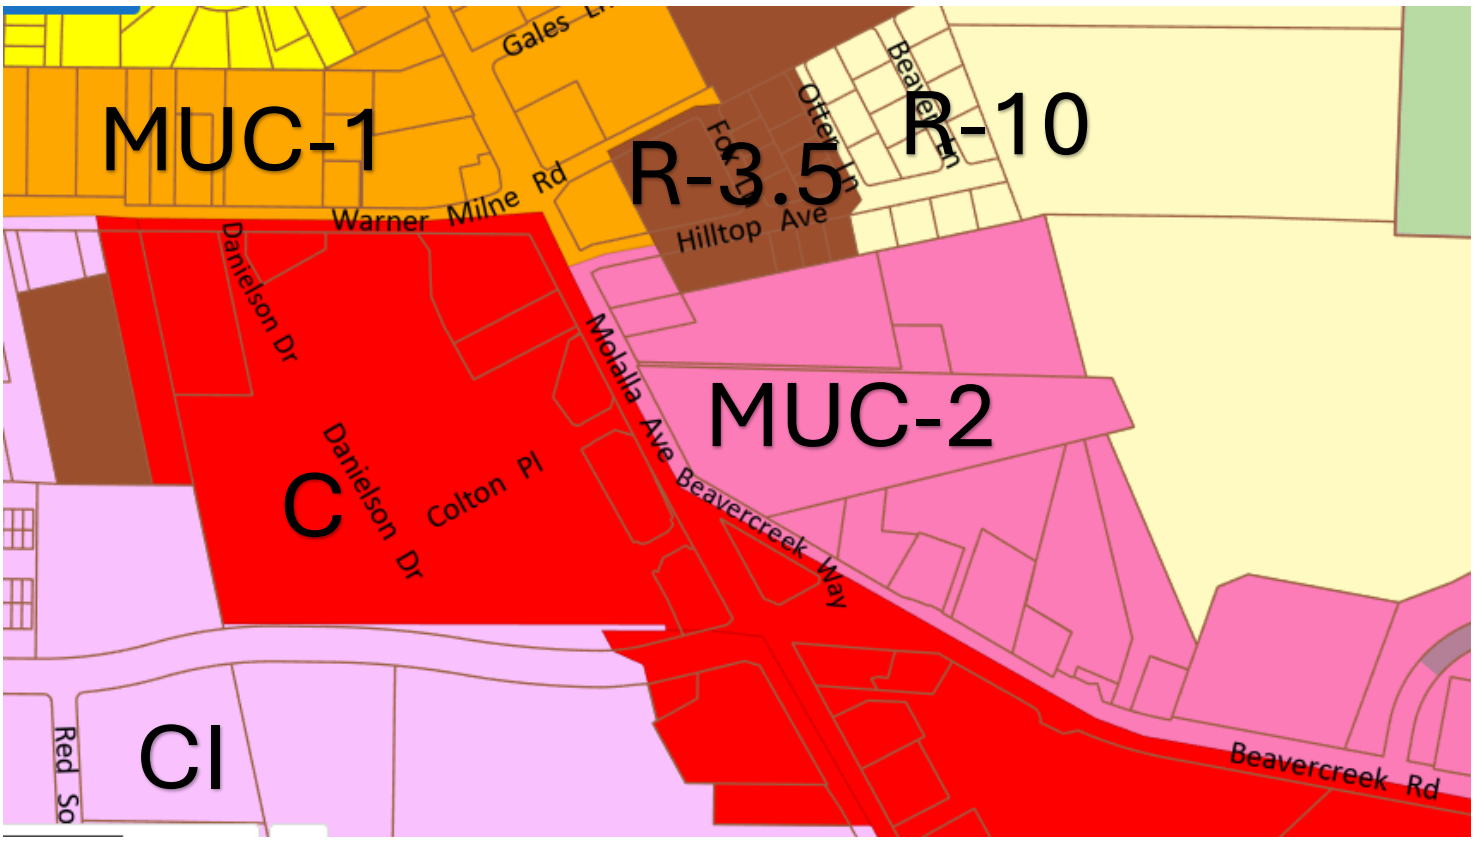

Figure 3. Adjacent Zoning. Mixed Use Corridor (MUC-1) and (MUC-2), Low Density Residential R-10, Medium Density Residential R3.5, Campus Industrial CI, General Commercial-C.

2. Project Description

The project proposes to develop the on-site properties into a mixed-use development via the Oregon City Masterplan process. Three parcels are proposed in addition to a public street extending from the existing signal at Molalla Ave through the on-site properties and through TL 500/501 to the existing signal at Beavercreek Rd. Uses on the parcels include an approximately 13,500 sf retail building on Parcel A, an approximately 208-unit multi-family residential component on Parcel B, and a Quick Service Restaurant on Parcel D. Parcel C is proposed as a public road through the site. The Quick Service Restaurant and retail building in Parcel A include a drive-through facility, which requires Conditional Use Approval.

Parcels A and D will also seek an adjustment to the maximum parking ratio. The project seeks Type III Masterplan General Development Plan approval and Type II Detailed Development Plan approval for the proposed public roadway and utility improvements in both on- and off-site areas, and for rough grading of the entire on-site area.

Overall phasing on the Masterplan includes the proposed public roadway and utility improvements, as phasing approach to grading.

The remaining parcels are proposed as separate phases, though their development will be market-driven and could be developed separately or simultaneously with each other

Summary of Master Plan Elements (GDP)

- Creation of 4 development parcels
  - Parcel A: Retail,
  - Parcel B: Multi-Family,
  - Parcel C: New Public Road,
  - Parcel D: Quick Serve Restaurant
- Review of Transportation Impact Analysis for the full site
- Review of public road and utility location, site grading.
- Conditional Use Review for two drive-thru facilities (Parcels A and D)
- Parking Maximum Adjustment (Parcels A and D)
- Clarifying Future DDP process for parcel building out
  - 20-year Master Plan (TLs 3330,3400,3200,3201)
  - Can use the code effective at the time of Master Plan submittal, or the current code at the time of DD submittal, for each parcel
  - Specific uses are not tied to the Master Plan Approval, but any revision must be reviewed to see if it affects any Master Plan conditions of approval.
  - No Master Plan adjustments are being requested. Each DDP must meet the Type II development process or return to the Planning Commission for a Master Plan adjustment request.

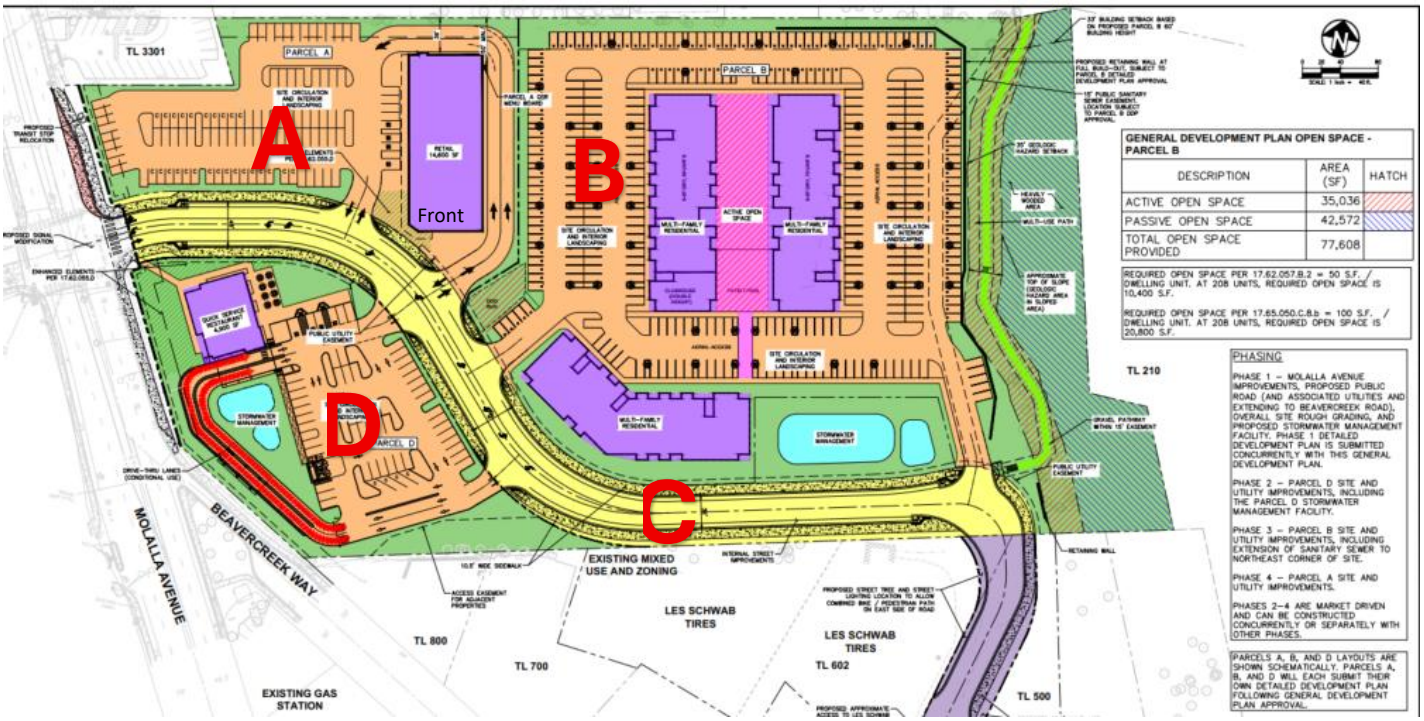

Figure 4: Proposed Master Plan **Parcel A**: Retail**, Parcel B**: Multi-Family, **Parcel C**: New Public Road, **Parcel D:** Quick Serve Restaurant

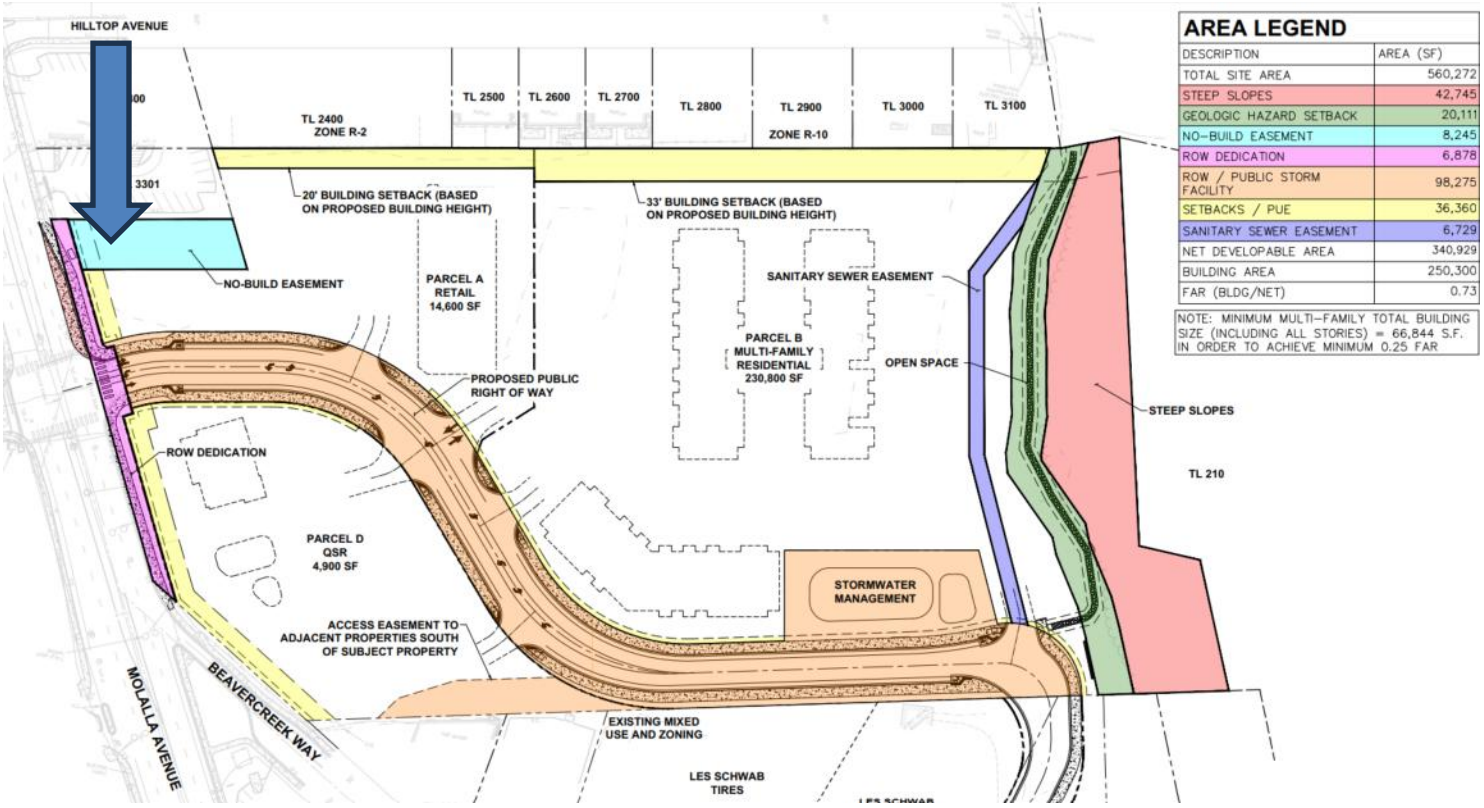

Figure 5: Site Setbacks and Constraints (note the no-build easement in blue on Parcel A)

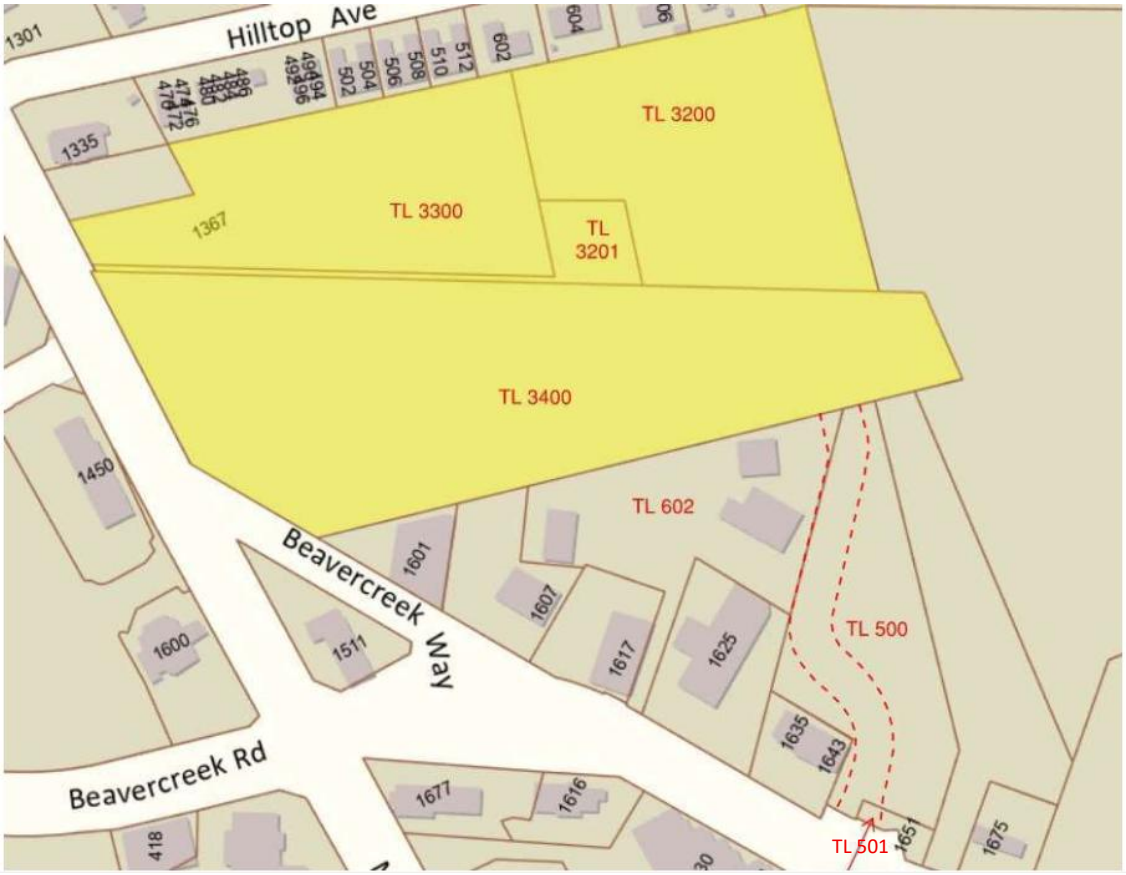

Figure 6: Associated Tax Lots-Tax Lots 500, 501and 602 are not part of the 20-year Master Plan but are included initially to allow for the DDP construction of the Public Road, which will connect with Beavercreek Road.

3. **Permits and Approvals:** The applicant is responsible for obtaining approval and permits from each applicable governmental agency and department in Oregon City, including but not limited to the Engineering and Building Divisions.

4. **Public Comment**
   Public comments submitted include (Exhibit 3):

   Rocky Younger - Mr. Younger owns tax lots 500 and 501, which are part of the application for the purpose of building the Parcel C Road to the intersection of Beavercreek Road. Once completed, it will not be part of the 20-year Master Plan. A private easement was recorded, which requires the owner of the Master Plan lots to build out the full road for tax lots 500 and 501. The city is not a party to the easement, and it is not part of any city review criteria. Mr. Younger is tracking the land use review to ensure that the easement language is being fulfilled by the city's staff report and conditions. He has submitted the private easement to the record with this comment.

Metro - On March 20 and March 23, the City received testimony from Metro expressing concerns about how this development would impact Metro's Newell Creek Canyon Nature Park and Natural Area located on Tax Lot 210, east of the subject development.

Metro's Easement

Metro has expressed concerns that the proposed development adversely impacts Metro's access to its TL 210 which it claims is guaranteed by a private easement. The City's role here is not to interpret or protect easement rights between private property owners. Rather, its sole role is to review applications for compliance with the applicable approval criteria. No law or other criterion demands that the City guarantee this privately negotiated access.

That said, nothing in this approval shall preclude Metro from obtaining access to its TL 210, Metro Newell Creek Canyon Nature Park. This access may occur upon the public road proposed on TL 500 or include the provision of any stubbed improvements at the northeast corning of TL 500 as necessary to accommodate gated access. The owner of TL 500 is encouraged to seek and obtain a driveway access permit allowing for gated access to TL 210 as may be required to fulfill any easement obligations it may have.

Location of Shared Use Path

Approval of a general development plan requires a finding that the application is in compliance with the Oregon City Comprehensive Plan. OCMC 17.65.050.C.6. The City's Transportation System Plan is an ancillary component part of the Comprehensive Plan. The City's TSP project S28 identifies a shared use path running north and south along the east side of this property. The purpose of this path is to connect development on this property and throughout the Hilltop Area to the Newell Creek Nature Park, whose access is located one block north of the subject property. This multimodal path will provide direct access to the 208-unit multi-family residential component on Parcel B as well as serve as a resource for employees and customers of the adjacent businesses.

Goal 1 of Chapter 3 of the Comprehensive Plan provides:

> "Provide a safe, comfortable, and accessible transportation network that serves all modes of travel, including non-motorized modes."

The proposed location of the shared use path as proposed is below the development Parcel B below the top of the hillside and will not be visible to the general public. This is a problem because its lack of visibility will compromise its accessibility but more importantly, could create nuisance concerns. For this reason, the City finds that the proposed path location will not result in a pedestrian connection that is safe and comfortable for public use. In order to satisfy the TSP as well as the Comprehensive Plan, revised conditions of approval are proposed which require that a revised design for the multiuse path be submitted as part of the DDP for Parcel B. The revised design shall include a minimum paved 7-foot width that is ADA accessible and lighted to satisfy OCMC 16.12.032.D standards and most importantly, it is at a similar grade such that it is visible from the development at Parcel B. Added benefits of this approach move the path further away from mapped geologic hazards, avoid providing ADA access for complicated grade changes, can take advantage of

parking lot lighting from the Parcel B development and will reduce maintenance concerns. With these conditions, the development will provide a safe and comfortable pedestrian / bicycle connection in compliance with the TSP that is will strengthen the wellbeing of future residents and users of this development.

Revisions to and proposed new conditions include New Condition 17.

Storm Water Drainage
With respect to Metro's comment on Storm water discharge, the applicant must follow the Oregon City Stormwater and Grading Design Standards. These standards require volume control and water quality. Condition #2 of the DDP decision for Parcel C requires the applicant to follow the Stormwater and Grading Design Standards prior to receiving a permit. Furthermore, the applicant is connecting to a 48" outfall pipe which conveys water onto Metro's property. Oregon Drainage Law states that stormwater discharges should be conveyed in the direction of the existing topography in the undisturbed state of the land. The existing land drains towards Metro's property. The Stormwater and Grading Design Standards and Oregon Drainage Law ensure stormwater is not conveyed at any higher volume or velocity that in the existing condition. This will be addressed during detailed design permit review as Conditioned.

None of the comments provided indicates that an approval criterion has not been met or cannot be met through the Conditions of Approval attached to this Staff Report.

II. ANALYSIS AND FINDINGS:

CHAPTER 17.29 MUC MIXED USE CORRIDOR DISTRICT
17.29.010 Designated.
The mixed-use corridor (MUC) district is designed to apply along selected sections of transportation corridors such as Molalla Avenue, 7th Street, Beavercreek Road, and along Warner-Milne Road. Land uses are characterized by high-volume establishments such as retail, service, office, multi-family residential, lodging, recreation and meeting facilities, or a similar use as defined by the Community Development Director. A mix of high-density residential, office, and small-scale retail uses are encouraged in this district. Moderate density (MUC-1) and high density (MUC-2) options are available within the MUC zoning district. The area along 7th Street is an example of MUC-1, and the area along Warner-Milne Road is an example of MUC-2.

17.29.020 - Permitted uses—MUC-1 and MUC-2.
A. Banquet, conference facilities and meeting rooms.
B. Bed and breakfast/boarding houses, hotels, motels, and other lodging facilities.
C. Child care centers and/or nursery schools.
D. Indoor entertainment centers and arcades.
E. Health and fitness clubs.

F. Medical and dental clinics, outpatient; infirmary services.
G. Museums, libraries and cultural facilities.
H. Offices, including finance, insurance, real estate and government.
I. Outdoor markets, such as produce stands, craft markets and farmers markets that are operated on the weekends and after six p.m. during the weekday.
J. Postal services.
K. Parks, playgrounds, playfields and community or neighborhood centers.
L. Repair shops, for radio and television, office equipment, bicycles, electronic equipment, shoes and small appliances and equipment.
M. Multi-family residential, triplexes and quadplexes.
N. One or two dwelling units in conjunction with a nonresidential use, provided that the residential use occupies no more than fifty percent of the total square footage of the development.
O. Restaurants, eating and drinking establishments without a drive-through.
P. Services, including personal, professional, educational and financial services; laundry and dry-cleaning.
Q. Retail trade, including grocery, hardware and gift shops, bakeries, delicatessens, florists, pharmacies, specialty stores, marijuana, and similar, provided the maximum footprint for a standalone building with a single store or multiple buildings with the same business does not exceed sixty thousand square feet.
R. Seasonal sales.
S. Residential care facilities, assisted living facilities; nursing homes and group homes for over fifteen patients licensed by the state.
T. Studios and galleries, including dance, art, photography, music and other arts.
U. Utilities: Basic and linear facilities, such as water, sewer, power, telephone, cable, electrical and natural gas lines, not including major facilities such as sewage and water treatment plants, pump stations, water tanks, telephone exchanges and cell towers.
V. Veterinary clinics or pet hospitals, pet day care.
W. Home occupations.
X. Research and development activities.
Y. Temporary real estate offices in model dwellings located on and limited to sales of real estate on a single piece of platted property upon which new residential buildings are being constructed.
Z. Transportation facilities.
AA. Live/work dwellings.
BB. Accessory dwelling unit in conjunction with a legally established non-conforming single-family dwelling.
CC. Duplex.
DD. After-hours public parking.

Finding: Permitted. The proposed development uses include multi-family residential (17.29.020.M), retail less than 60,000 sf in building area (17.29.020.Q), and restaurant uses (17.29.020.O). Drive-through facilities are s a conditional use. The conditional use is further described in subsequent responses. Seasonal sales are also a permitted use in this zone, which may arise from time to time on the retail pad.
17.29.030 - Conditional uses—MUC-1 and MUC-2 zones.
The following uses are permitted in this district when authorized and in accordance with the process and standards contained in OCMC 17.56:

A. Drive-through facilities;
B. Emergency service facilities (police and fire), excluding correctional facilities;
C. Gas stations;
D. Outdoor markets that do not meet the criteria of OCMC 17.29.020.I;
E. Public utilities and services including sub-stations (such as buildings, plants and other structures);
F. Public and/or private educational or training facilities;
G. Religious institutions;
H. Retail trade, including gift shops, bakeries, delicatessens, florists, pharmacies, specialty stores and any other use permitted in the neighborhood, historic or limited commercial districts that have a footprint for a standalone building with a single store in excess of sixty thousand square feet in the MUC-1 or MUC-2 zone;
I. Hospitals;
J. Parking not in conjunction with a primary use on private property, excluding after-hours public parking;
K. Passenger terminals, excluding bus stops;
L. Shelters.

Finding: Conditionally approved. The proposed standalone restaurant (parcel D) and retail parcel tenant (parcel A) propose drive-through facilities. A drive-through is a conditional use in the MUC-2 zone and will be reviewed by the Planning Commission as a part of this project's General Development Plan process. Further analysis can be found in the 17.56 Conditional Use section of the staff report.

17.29.040 - Prohibited uses in the MUC-1 and MUC-2 zones.
The following uses are prohibited in the MUC district:
A. Distributing, wholesaling and warehousing;
B. Outdoor storage;
C. Outdoor sales that are not ancillary to a permitted use on the same or abutting property under the same ownership;
D. Correctional facilities;
E. Heavy equipment service, repair, sales, storage or rentals (including but not limited to construction equipment and machinery and farming equipment);
F. Kennels;
G. Motor vehicle and recreational vehicle sales and incidental service;
H. Motor vehicle and recreational vehicle repair/service;
I. Self-service storage facilities;
J. Marijuana production, processing, wholesaling, research, testing, and laboratories;
K. Mobile food units, except with a special event permit.

Finding: Not Applicable. The proposed uses for this project are either approved outright or will be reviewed as a conditional use and do not fall within the prohibited uses identified in this section.
17.29.060 - Dimensional standards—MUC-2.
A. Minimum lot area: None.
B. Minimum floor area ratio: 0.25.

Finding: Complies with Condition. The project's overall floor area ratio (FAR) is 0.73, exceeding the minimum requirement for this zone. For each DDP application, the applicant shall indicate how the proposal will meet or exceed the 0.25 minimum floor area requirement of the zone.

C. Minimum building height: Twenty-five feet or two stories except for accessory structures or buildings under one thousand square feet.
D. Maximum building height: Sixty feet.
E. Minimum required setbacks if not abutting a residential zone: None.
F. Minimum required interior and rear yard setbacks if abutting a residential zone: Twenty feet, plus one foot additional yard setback for every two feet of building height over thirty-five feet.
G. Maximum Allowed Setbacks.
1. Front yard: Five feet.
2. Interior side yard: None.
3. Corner side yard abutting street: Twenty feet.
4. Rear yard: None.
Finding: Reviewed at Detailed Development Plan. Each parcel will seek Detailed Development Plan approval following this General Development Plan decision and will elaborate on their respective building heights in those applications; however, each building shall be in compliance with this section, as no dimensional standard adjustments are being requested in the GDP Master plan application. Nothing in the submittal indicates that the applicant will not be able to meet the standards during the DDP review.

H. Maximum site coverage of building and parking lot: Ninety percent.

Finding: Reviewed at Detailed Development Plan: Proposed Total Site Coverage for each of the parcels is shown below, subject to Detailed Development Plan approval for each parcel:

Parcel	Tot Parcel Area (sf)	Building & Parking Lot Area (sf)	Site Coverage (%)
A	85,346	74,500	87+/-
B	288,563	185,000	64+/-
D	87,773	55,000	63+/-

These values are approximate and show broad compliance with the criterion; however, each parcel will provide detailed information with their own Detailed Development Plan applications

I. Minimum landscaping requirement (including parking lot): Ten percent.

Finding: Reviewed at Detailed Development Plan: Proposed landscaping for each of the parcels is shown below, subject to Detailed Development Plan approval for each parcel:

Parcel	Tot Parcel Area (sf)	Proposed Landscape Area (sf)	Landscape Coverage (%)
A	85,346	11,000	13+/-
B	288,563	108,000	37+/-
D	87,773	34,000	39+/-

These values are approximate and show broad compliance with the criterion; however, each parcel will provide detailed information with its own Detailed Development Plan applications

J. Residential minimum net density of 17.4 units per acre, except that no minimum net density shall apply to residential uses proposed above nonresidential uses in a mixed-use configuration or to live/work dwellings.

Finding: Reviewed at Detailed Development Plan: Parcel B includes multi-family residential use with 208 total units. The total area of Parcel B is 288,617 sf. Of that total area, the area east of the geologic hazard area 35-ft setback line, building setback line along the north property line, the area covered by a PUE, and that area included within the proposed public sanitary sewer easement are excluded. The net developable area then becomes 199,641 sf or 4.58 acres, resulting in a net residential density of 45.3 units per acre, which exceeds the minimum density identified in this criterion

17.29.070 - Floor area ratio (FAR).

Floor area ratios are a tool for regulating the intensity of development. Minimum FARs help to achieve more intensive forms of building development in areas appropriate for larger-scale buildings and higher residential densities.

A. The minimum floor area ratios contained in OCMC 17.29.050 and 17.29.060 apply to all nonresidential and mixed-use building development, except stand-alone commercial buildings less than ten thousand square feet in floor area.

B. Required minimum FARs shall be calculated on a project-by-project basis and may include multiple contiguous blocks. In mixed-use developments, residential floor space will be included in the calculations of floor area ratio to determine conformance with minimum FARs.

C. An individual phase of a project shall be permitted to develop below the required minimum floor area ratio provided the applicant demonstrates, through covenants applied to the remainder of the site or project or through other binding legal mechanism, that the required density for the project will be achieved at project build out.

Finding: Complies with Condition. The project's overall floor area ratio (FAR) is 0.73, exceeding the minimum requirement for this zone. For each DDP application, the applicant shall indicate how the proposal will meet or exceed the 0.25 minimum floor area requirement of the zone.

CHAPTER 17.44 – GEOLOGIC HAZARDS

17.44.010 – Intent and Purpose.

The intent and purpose of the provisions of this chapter are:

A. To ensure that activities in geologic hazard areas are designed based on detailed knowledge of site conditions in order to reduce the risk of private and public losses;

B. To establish standards and requirements for the use of lands within geologic hazard areas;

C. To provide safeguards to prevent undue hazards to property, the environment, and public health, welfare, and safety in connection with use of lands within geologic hazard areas;

D. To mitigate risk associated with geologic hazard areas, not to act as a guarantee that the hazard risk will be eliminated, nor as a guarantee that there is a higher hazard risk at any location. Unless

otherwise provided, the geologic hazards regulations are in addition to generally applicable standards provided elsewhere in the Oregon City Municipal Code.

Finding: Complies with Condition. The applicant's proposed development contains a geologic hazards overlay zone on the eastern portion of the property in the form of steep slopes and landslide materials. The figures below identify the darker geological hazard with their lighter buffer areas:

Figure 7: Steep Slope Area with 50 ft. buffer

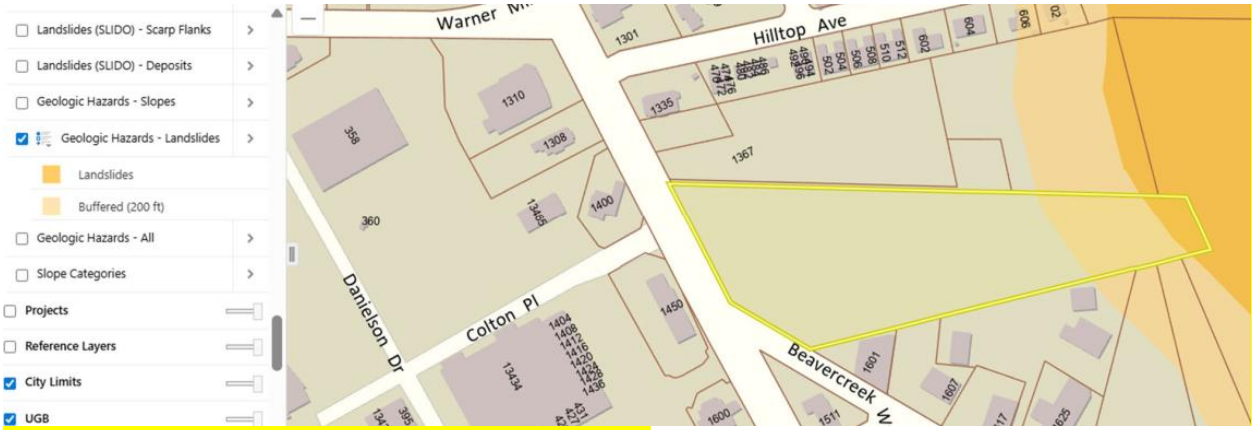

Figure 8: Mapped Landslide Area with 200 ft. buffer.

Development within the shaded areas is limited per the code standards within Chapter 17.44. Most of the property is not impeded by the geological hazards overlay zone and would develop under typical standards noted within this report. Furthermore, development can occur, although in a more restrictive manner, within the portion of the site containing the mapped geological hazard areas within the geologic hazard overlay zone. The applicant will be required to meet the conditions of approval for OCMC 17.44 as part of each DDP within the mapped Geological Hazard Overlay Zone.

The City has provided more in-depth findings and conditions regarding the impacts within the geologic hazards overlay zone to the future phases of this development under OCMC 17.65.050.C within this staff report.

CHAPTER 17.50 – ADMINISTRATION AND PROCEDURES

17.50.010 Purpose.
This chapter provides the procedures by which Oregon City reviews and decides upon applications for all
permits relating to the use of land authorized by ORS 92, 197 and 227. These permits include all form of land divisions, land use, limited land use and expedited land division and legislative enactments and amendments to the Oregon City Comprehensive Plan and Titles 16 and 17 of this code. Pursuant to ORS 227.175, any applicant may elect to consolidate applications for two or more related permits needed for a single development project. Any grading activity associated with development shall be subject to preliminary review as part of the review process for the underlying development. It is the express policy of the City of Oregon City that development review not be segmented into discrete parts in a manner that precludes a comprehensive review of the entire development and its cumulative impacts.

17.50.050 – Pre-application conference.
A. Pre-application Conference. Prior to a Type II – IV or Legislative application, excluding Historic Review, being deemed complete, the applicant shall schedule and attend a pre-application conference with City staff to discuss the proposal, unless waived by the Community Development Director. The purpose of the pre-application conference is to provide an opportunity for staff to provide the applicant with information on the likely impacts, limitations, requirements, approval standards, fees and other information that may affect the proposal.
1. To schedule a pre-application conference, the applicant shall contact the Planning Division, submit the required materials, and pay the appropriate conference fee.
2. At a minimum, an applicant should submit a short narrative describing the proposal and a proposed site plan, drawn to a scale acceptable to the City, which identifies the proposed land uses, traffic circulation, and public rights-of-way and all other required plans.
3. The Planning Division shall provide the applicant(s) with the identity and contact persons for all affected neighborhood associations as well as a written summary of the pre-application conference.

Finding: Complies as Proposed. The applicant held a pre-application conference (PA 25-16) for this proposal on April 22, 2025

17.50.055 - Neighborhood association meeting.
Neighborhood Association Meeting. The purpose of the meeting with the recognized neighborhood association is to inform the affected neighborhood association about the proposed development and to receive the preliminary responses and suggestions from the neighborhood association and the member residents.
A. Applicants applying for annexations, zone change, comprehensive plan amendments, conditional use, Planning Commission variances, subdivision, or site plan and design review (excluding minor site plan and design review), general development master plans or detailed development plans applications shall schedule and attend a meeting with the City-recognized neighborhood association in whose territory the application is proposed no earlier than one year

prior to the date of application. Although not required for other projects than those identified above, a meeting with the neighborhood association is highly recommended.
B. The applicant shall request via email or regular mail a request to meet with the neighborhood association chair where the proposed development is located. The notice shall describe the proposed project. A copy of this notice shall also be provided to the chair of the citizen involvement committee.
C. A meeting shall be scheduled within thirty days of the date that the notice is sent. A meeting may be scheduled later than thirty days if by mutual agreement of the applicant and the neighborhood association. If the neighborhood association does not want to, or cannot meet within thirty days, the applicant shall host a meeting inviting the neighborhood association, citizen involvement committee, and all property owners within three hundred feet to attend. This meeting shall not begin before six p.m. on a weekday or may be held on a weekend and shall occur within the neighborhood association boundaries or at a city facility.
D. If the neighborhood association is not currently recognized by the City, is inactive, or does not exist, the applicant shall request a meeting with the citizen involvement committee.
E. To show compliance with this section, the applicant shall submit a copy of the email or mail notice to the neighborhood association and CIC chair, a sign-in sheet of meeting attendees, and a summary of issues discussed at the meeting. If the applicant held a separately noticed meeting, the applicant shall submit a copy of the meeting flyer, postcard or other correspondence used, and a summary of issues discussed at the meeting and submittal of these materials shall be required for a complete application.

Finding: Complies as Proposed. The applicant met with the Hillendale Neighborhood Association on October 7, 2025

17.50.070 Completeness review and one hundred twenty-day rule.
A. Upon submission, the Community Development Director shall date stamp the application form and verify that all of the appropriate application review fee(s) have been submitted. Upon receipt of all review fees and an application form, the Community Development Director will then review the application and all information submitted with it and evaluate whether the application is complete enough to process. Within thirty days of receipt of the application and all applicable review fees, the Community Development Director shall complete this initial review and issue to the applicant a written statement indicating whether the application is complete enough to process, and if not, what information shall be submitted to make the application complete.
B. The applicant has one hundred eighty days from the date the application was made to submit the missing information or the application shall be rejected and the unused portion of the application fee returned to the applicant. If the applicant submits the requested information within the one hundred eighty-day period, the Community Development Director shall again verify whether the application, as augmented, is complete. Each such review and verification shall follow the procedure in subsection A of this section.
The application will be deemed complete for the purpose of this section upon receipt by the Community Development Director of:
1. All the missing information;
2. Some of the missing information and written notice from the applicant that no other information will be provided; or
3. Written notice from the applicant that none of the missing information will be provided.

C. Once the Community Development Director determines the application is complete enough to process, or the applicant refuses to submit any more information, the City shall declare the application complete. Pursuant to ORS 227.178, the City will reach a final decision on an application within one hundred twenty calendar days from the date that the application is determined to be or deemed complete unless the applicant agrees to suspend the one hundred twenty-calendar-day timeline or unless state law provides otherwise. The one hundred twenty-day period, however, does not apply in the following situations:
1. Any hearing continuance or other process delay requested by the applicant shall be deemed an extension or waiver, as appropriate, of the one hundred twenty-day period.
2. Any delay in the decision-making process necessitated because the applicant provided an incomplete set of mailing labels for the record property owners within three hundred feet of the subject property shall extend the one hundred twenty-day period for the amount of time required to correct the notice defect.
3. The one hundred twenty-day period does not apply to any application for a permit that is not wholly within the City's authority and control.

4. The one hundred twenty-day period does not apply to any application for an amendment to the City's comprehensive plan or land use regulations nor to any application for a permit, the approval of which depends upon a plan amendment.
D. A one hundred day-period applies in place of the one hundred twenty-day period for affordable housing projects where:
1. The project includes five or more residential units, including assisted living facilities or group homes;
2. At least fifty percent of the residential units will be sold or rented to households with incomes equal to or less than sixty percent of the median family income for Clackamas County or for the state, whichever is greater; and
3. Development is subject to a covenant restricting the owner and successive owner from selling or renting any of the affordable units as housing that is not affordable for a period of sixty years from the date of the certificate of occupancy.
E. The one hundred twenty-day period specified in OCMC 17.50.070.C or D may be extended for a specified period of time at the written request of the applicant. The total of all extensions may not exceed two hundred forty-five calendar days.
F. The approval standards that control the City's review and decision on a complete application are those which were in effect on the date the application was first submitted.

Finding: Complies. The application was deemed complete on December 18, 2025. The 120-day decision date for this application is April 7, 2025, and was extended by the applicant to May 17, 2026

17.50.080 Complete application—Required information.
Unless stated elsewhere in OCMC 16 or 17, a complete application includes all the materials listed in this
subsection. The Community Development Director may waive the submission of any of these materials if not deemed to be applicable to the specific review sought. Likewise, within thirty days of when the application is first submitted, the Community Development Director may require additional information, beyond that listed in this subsection or elsewhere in Titles 12, 14, 15, 16, or

17, such as a traffic study or other report prepared by an appropriate expert. In any event, the applicant is responsible for the completeness and accuracy of the application and all of the supporting documentation, and the City will not deem the application complete until all information required by the Community Development Director is submitted. At a minimum, the applicant shall submit the following:
A. One copy of a completed application form that includes the following information:
1. An accurate address and tax map and location of all properties that are the subject of the application;
2. Name, address, telephone number and authorization signature of all record property owners or contract owners, and the name, address and telephone number of the applicant, if different from the property owner(s);
B. A complete list of the permit approvals sought by the applicant;
C. A complete and detailed narrative description of the proposed development;
D. A discussion of the approval criteria for all permits required for approval of the development proposal that explains how the criteria are or can be met or are not applicable, and any other information indicated by staff at the pre-application conference as being required;
E. One copy of all architectural drawings and site plans shall be submitted for Type II—IV applications.
One paper copy of all application materials shall be submitted for Type I applications;
F. For all Type II—IV applications, the following is required:
1. An electronic copy of all materials.
2. Mailing labels or associated fee for notice to all parties entitled under OCMC 17.50.090 to receive mailed notice of the application. The applicant shall use the names and addresses of property owners within the notice area indicated on the most recent property tax rolls.
3. Documentation indicating there are no liens favoring the City on the subject site.
4. A receipt from the county assessor's office indicating that all taxes for the lot or parcels involved are paid in full for the preceding tax year.
5. A current preliminary title report or trio for the subject property(ies);
G. All required application fees;
H. Annexation agreements, traffic or technical studies (if applicable);
I. Additional documentation, as needed and identified by the Community Development Director.

Finding: Complies The application was deemed complete on December 18, 2025.

17.50.090 - Public notices.
All public notices issued by the City announcing applications or public hearings of quasi-judicial or legislative actions, shall comply with the requirements of this section.
A. Notice of Type II Applications. Once the Community Development Director has deemed a Type II application complete, the City shall prepare and send notice of the application, by first class mail, to all record owners of property within three hundred feet of the subject property and to any city-recognized neighborhood association whose territory includes the subject property. The applicant shall provide or the City shall prepare for a fee an accurate and complete set of mailing labels for these property owners and for posting the subject property with the City-prepared notice in accordance with OCMC 17.50.100. The City's Type II notice shall include the following information:
1. Street address or other easily understood location of the subject property and city-assigned planning file number;

2. A description of the applicant's proposal, along with citations of the approval criteria that the City will use to evaluate the proposal;
3. A statement that any interested party may submit to the City written comments on the application during a fourteen-day comment period prior to the City's deciding the application, along with instructions on where to send the comments and the deadline of the fourteen-day comment period;
4. A statement that any issue which is intended to provide a basis for an appeal shall be raised in writing during the fourteen-day comment period with sufficient specificity to enable the City to respond to the issue;
5. A statement that the application and all supporting materials may be inspected, and copied at cost, at City Hall during normal business hours;
6. The name and telephone number of the planning staff person assigned to the application or is otherwise available to answer questions about the application;
7. The notice shall state that a city-recognized neighborhood association requesting an appeal fee waiver pursuant to OCMC 17.50.290.C must officially approve the request through a vote of its general membership or board at a duly announced meeting prior to the filing of an appeal.

Finding: Complies. A public notice was sent to all properties within 300 feet of the site and signs were placed on the property within 20 days of the scheduled hearing. Copies of the public notice and affidavit of sign posting are in the record.

B. Notice of Public Hearing on a Type III or IV Quasi-Judicial Application. Notice for all public hearings concerning a quasi-judicial application shall conform to the requirements of this subsection. At least twenty days prior to the hearing, the City shall prepare and send, by first class mail, notice of the hearing to all record owners of property within three hundred feet of the subject property and to any city-recognized neighborhood association whose territory includes the subject property. The City shall also publish the notice on the City website within the City at least twenty days prior to the hearing. Pursuant to OCMC 17.50.080.H, the applicant is responsible for providing an accurate and complete set of mailing labels for these property owners and for posting the subject property with the City-prepared notice in accordance with OCMC 17.50.100. Notice of the application hearing shall include the following information:
1. The time, date and location of the public hearing;
2. Street address or other easily understood location of the subject property and city-assigned planning file number;
3. A description of the applicant's proposal, along with a list of citations of the approval criteria that the City will use to evaluate the proposal;
4. A statement that any interested party may testify at the hearing or submit written comments on the proposal at or prior to the hearing and that a staff report will be prepared and made available to the public at least seven days prior to the hearing;
5. A statement that any issue which is intended to provide a basis for an appeal to the City Commission shall be raised before the close of the public record. Issues must be raised and accompanied by statements or evidence sufficient to afford the City and all parties to respond to the issue;
6. The notice shall state that a city-recognized neighborhood association requesting an appeal fee waiver pursuant to OCMC 17.50.290.C must officially approve the request through a vote of its general membership or board at a duly announced meeting prior to the filing of an appeal;

7. A statement that the application and all supporting materials and evidence submitted in support of the application may be inspected at no charge and that copies may be obtained at reasonable cost at the planning division offices during normal business hours; and
8. The name and telephone number of the planning staff person responsible for the application or is otherwise available to answer questions about the application.

17.50.100 - Notice posting requirements.
Where this chapter requires notice of a pending or proposed permit application or hearing to be posted on the subject property, the requirements of this section shall apply.
A. City Guidance and the Applicant's Responsibility. The City shall supply all of the notices which the applicant is required to post on the subject property and shall specify the dates the notices are to be posted and the earliest date on which they may be removed. The City shall also provide a statement to be signed and returned by the applicant certifying that the notice(s) were posted at the correct time and that if there is any delay in the City's land use process caused by the applicant's failure to correctly post the subject property for the required period of time and in the correct location, the applicant agrees to extend the applicable decision-making time limit in a timely manner.
B. Number and Location. The applicant shall place the notices on each frontage of the subject property. If the property's frontage exceeds six hundred feet, the applicant shall post one copy of the notice for each six hundred feet or fraction thereof. Notices do not have to be posted adjacent to alleys or unconstructed right-of-way. Notices shall be posted within ten feet of the street and shall be visible to pedestrians and motorists. Notices shall not be posted within the public right-of-way or on trees. The applicant shall remove all signs within ten days following the event announced in the notice.
Finding: Complies. A public notice was sent to all properties within 300 feet of the site, and signs were placed on the property within 20 days of the scheduled hearing. Copies of the public notice and affidavit of sign posting are in the record.

CHAPTER 17.52 OFF-STREET PARKING AND LOADING
This application was submitted on June 27, 2025, prior to the adoption of the recent Climate-Friendly & Equitable Communities (CFEC) Code changes. The following chapter and analysis do not include those revisions. Additionally, as part of the master plan, future DDPs may choose to use the code effective at the time of GDP master plan adoption, or the code in place at the time of Detailed Development Plan submission.

17.52.010 - Applicability.
The construction of a new structure or parking lot, or alterations to the size or use of an existing structure, parking lot or property use shall require site plan review approval and compliance with this chapter. This chapter does not apply to single-family detached residential dwellings, duplexes, townhouses, and cottage clusters.

Finding: Applies. The proposal includes a new or expansion to an existing parking lot.

17.52.015 - Planning commission adjustment of parking standards.

A. Purpose. The purpose of permitting a planning commission adjustment to parking standards is to provide for flexibility in modifying parking standards in all zoning districts, without permitting an adjustment that would adversely impact the surrounding or planned neighborhood. Adjustments provide flexibility to those uses which may be extraordinary, unique, or provide greater flexibility for areas that can accommodate a denser development pattern based on existing infrastructure and ability to access the site by means of walking, biking or transit. An adjustment to a minimum parking standard may be approved based on a determination by the planning commission that the adjustment is consistent with the purpose of this code, and the approval criteria can be met.
B. Procedure. A request for a planning commission parking adjustment shall be initiated by a property owner or authorized agent by filing a land use application. The application shall be accompanied by a site plan, drawn to scale, showing the dimensions and arrangement of the proposed development and parking plan, the extent of the adjustment requested along with findings for each applicable approval criteria. A request for a parking adjustment shall be processed as a Type III application as set forth in Chapter 17.50.
C. Approval criteria for the adjustment are as follows:
1. Documentation: The applicant shall document that the individual project will require an amount of parking that is different from that required after all applicable reductions have been taken.

Finding: Complies with Condition. While each parcel will seek its own individual Detailed Development Plan (DDP) approval, this Masterplan application seeks adjustment to the required parking criteria as shown below, so that the individual parcel DDP applications will already have received a decision on anticipated parking counts.

Parcel	Proposed Use	Required Parking	Required Criteria	Proposed Parking	Parking Adj Needed?
A	**Retail**	**55 (min); 68 (max)**	**4.10/1ksf (min); 5.00/1ksf (max)**	**102 (7.0/1ksf)**	**Yes**
B	**Multi-Family Residential**	**208 (min); 520 (max)**	**1.00/unit (min); 2.5/unit (max)**	**320**	**No**
D	**Restaurant**	**20 (min); 25 (max)**	**4.10/1ksf (min); 5.00/1ksf (max)**	**58 (11.8/1ksf)**	**Yes**

The figure below will be referenced in the approval criteria findings in this section; it is added at the beginning for reference and is referenced in the conditions of approval.

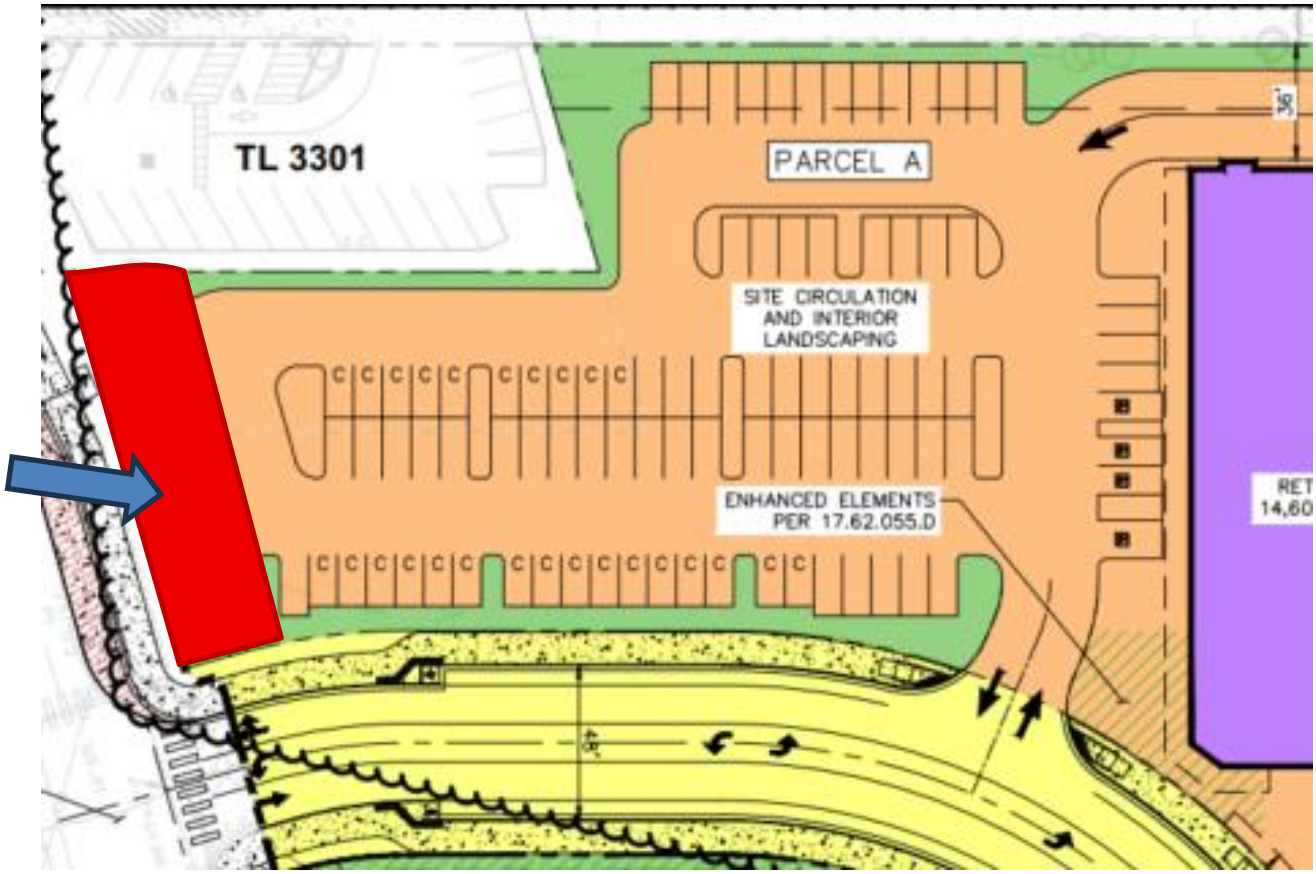

Figure 9 illustrates in red the location of additional enhanced landscaping and the removal of parking to comply with the mitigation requirements for the parking adjustment of Parcel A. This change will eliminate 7-9 parking spaces from the proposed total of 102 spaces.

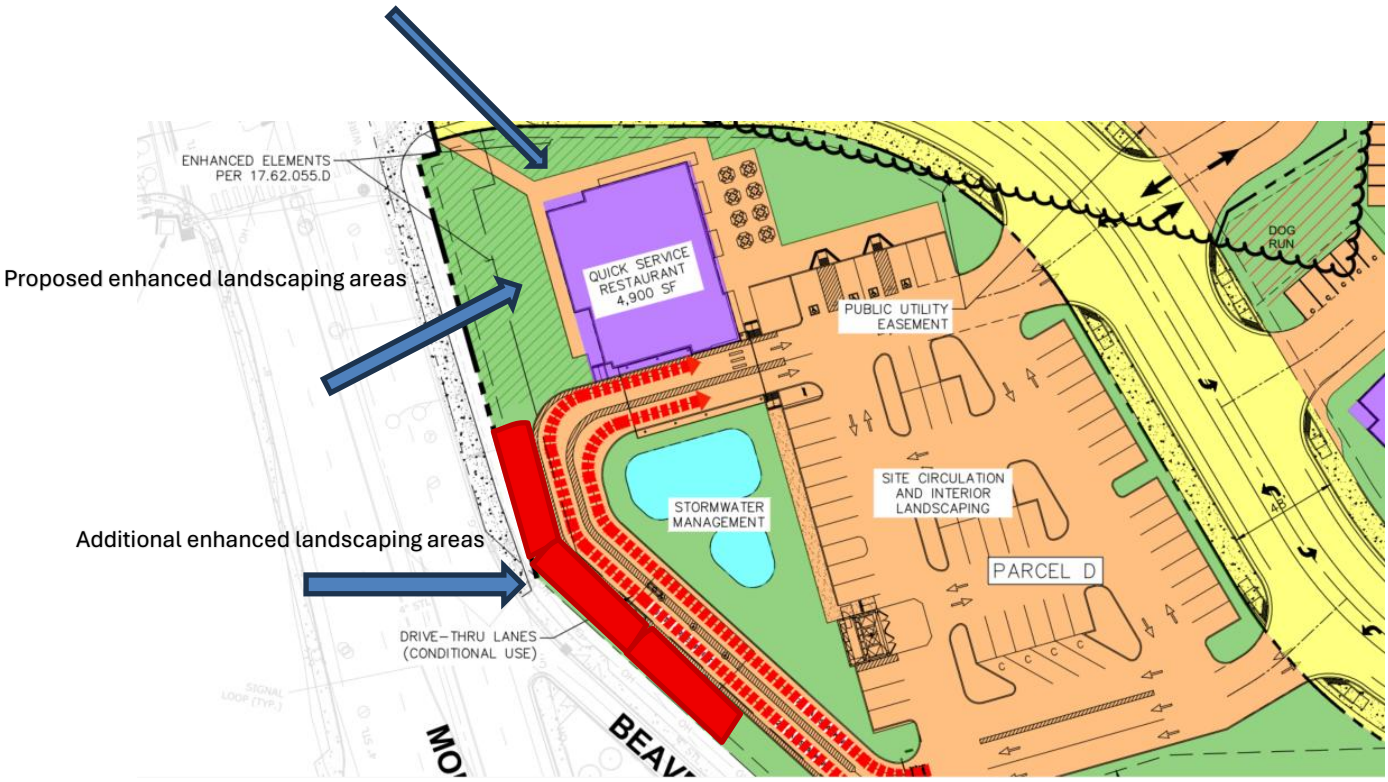

Figure 10 illustrates the locations of the proposed and conditioned (in red) enhanced landscaping to comply with the mitigation requirements for the parking adjustment and the drive-through facility on Parcel D.

2. Parking analysis for Surrounding Uses and on-street parking availability: The applicant shall show that there is a continued fifteen percent parking vacancy in the area adjacent to the use during peak parking periods and that the applicant has permission to occupy this area to serve the use pursuant to the procedures set forth by the Community Development Director.
a. For the purposes of demonstrating the availability of on street parking as defined in OCMC 17.52.020.B.3., the applicant shall undertake a parking study during time periods specified by the Community Development Director. The time periods shall include those during which the highest parking demand is anticipated by the proposed use. Multiple observations during multiple days shall be required. Distances are to be calculated as traversed by a pedestrian that utilizes sidewalks and legal crosswalks or an alternative manner as accepted by the Community Development Director.
b. The onsite parking requirements may be reduced based on the parking vacancy identified in the parking study. The amount of the reduction in onsite parking shall be calculated as follows:
i. Vacant on-street parking spaces within three hundred feet of the site will reduce onsite parking requirements by 0.5 parking spaces; and
ii. Vacant on-street parking spaces between three hundred and six hundred feet of the site will reduce onsite parking requirements by 0.2 parking spaces.

Finding: Complies with Condition. The above analysis requirement implies a request for a reduction in parking by evaluating surrounding parking availability, including on-street parking. This project's proposed parking adjustments exceed the maximum required parking, rather than seeking a reduction in parking requirements due to on-street parking or shared parking from another use. Oregon City Municipal Code (OCMC) Table 17.52.020 identifies parking requirements

and groups retail stores, shopping centers, and restaurants in the same category, limiting the maximum parking ratio to 5.0 per thousand square feet. It does not differentiate between use sizes or types within the three applicable uses described (for example: retail store vs grocery store or specialty retail; sit-down restaurants vs quick-service restaurants that generate higher traffic/parking impacts; or larger regional shopping centers vs neighborhood shopping centers). As such, variations in use can have a significant impact on the number of required parking spaces for a given user, which may not fit within the limits of Table 17.52.020.

A Type III parking adjustment review is site-specific and can be context-based. The applicant has provided the following information for the two parcels requesting an adjustment to the parking maximum. Staff generally agrees with the approach contingent on the adoption of an enhanced landscaping condition to provide additional buffering, ensuring that the pedestrian experience is not reduced along Molalla Avenue and that the transit corridor remains a prominent pedestrian connection.

Parcel A Discussion

This project's proposed public street does not include on-street parking. Existing uses north of this parcel preclude shared parking by virtue of adjacent limited parking capacity of the existing QSR, and street connectivity to Hilltop Ave. Additionally, counting on-street parking from Hilltop Ave would preclude parking in front of these existing Hilltop uses by those same uses. There is no on-street parking on Molalla Ave. The shopping center on the west side of Molalla Ave is not likely to be utilized by Parcel A customers given the distance from the Parcel A building entrance and the need to cross Molalla Ave.

A maximum parking ratio of 5.0 may work for larger retail or shopping centers, but the proposed retail use is relatively small at 14,600 sf

The applicant seeks an increase in maximum parking as proposed in the above table. Parking ratios have varied between approximately 5.0 – 7.0 in similar combined retail shops/QSR uses. In locations where their parking ratios have been lower, parking has spilled over to adjacent shopping center parking to make up for demand at this retailer. With this project, the retail shops and QSR combination is a stand-alone location without the ability to share parking with another use or shopping center. If the parking ratio is limited to 5.0, customers would attempt to utilize adjacent parking from Parcel B, thereby reducing available parking for adjacent residential use. Customers may also attempt to utilize parking from Parcel D across the street, reducing available parking for Parcel D and creating an unsafe street crossing situation.

Staff believes that the design is a reasonable approach for the lot, and since no tenants have been identified for this parcel, a parking maximum for use is not warranted. Instead, staff views the approach as allowing additional parking in the no-build/constrained area of the parcel, subject to enhanced landscaping (Condition of Approval; #14) along Molalla Avenue, which will require removing 7-8 parking spaces along the Molalla Avenue frontage. The new building on Parcel A fronts directly onto the new road and will feature a direct pedestrian connection. The transportation analyses reviewed both the impact of the specialty grocery and the multi-tenant commercial, and both met the city's operational standards as conditioned. If, after the Master Plan

is approved, a specialty grocery returns to Parcel A, it can still be implemented through the Type II DDP process and does not require a Type III Amendment to the Master Plan.

Parcel D Discussion:
Required parking for this proposed use is grouped with retail store and shopping center uses and does not recognize the parking demands of a quick service restaurant. Existing development north of the site is comprised of another Quick Service Restaurant (QSR) at the northeast corner of the subject property and single- and multi-family residential, with no connected access to these properties. The adjacent QSR is situated 4'-5' higher in elevation than the subject property and already has limited parking. The adjacent QSR parking ratio is approximately 12.5/1ksf, consistent with the project's requested parking ratio. The adjacent QSR, as with the proposed QSR, is a stand-alone restaurant and not part of a shopping center development where shared parking can occur. Our proposed QSR cannot share parking with other uses without crossing either a major arterial street (Molalla Ave) or our proposed Collector street, thus limiting practical shared parking opportunities. If the parking ratio is limited to 5.0, customers may attempt to utilize parking from Parcels A or B across the street, reducing available parking for these parcels and creating an unsafe street crossing situation. The applicant seeks an increase in maximum parking as proposed in the above table. Based on other locations for this QSR, parking ratios have varied between approximately 12.6 – 20.0. In locations where their parking ratios have been the highest, parking was shared with adjacent development so identifying the exact parking count is difficult to do. This project does not seek an extreme parking ratio. Instead, it seeks a parking ratio consistent with adjacent uses in similar conditions. If the parking ratio is limited to 5.0, customers would attempt to utilize adjacent parking from Parcel B, thereby reducing available parking for adjacent residential use. Customers may also attempt to utilize parking from Parcel D across the street, reducing available parking for Parcel D and creating an unsafe street crossing situation.

3. Function and Use of Site: The applicant shall demonstrate that modifying the amount of required parking spaces will not significantly impact the use or function of the site and/or adjacent sites.

Finding: Complies as Conditioned. Because the new public road separates Parcels A and D, it is unlikely and not very feasible to approach the development with a shared parking approach. If the two parcels were on the same side of the street, staff would be more inclined to pursue a shared parking lot approach. Allowing an increase in the maximum parking for Parcels A and D ensures enough customer parking without relying on shared parking with adjacent uses. Both parcels have standalone lots, so sharing with other on-site uses isn't feasible. Sharing would take parking from Parcel B's residential use or require customers to cross a collector road, adding nearly 600 feet of travel. Increasing maximum parking supports the development's function by preventing parking conflicts among Parcels A, D, and B.

When Parcel A was initially proposed as a small specialty grocery, it made sense to ensure that the maximum number of spaces be allowed on-site. With the redesign of Parcel A to a mix of tenants to be determined, the request for the maximum of 102 spaces on Parcel A does not seem as critical. Parcel A is constrained by a non-build easement on a portion of the Molalla Avenue easement,

which makes placing the building at the corner of the new public street at Molalla Avenue problematic. The proposed location fronting the new public road does provide direct access, but it is more than 25 feet from the intersection. A condition of approval has been added that allows the building on Parcel A to be located as proposed, subject to additional enhanced landscaping along the Molalla Avenue frontage, as shown in Figure 9, which will remove Molalla Avenue frontage from Parcel A either through the creation of a tract or specified easement. The improved landscaping on Parcel A will align with the upgraded landscaping planned for Parcel D, creating a softer transition along Molalla Avenue and reducing potential negative effects on pedestrians.

If the applicant provides additional findings demonstrating that the full 102 parking spaces are needed for Parcel A, the Planning Commission can choose to remove the enhanced land use condition and direct staff to provide additional findings showing that there is adequate mitigation for the proposed parking and the setback location of Building A.

4. Compatibility: The proposal is compatible with the character, scale and existing or planned uses of the surrounding neighborhood.

Finding: Complies as Proposed. Per 17.29.010 **,**The mixed-use corridor (MUC) district is designed to apply along selected sections of transportation corridors such as Molalla Avenue, 7th Street, Beavercreek Road, and along Warner-Milne Road. Land uses are characterized by high-volume establishments such as retail, service, office, multi-family residential, lodging, recreation and meeting facilities, or a similar use as defined by the community development director. A mix of high-density residential, office, and small-scale retail uses are encouraged in this district. Moderate density (MUC-1) and high density (MUC-2) options are available within the MUC zoning district.

The subject property is an infill development within the hilltop commercial area. The proposed increase in maximum parking aligns well with the surrounding uses, including adjacent quick-service restaurant (QSR) locations and shopping center parking.

5. Safety: The proposal does not significantly impact the safety of adjacent properties and rights-of-way.

Finding: Complies as Proposed. The proposed maximum parking adjustment results in a safer development proposal than one in which inadequate parking exists. As noted above, given the stand-alone nature of the subject parcels, any shared parking that may be necessary to satisfy the parking needs of Parcels A & D would result in taking parking away from adjacent residential use or require customers to cross a Collector street or Major Arterial to patron the subject uses.

Enhanced landscaping will provide additional buffering to ensure that the pedestrian experience is not reduced along Molalla Avenue and that the transit corridor remains a prominent pedestrian connection.

6. Services: The proposal will not create a significant impact to public services, including fire and emergency services.

Finding: Complies as Proposed. The proposed increase to the maximum allowable parking will have no negative impact on public services, including fire or emergency services. Additional space created by the added parking allows more room for emergency services, access, and circulation within Parcels A and D. Public and private utility demands are unaffected by the requested parking increase.

CHAPTER 17.56 CONDITIONAL USES

17.56.010 - Permit—Authorization—Standards—Conditions.
A conditional use listed in this title may be permitted, enlarged or altered upon authorization of the Planning Commission in accordance with the standards and procedures of this title. A conditional use permit listed in this section may be permitted, enlarged or altered upon authorization of the Planning Commission or City Commission in accordance with the standards and procedures of this section. Any expansion to, alteration of, or accessory use to a conditional use shall require Planning Commission or City Commission approval of a modification to the original conditional use permit unless authorized in this chapter.

A. Conditional uses, because of their public convenience and necessity and their effect upon the neighborhood shall be permitted only upon the approval of the Planning Commission or City Commission after due notice and public hearing, according to procedure as provided in OCMC 17.50. The applicant shall provide evidence substantiating that all the requirements of this title relative to the proposed use are satisfied, and demonstrate that the proposed use also satisfies the following criteria:
1. The use is listed as a conditional use in the underlying district;
Finding: Applicable. The proposed Masterplan includes two drive-throughs which are identified as a Conditional Use in the MUC-2 zone (OCMC 17.29.030)

2. The characteristics of the site are suitable for the proposed use considering size, shape, location, topography, existence of improvements and natural features;

Finding: Complies as proposed.
The applicant has provided the following findings:
Parcel A & D
The characteristics of the site are suitable for the proposed drive-through facility as the proposed configuration of the drive-through facility is designed in such a way that other site design code elements can still be maintained, drive-through facilities exist immediately north and west of the site, the proposed parcel size can easily accommodate the drive-through facility and allow adequate queuing without impacting site circulation on public roads, and the site topography is gentle enough to accommodate the proposed drive-through while still allowing space for the access easement required for the properties south of the subject property as identified in the Beavercreek Access Management Plan

The property appears to be suitable for the proposed uses. The applicant has proposed several public improvements that are generally consistent with the City's standards (see below for GDP and DDP requirements for public improvements under OCMC 16.12.). The proposed development does not contain severe slopes or other unique features that would require atypical roadway patterns reducing the safety of pedestrian, bicycle, vehicles (i.e. freight or emergency) from accessing the area. The property has an area identified as a geological hazard but impacts to the mapped area appear to be minimal and will be further reviewed with each DDP that impacts it. A small portion of the site near Beavercreek Road contains is part of the City's NROD area and the Applicant has noted that they will mitigate per the City's OCMC 17.49 requirements for any impacts there.

Overall, City Staff do not consider that the proposed development is unsuitable to the site based on the site's existing features. Specific conditions on how the site can meet City standards are noted within this report or will be further reviewed/conditioned with each parcel's DDP.

3. Development shall demonstrate compliance with OCMC 16.12;

Finding: Complies with Condition. The applicant has proposed to construct multiple public facilities to serve this development and the surrounding area. The following are the City's findings and conditions for the public improvements associated with this development:

Transportation

A new roadway connecting Molalla Avenue to Beavercreek Road is identified. Both Molalla Avenue and Beavercreek Road are Major Arterial Roads with the new road connecting them proposed as a collector road. The applicant has requested modifications to the City's standard cross-section for a collector road using the City's modification process under OCMC 16.12 in their DDP. The reduced collector road cross-section generally removes the standard on-street parking, standard third lane east of the proposed commercial development driveways, and a sidewalk through TL 500/501 connecting to Beavercreek Road. Both Molalla Avenue and Beavercreek Road do not contain parking lanes and the applicant's modification request with the DDP explains how sufficient parking with each parcel will be provided. The Applicant's TIA and City staff support these modifications. The portion of the new roadway the runs through TL 500/501 is consistent with the City's Beavercreek Road Access Plan (i.e. Short Term Access Plan) and the City's TSP project S28 by providing an expanded sidewalk on one side of the road to facilitate pedestrian and bicycle connections away from major roadways. When future properties develop to the west, the sidewalk on the west will be provided which is a typical process for half-street like roadways. The public roadway is a necessary facility for public transportation, site access, and emergency services. The proposed public street between Molalla Avenue and Beavercreek Road shall be constructed prior to occupancy of the first developed parcel.

TSP Project S28 is a shared-use path that is intended to connect the Hilltop Avenue neighborhood with the commercial facilities on Beavercreek Road and onward. As noted above, the applicant has proposed that they will construct an expanded sidewalk as a shared-use path along the new road within TL500/501. They propose to continue the shared-use path north towards Hilltop Avenue by leaving the new street alignment and provide a natural path on the eastern edge of the property (TL3200/3400). The Applicant's proposed nature trail and stairway to access the trail from the new

road, is not consistent with the City's accessway standards for offsite pedestrian and bicycle access. Furthermore, the Applicant's proposed alignment does not provide a usable safe shared use path as required by Chapter 1 Goal 3 parts 3.5 and 3.6, Chapter 3 Goal 1, and Chapter 4, Goal 1 part 1.3 of the Comprehensive Plan to address community safety of residents and provisions of multi-modal opportunities. As previously mentioned, the purpose of project S28 is to connect the development and Hilltop neighborhood to pedestrian and bicycle facilities within Beavercreek Road and provide a safe alternative to using vehicular transportation to access Beavercreek Road. Shared use paths which are used as transportation systems are constructed of paved materials, most commonly asphalt. Trails that are fully enveloped within a park are typically paved or unpaved depending on the plan for the park. Since this is a transportation connection from one roadway to another (Hilltop Avenue to Beavercreek Road), the shared use path must be fully paved. Additionally, the path must be located in a safe useable area. The Applicant proposed the path to be located approximately 10 feet below Parcel B's proposed parking lot in elevation with no connection to Parcel B. The path is also proposed to be located within a geologic hazards overlay zone within two proposed steep slopes. No evidence has been provided that the path will be safe from a security perspective or a landslide perspective or useable by Parcel B. Therefore, the path shall be relocated to be along the edge of Parcel B's parking lot for accessibility and security reasons to meet the safety standard. The applicant has proposed design and construction of the shared-use path with the new road's DDP. The City takes no exception to the shared-use path timeline and final design will be addressed with the Applicant's DDP for the new road. However, the City has provided a Condition which allows the path to be built in pieces within the public road DDP and the parcel B DDP if the applicant chooses. Conditions of approval and findings for the S28 shared-use path are identified with the applicant's DDP for the new road. The construction of the shared-use path S28 within TL 3200/3400 may be completed with either the DDP for the new roadway or prior to occupancy of Parcel B.

As part of OCMC 16.12, applicants must address the City's Mobility Standards and provide a traffic impacts analysis (TIA). The analysis evaluates impacts to existing Street Systems and details how the new development can meet City Standards. The City and it's transportation consultant have reviewed the provided TIA and note the following:

- Based on the most recent five years of available crash data (2019 to 2023), critical crash rate calculations, and ODOT SPIS lists, the OR-213/Beavercreek Road intersection was flagged for safety concerns. The TIA notes that since 2023, safety improvements such as signal modifications and improved signage have been completed at this location. As such, no safety mitigations are recommended at this time.
- The development is expected to generate 339 (157 in, 182 out) a.m. peak hour trips, 190 (107 in, 83 out) p.m. peak hour trips, and 2,788 weekday trips. This includes a conservative internal trip capture reduction of 5% in the a.m. peak hour and 25% in the p.m. peak hour, a pass-by rate of 40% for both the a.m. and p.m. peak hours for the Strip Retail (822) land use, and a pass-by rate of 55% for both the a.m. and p.m. peak hours for the Restaurant (934) and Coffee Shop with Drive Through Window (937) land uses.
- Different trip distributions were applied for the commercial and residential land uses.

    - *Commercial Trips (Retail and Fast Food):* Approximately 35% of site trips are expected to travel to/from destinations to the south along Molalla Avenue and Beavercreek Road, and approximately 65% are expected to travel to/from destinations to the north along Molalla Avenue.
    - *Residential Trips:* Approximately 55% of site trips are expected to travel to/from destinations to the south along Molalla Avenue and Beavercreek Road, and approximately 45% are expected to travel to/from destinations to the north along Molalla Avenue.
- Left turn lane warrants were evaluated at future site access intersections. No left turn lane warrants were met.
- All study intersections are expected to meet performance standards under all analysis scenarios.
- A queuing analysis showed queue lengths at the Molalla Avenue/Shared Business Driveway (Safeway) intersection are expected to exceed the available storage for the northbound left turning movement under both background and build conditions in the p.m. peak hour. The 95th percentile queue is expected to exceed the available storage by only one vehicle in the p.m. peak hour only. No mitigation is recommended at this time as it is a background condition.

The findings of the City's review of the TIA show that the proposed development does not fail the City's transportation systems and that the overall concept of the proposed development can meet the City's standards. Additional reviews/conditions will be required with each DDP that are more specific with each parcel (e.g. driveway locations, spacing, sizing, queuing). The City notes the following Conditions of Approval with this GDP:

- Since the TIA assumes a reduction in vehicle trips due to internal trip capture that would occur as walking and/or biking trips, the TIA shall be revised to discuss the project's internal pedestrian and bicycle circulation needs and how the site plan adequately accommodates active modes.
- Minimum AASHTO sight distance requirements shall be met at all site intersections and driveways. Sight distances on the internal local street system shall be approved by the City Engineer prior to final site plan approval (at DDP).
- A proportionate share fee contribution of $404 per p.m. peak hour trip shall be collected for planned improvements at OR-213/Beavercreek Road. The fee amount will be determined as part of future detailed development plan applications.
- Upon development opening, short-term traffic operations will likely exceed the study's reported operations, which may result in traffic congestion and concerns regarding vehicle queuing. Future detailed development plan applications shall address this with their applications.

- Roadway striping improvements on Molalla Avenue and the new public road will be required as part of the DDP which builds the new public road.
- Traffic Signal improvements on Molalla Avenue and the new public road will be required as part of the DDP which builds the new public road.

It should be noted that both the October 2025 and March 2026 versions of the study find that the existing transportation system will adequately accommodate the proposed master plan uses. The October 2025 analysis included a high-volume grocery store with a higher trip count than the currently proposed development in Parcel A. The October 2025 trip count represents a reasonable worst-case development for that parcel from a transportation impact standpoint. If the development for Parcel A changes and is consistent with either the trip count from October 2025 or March 2026 TIA, a new GDP TIA will not be required.

Water

The Applicant has also proposed to provide an expanded water system with this development. The City's Water Master Plan identifies a new 12" water main connecting Molalla Avenue with Beavercreek Road to provide additional system looping. The City will review technical design and specific connection points with the applicant's DDP and technical design review. The proposed 12" water main, connecting Molalla Avenue to Beavercreek Road, shall be constructed prior to the occupancy of the first developed parcel.

Sanitary Sewer

The applicant has proposed a new sanitary sewer main to be installed within the new road. This sewer is needed to serve the developments on Parcels A, B, and D. The proposed layout appears to meet City standards but further technical review and conditions will be considered as part of the DDP and technical permitting. The City's Sewer Master Plan identifies a new sanitary sewer to connect the City's existing system on HIlltop Avenue to the sewer system on Beavercreek Road by gravity. The Applicant has noted that the portion within TL 3200/3400 will be constructed with Parcel B. The City takes no exception to that proposal. The City's identified sanitary extension within Parcel B shall be completed prior to Parcel B's occupancy. The proposed sewer line within the new roadway shall be constructed prior to the occupancy of the first developed parcel.

Stormwater

The applicant has proposed a private and public stormwater design for this development. The proposed application notes a stormwater pond as part of Parcel D for the Quick Service Restaurant (QSR) development. That pond will take in only stormwater runoff from that parcel. The City takes the exception to that approach and will review that design in more detail with Parcel D's DDP. That pond will be constructed as part of Parcel D's development.

The applicant also proposes to construct a second stormwater pond that will treat the runoff from Parcel A, B, and the proposed public roadway. The applicant has proposed to dedicate this pond to the City for public ownership and maintenance. The applicant's stormwater report notes that the combined stormwater collection area to be treated for Parcels A and B is approximately 4 times the size of the proposed public roadway. The proposed Pond is primarily designed to treat the private properties within this development. Typically, with commercial properties (shopping centers,

apartment complexes, industrial complexes, etc.) the stormwater facilities are privately owned and maintained, and the burden is not placed on the City to maintain. With only a fifth of stormwater flows to this pond originating from the public right-of-way, and with commercial developments (like this one) privately maintaining their own stormwater facilities, the proposed pond should not be a public facility maintained by the City. Public stormwater facilities shall only treat stormwater from publicly maintained rights-of-way (i.e. public streets). The applicant shall either separate the public stormwater runoff from the private runoff with separate publicly maintained facilities (e.g. streetside planters or other separate facilities) and privately maintain facilities for private stormwater runoff; or the development can enter into an agreement with the City to privately maintain a combined pond.

The proposed public improvements identified with this GDP are generally consistent with the City's water, sewer, stormwater, and transportation standards. Further refinement to these facilities will be conditioned and reviewed as part of each parcel's DDP to ensure that they meet City standards and design policies.

Staff has determined that it is possible, likely and reasonable that the applicant can meet this standard through the Conditions of Approval.

4. The proposed use will not alter the character of the surrounding area in a manner which substantially limits, impairs or precludes the use of surrounding properties for the primary uses listed in the underlying district;

Finding: Complies with Condition
The applicant has provided the following findings:

Parcel A
The proposed drive-through is situated approximately 36' away from the north property line and approximately 60' – 90' away from the nearest residential use north of the subject property. The drive-through menu board and ordering speaker will be situated on the back (east) side of the building at least 50' south of the north edge of the Parcel A building. The Parcel A drive-through facility will not substantially limit, impair or preclude the continuing use of these residential properties. The proposed Parcel A drive-through facility is comparable in nature to the existing drive-through facility at the adjacent QSR at the northwest corner of the site, which is situated approximately 60' from the adjacent residential use, and will not substantially limit, impair or preclude the continuing operation of the existing QSR use.

Parcel D
The proposed drive-through is situated 350'-530' away from the nearest residential use north of the subject property and is separated by a proposed public street that has no direct connection to the abutting residential properties. The drive-through facility will not substantially limit, impair or preclude the continuing use of these residential properties. The proposed drive-through facility is comparable in nature to the existing drive-through facility at the adjacent QSR at the northwest corner of the site and will not substantially limit, impair or preclude the continuing operation of the existing QSR use. The proposed drive-through facility does not limit, impair or preclude uses in the existing shopping center west of the site. The proposed drive-through facility is comparable in

nature to several of the tenants in this shopping center who also have drive-through facilities. Similarly, the commercial uses south of the subject property are not impacted by the proposed drive-through use. Their uses can continue to operate regardless of the proposed drive-through use. In fact, the proposed drive through lane is configured in a manner that allows future access to properties south of Parcel D in compliance with the Beavercreek Access Management Plan

Staff generally agrees with the approach contingent on the adoption of an enhanced landscaping condition to provide additional buffering, ensuring that the pedestrian experience is not reduced along Molalla Avenue and that the transit corridor remains a prominent pedestrian connection.

5. The proposal satisfies the goals and policies of the City comprehensive plan which apply to the proposed use.

Finding: Complies with Conditions.
The applicant has provided the following findings:

HEALTHY AND WELCOMING COMMUNITIES
Goal 1 – Community Engagement
By virtue of the Conditional Use process before Planning Commission, Comprehensive Plan Goal 1 and its associated policies are satisfied. The proposed drive-through facilities are located in an area of the site with prior development activity (former gas station was located in this portion of the subject property).

Goal 2 – Historic, Artistic, and Cultural Resources Based on coordination with the State Historic Preservation office (SHPO), SHPO has no record of identified archeological objects or sites and no Native American cairn, burial, human remains, sacred objects or objects of cultural patrimony in or adjacent to the project area and does not have any concerns with the project proceeding as planned. The Confederated Tribes of Grand Ronde requested an archeological survey of the site be performed. This survey will be performed prior to detailed construction plan preparation and the results of the survey incorporated into the design in the event they impact the proposed drive-through facility. Comprehensive Plan Goal 2 and its associated applicable policies are met.

Goal 3 – Livability and Access to Community Services
This goal is focused on community-based organizations, access to health care, civic engagement, community safety, and unhoused residents. Policy 3.4 describes the need to support and promote the availability of affordable, healthy food for neighborhoods and describes a strategy of allowing and encouraging the development of small retail centers in residential neighborhoods that provide goods and services for local residents and workers. The Comprehensive Plan identifies the subject property as a Mixed Use Corridor (MUC). The proposed drive-through facilities do not impact access to community services. Restaurants are an allowed use in the Mixed Use Corridor (MUC) Plan District. The proposed drive-through supports the underlying Plan designation.

DIVERSE ECONOMY
Goal 1 – Varied Goods and Services and Employment Options
The proposed drive-through facilities do not negatively impact any of the stated Comprehensive

Plan Policies. The proposed drive-through facilities allow an outright permitted use in this zone to operate in a manner that will bring them to the community and provide another food option.
Goal 2 – Housing Options
The proposed drive-through facility does not impact this goal as it does not impact housing options.
Goal 3 – Implementation of 2040 Vision and Urban Growth Boundary
The proposed drive-through facilities are part of a development that lies within the Urban Growth Boundary and lies within a Comprehensive Plan designation that allows restaurants.
Goal 4 – Supportive Community Features and Sustainable Site/Building Design
The proposed drive-through facility is part of a larger development that incorporates sustainable stormwater design and complies with applicable site and building code elements that have been adopted by the city and therefore have been deemed to satisfy this goal.
Goal 5 – Periodically Amend the Urban Growth Boundary
The proposed drive-through facility does not impact this goal as it lies within the existing Urban Growth Boundary

CONNECTED INFRASTRUCTURE
Goal 1 – Transportation Network Serving Multiple Modes of Travel
The proposed drive-through facilities do not negatively impact the goal of providing multiple modes of travel within the city. It focuses on the specific transportation impacts of the proposed masterplan development and will help support a safe and effective transportation network by being long enough to house drive-through traffic within the site and avoid spilling onto the proposed public street.

Goal 2 – Adequate Public Facilities
The proposed drive-through facilities do not negatively impact the goal of providing public utilities and transportation facilities within the city.

Goal 3 – Comprehensive Public Facilities
The proposed drive-through facilities do not negatively impact the goal of providing comprehensive public utilities facilities within the city. The proposed drive-through facility does not increase the demand for these services.
Goal 4 – Energy Conservation, Sustainability, and Resiliency
The proposed drive-through facilities will follow the same sustainable site improvements, including stormwater quality treatment and detention as the rest of the site improvements.
PROTECTED ENVIRONMENT
Goal 1 – Accessible Recreation
The proposed drive-through facility will have no negative impact on the recreation opportunities within the city.
Goal 2 – Protection of Natural Resources
The proposed drive-through facilities will follow the same sustainable site improvements, including stormwater quality treatment and detention as the rest of the site improvements. Parcel A or D do not include protected natural resources or ecosystems.

Goal 3 – Minimize Impacts of Natural Hazards
The proposed drive-through facility will have no impact on natural hazard events or the city's ability to respond to same.

Goal 4 – Willamette River Greenway The proposed drive-through facility has no impact to the Willamette River Greenway.

Staff generally agrees with the approach for the drive-thrus contingent on the adoption of an enhanced landscaping condition to provide additional buffering, ensuring that the pedestrian experience is not reduced along Molalla Avenue and that the transit corridor remains a prominent pedestrian connection.

The proposed shared use path provides for access and livability; however, its proposed location does not provide the security needs to sustain livability as the current location will be very difficult to police and ensure safety. Furthermore, the path is not connect to Parcel B limiting access to that transportation service which is intended to be provided by the TSP.

The proposed shared use path provides a multimodal need to the region, but its location prevents the path from providing this alternative transportation to the development.

The shared use path is proposed to be located in an area of geologic hazards overlay zone. The location does not protect the resource causing the need to see the shared use path relocated at time of DDP.

The shared use path is proposed to be located in an area of geologic hazards overlay zone. The location does not minimize impacts to the resource causing the need to see the shared use path relocated at time of DDP.

B. Permits for conditional uses shall stipulate restrictions or conditions which may include, but are not limited to, a definite time limit to meet such conditions, provisions for a front, side or rear yard greater than the minimum dimensional standards of the zoning ordinance, suitable landscaping, off-street parking, and any other reasonable restriction, condition or safeguard that would uphold the spirit and intent of the zoning ordinance, and mitigate adverse effect upon the neighborhood properties by reason of the use, extension, construction or alteration allowed as set forth in the findings of the Planning Commission.

Finding: Complete with Condition. The applicant requests no time limit be set on approval of the drive-through facilities as considerable investment in drive-through infrastructure will be made and drive-through facilities are integral to the QSR operations for both Parcels A and D. As proposed, the drive-through facilities already exceed minimum setback requirements for such improvements, and adverse impacts to neighborhood properties are not expected, given location and orientation of the Parcel A menu board and speaker, and the adjacent commercial uses south of the proposed

Parcel D drive-through and the large distance separating the Parcel D drive-through facility from residential properties to the north of the proposed conditional use. Staff have not added a time limit to the approval. The only conditions related to the conditional use approval pertain to the enhanced landscaping, which must be retained unless revised through a future Type III Conditional Use review.

C. Any conditional use shall meet the dimensional standards of the zone in which it is to be located pursuant to subsection B. of this section unless otherwise indicated, as well as the minimum conditions listed below.

Finding: Complies. The applicant has indicated that the proposed developments on parcels A and D can meet the requirements of the Detailed Development Plan unless further specified in the Master Plan conditions of approval. Final review of the proposal will occur at the Type II Detailed Development Review.

D. In the case of a use existing prior to the effective date of the ordinance codified in this title and classified in this title as a conditional use, any change of use expansion of lot area or expansion of structure shall conform with the requirements for conditional use.

Finding: Not Applicable. The proposed drive-through facilities are not a pre-existing use. Accordingly, this criterion is not applicable.

E. The Planning Commission may specifically permit, upon approval of a conditional use, further expansion to a specified maximum designated by the Planning Commission without the need to return for additional review.

Finding: Complies with Condition. Neither the applicant nor staff expects the need to expand the conditional drive-through for Parcel A or D. However, to ensure clarity in the future, staff has provided a condition that identifies what constitutes an expansion of the drive-through, which requires a Type III Planning Commission review.

17.56.020 - Permit—Application.

A. A property owner or authorized agent shall initiate a request for a conditional use by filing an application with the City Recorder. The applicant shall submit a site plan, drawn to scale, showing the dimensions and arrangement of the proposed development. The application shall be accompanied by the filing fee listed in OCMC 17.50.080 to defray the costs of publication, investigation and processing.

Finding: Complies. An application for Conditional Use Approval, together with the applicable review fee, was included in the overall Masterplan land-use application submitted June 27, 2025 (Ref CU-25-00001).

B. Before the Planning Commission or City Commission may act on a conditional use application, it shall hold a public hearing thereon, following procedure as established in OCMC 17.50.

Finding: Complies. The drive-through proposal is being reviewed through a Type III Planning Commission Hearing.

17.56.025 - Minor modifications to legal conditional uses.

Minor modifications to an approved conditional use permit may be permitted. If permitted, the modification shall be reviewed as a minor site plan and design review. A minor modification to an approved conditional use permit is considered one of the following:

A. Modification to a structure for the purpose of enhancing the aesthetics of the building and there is no increase in the interior usable space;

B. Except for shelters, a maximum addition of up to one thousand square feet to a commercial, office, institutional, public, multi-family, or industrial building provided that the addition is not more than thirty-five percent of the original building square footage; or

C. Revisions to parking alignment and/or related vehicle circulation patterns.

Finding: Complies. The applicant acknowledges the requirements to modify a conditional use. The proposed drive-through facilities included in this masterplan application is the initial request. If subsequent modifications are desired, the applicant will seek the applicable procedure for such modification.

17.56.040 - Criteria and standards for conditional uses.

In addition to the standards listed herein in OCMC 17.56.010, which are to be considered in the approval of all conditional uses and the standards of the zone in which the conditional use is located, the following additional standards shall be applicable:

A. Building Openings. The City may limit or prohibit building openings within fifty feet of residential property in a residential zone if the openings will cause glare, excessive noise or excessive traffic which would adversely affect adjacent residential property as set forth in the findings of the Planning Commission.

Finding: Complies

The applicant has provided the following response:

<u>Parcel A Drive-Through</u>

The proposed drive-through is situated approximately 36’ away from the north property line and approximately 60’ – 90’ away from the nearest residential use north of the subject property. The drive-through menu board and ordering speaker will be situated on the back (east) side of the building at least 50’ south of the north edge of the Parcel A building. The Parcel A drive-through facility will not substantially limit, impair or preclude the continuing use of these residential properties. The proposed Parcel A drive-through facility is comparable in nature to the existing drive-through facility at the adjacent QSR at the northwest corner of the site, which is situated approximately 60’ from the adjacent residential use.

<u>Parcel D Drive-Through</u>

The proposed drive-through facility includes a drive-through window on the southerly side of the proposed building. The drive-through window is located more than 225 ft away from the existing MUC-2 property south of the site. No additional building openings are proposed with this drive-through facility. The proposed drive-through facility is expected to include a secondary canopy near the approximate mid-point of the dual drive-through lanes. This canopy is located more than

80 ft away from the existing MUC-2 property to the south of the site. This canopy – as with the rest of the Parcel D improvements - will be further presented/described in the Parcel D Detailed Development Plan.

B. Additional Street Right-of-Way. The dedication of additional right-of-way may be required where the City plan indicates need for increased width and where the street is inadequate for its use; or where the nature of the proposed development warrants increased street width.

Finding: Complies with Condition. The applicant has noted that right-of-way dedication will be provided along Molalla Avenue and for the new street connecting Molalla Avenue with Beavercreek Road. The proposed sizing and alignment appear to be acceptable to the City and would work with this GDP. Specific details and dimensions of the new roadway and public improvements (including modification requests) will be reviewed as part of the development's DDPs. See conditions above regarding right-of way dedications and public improvements under OCMC 16.12.

C. Public Utility or Communication Facility. Such facilities as a utility substation, water storage tank, radio or television transmitter, tower, tank, power transformer, pumping station and similar structures shall be located, designed and installed with suitable regard for aesthetic values. The base of these facilities shall not be located closer to the property line than a distance equal to the height of the structure. Hydroelectric generation facilities shall not exceed ninety megawatts of generation capacity.

Finding: Not Applicable. No public utility or communication facilities such as substations, storage tanks, radio or television or other noted above is proposed.

D. Schools. The site shall be located to best serve the intended area, shall be in conformance with the City plan, shall have adequate access, and shall be in accordance with appropriate State standards.

E. Helipad Landing Facility.
1. Size of runways and landing areas;
2. Approaches and obstructions within the runways and landing areas;
3. Fencing and/or screening to provide visual and noise buffering and to deflect winds or blast due to aircraft operation;
4. Fire protection measures and equipment;
5. Night illumination adequate for operations, and its effects upon surrounding property;
6. Landing markers;
7. Structural adequacy of runways, pads and other structures;
8. Paving and ground cover materials in relation to noise and down wash.
Finding: Not Applicable. The conditional use proposal is for two drive-through facilities**.**

F. Residential Care Facilities.
1. In addition to the general provisions of OCMC 17.56.020, any application shall include a description of the proposed use, including the number of residents and the nature of the condition

or circumstances for which care, or a planned treatment or training program will be provided, the number of staff and the estimated length of stay per resident and the name of the agency responsible for regulating or sponsoring the use.
2. Approval of a conditional use application for a residential care facility shall include the following minimum standards where applicable:
a. The proposed facility shall maintain all applicable licenses required by the appropriate agencies for the use described in the application.
b. All residential care facilities shall be subject to design review. Special considerations for this use are:
i. Compatibility in appearance with the surrounding area;
ii. Provisions of usable on-site open space appropriate to the needs of the residents and the nature of the care, treatment or training provided;
iii. Clearly defined property boundaries.
Finding: Not Applicable. The conditional use proposal is for two drive-through facilities**.**

G. Bed and Breakfast Inns.
1. The bed and breakfast inn shall maintain all applicable licenses required by governmental agencies for the use described in the application.
2. All bed and breakfast inns shall be subject to design review. Special considerations for this use are:
a. Compatibility of the structure in appearance with the surrounding area;
b. Compatibility of the parking facilities in appearance and circulation of traffic with the surrounding area. Parking facilities shall also comply with Chapter 17.52;
c. Compatibility of the signage in appearance with the surrounding area. Signage shall also comply with Chapter 15.28;
d. The number of rooms to be used as overnight public accommodations shall not exceed four rooms in an underlying residential zone, or seven rooms in an underlying nonresidential zone;
e. The owner/operators shall reside in the bed and breakfast inn, or in a residence adjacent to the bed and breakfast inn; and
f. The Planning Commission may allow up to an additional six non-guests to be served along with the guests at a meal.
Finding: Not Applicable. The conditional use proposal is for two drive-through facilities**.**

H. Shelters.
1. Shelters shall be processed as a Type IV review.
2. The shelter shall maintain a written community engagement plan include the following information:
a. Description of purpose and scope of services of the shelter;
b. Population to be housed at the shelter and the process and criteria for the selection of guests;
c. Bed capacity for nightly guests;
d. Hours of operations and curfew, if applicable;
e. 24 hour contact information; and
f. Explanation of how the shelter will address concerns/complaints.
3. Shelters shall hold a meeting with the community prior to commencing operation, and a minimum of once a year each year thereafter. The purpose of the meeting is to discuss the community engagement plan and provide an opportunity for greater communication. Mailed notice

of the meeting shall be provided to property owners within 300 feet, the neighborhood association, and the City. The meeting shall be open to the public.
Finding: Not Applicable. The conditional use proposal is for two drive-through facilities**.**

17.56.060 - Revocation of conditional use permits.
The Planning Commission or the City Commission may initiate administrative action under Chapter 17.50 to revoke any conditional use permit previously issued by the City or, with regard to lands annexed by the City, those such permits issued by the county. The Planning Commission or the City Commission, may revoke such permit upon determining:
A. One or more conditions attached to the grant of the conditional use permit have not been fulfilled; and
B. The unfulfilled condition is substantially related to the issuance of the conditional use permit.

Finding: Complies. The applicant acknowledges the City Commission's authority to revoke conditional use approvals. Staff has not identified any conditions related to this standard.

17.56.070 - Periodic review of conditional use permits.
A. The City Commission may provide for the periodic review of some or all of the conditional use permits previously issued by the City, or, with regard to lands annexed by the City, those such permits issued by the county. In providing for such review, the City Commission may designate classes of such previously issued permits for which periodic review shall be undertaken.
B. Such review shall be accomplished as an administrative action under Chapter 17.50 and shall be limited to the question of whether additional conditions should be imposed on a conditional use in the light of changing circumstances and more efficient implementation of the City's comprehensive plan.
C. Notwithstanding the provisions of Chapter 17.58, any additional conditions shall be met as a requirement for continued operation of the conditional use.

Finding: Complies. The applicant acknowledges the City Commission's periodic review authority for conditional use approvals. Staff has not identified any conditions related to this standard.

CHAPTER 17.65 MASTER PLANS AND PLANNED UNIT DEVELOPMENT
17.65.010 Purpose and intent.
It is the intent of this chapter to foster the growth of major institutions, phased residential, commercial or mixed-use development, and other large-scale development, while identifying and mitigating the impacts of such growth on surrounding properties and public infrastructure. The City recognizes the valuable housing options, services and/or employment opportunities that these developments bring to Oregon City residents. The master plan or planned unit development process is intended to facilitate an efficient and flexible review process for major developments, support innovative and creative land development, and to provide long-term assurance to plan for and execute developments in a phased manner. To facilitate this, the master plan process is structured to allow an applicant to address larger development issues, such as adequacy of infrastructure and transportation capacity, and reserve capacity of the infrastructure and transportation system before expenditure of final design costs. The master plan or planned unit development process is further intended to promote efficiency in land development, maintenance,

street systems and utility networks while providing site layouts that integrate usable and attractive open spaces, site circulation, and the general wellbeing of site users. For the purposes of this chapter, planned unit developments are considered the same as master plans.

17.65.020 What is included in a master plan or planned unit development.
A. A master plan or planned unit development is a two-step process that includes a general development plan and a detailed development plan. A general development plan incorporates the entire area where development is planned for up to the next twenty years from the date of final approval, including the identification of one or more development phases. The general development plan may encompass land that is not currently under the applicant's control, but which eventually may be controlled by the applicant during the duration of the master plan. The plan shall have no effect for lands not currently controlled by the applicant. "Controlled" shall be defined as leased or owned by the applicant. A detailed development plan is the phase or phases of the general development plan that are proposed for development within two years.
B. A master plan or planned unit development identifies the current and proposed uses of the development, proposed project boundaries, and proposed public and private infrastructure needed to serve the development. If approved, the general development plan may be used to allow existing legal non-conforming uses. If conditions of approval from a previous land use decision have not been completed, they shall be modified through the general development plan or completed with new development.
C. A master plan or planned unit development identifies future development impacts, thresholds for mitigation and mitigation improvements and implementation schedules. A threshold for mitigation is the point that determines when or where a mitigation improvement will be required. Examples of "thresholds" include vehicle trips, square feet of impervious surface area, water usage measured in gallons per minute, construction of a building within a general development plan and construction of a building within a certain distance of a residential lot.
Mitigation improvements are necessary when a threshold for mitigation is reached. Examples include road dedication, intersection improvement, road widening, construction of a stormwater or water quality facility, installation of vegetative buffering and wetland restoration or enhancement.
Finding: Complies. The applicant acknowledges the purpose and intent of the masterplan process and chooses to request General Development Plan approval for the overall property and Detailed Development Plan approval for the proposed street improvements and rough grading of the site. Detailed Development Plan approval for Parcels A, B & D will be sought separately from this application.

17.65.030 - Applicability of the Master Plan or Planned Unit Development Regulations.
A. Required for Large Institutional Uses. If the boundaries of an institutional development exceed ten acres in size, the proposed development shall be master planned using the regulations of this chapter. No land use review other than a Type I or II Minor Site Plan and Design Review shall be issued for any institutional development in excess of ten acres in total acreage unless it is accompanied by or preceded by a master plan approval under this chapter. This requirement does not apply to modifications to existing institutional developments unless the modification results in a cumulative square footage increase of over ten thousand total building square feet in an existing institutional development over ten acres.

B. When Required as Part of Previous Land Use Review. The master plan or planned unit development regulations may be used to fulfill a condition of approval from a previous land use decision-requiring master planning for a development.
C. When identified in the Oregon City Comprehensive Plan. The master plan regulations are required for all properties identified for master planning in the land use section of the Oregon City Comprehensive Plan.
D. Voluntarily. An applicant may voluntarily submit a master plan or planned unit development as part of a land use review, including for residential projects.

Finding: Complies. The applicant voluntarily requests General Development Plan approval for the overall property and Detailed Development Plan approval for the proposed street and utility main improvements and rough grading of the site. Detailed Development Plan approval for Parcels A, B & D will be sought separately from this application.

17.65.040 - Procedure.
A. Preapplication Review. Prior to filing for either general development plan or detailed development plan approval, the applicant shall file a pre-application conference pursuant to OCMC 17.50.030.

Finding: Complies. A pre-application conference was held April 22, 2025.

B. General Development Plan. An application for a general development plan describing the long-term buildout of the site shall be reviewed through a Type III procedure. An applicant shall have an approved general development plan before any detailed development plan may be approved unless both are approved or amended concurrently. Amendments to an approved general development plan shall be reviewed under a Type III procedure pursuant to OCMC 17.65.080.

Finding: Complies. An application for A Type III Master Plan -General Development Plan, Conditional Use, and Parking Adjustment was submitted. A detailed development plan was also submitted and is attached as a separate staff report, which can be approved along with the Master Plan at the Planning Commission meeting. Future detailed development plans will be reviewed through a Type II review unless a modification is requested that requires a Type III Master Plan Amendment.

C. Detailed Development Plan. An application for a detailed development plan, is processed through a Type II procedure, as long as it is in conformance with the approved general development plan. Amendments to an approved detailed development plan shall be processed pursuant to OCMC 17.65.080. Once a development has an approved detailed development plan, OCMC 17.62 Site Plan and Design Review is not required.

Finding: Complies. The applicant seeks Detailed Development Plan approval for the proposed street improvements and rough grading of the site (MAS-25-002_GEO-25-007_NROD-25-012), which will be concurrently reviewed with the Master Plan. Detailed Development Plan approval for Parcels A, B & D will be sought separately from this application.

D. Concurrent Review. An applicant may concurrently apply for a general development plan and a detailed development plan. Such a concurrent application is reviewed through the highest procedure that applies to any element of the combined application.

Finding: Complies. The applicant seeks Detailed Development Plan approval for the proposed street improvements and rough grading of the site (MAS-25-002_GEO-25-007_NROD-25-012), which will be concurrently reviewed with the Master Plan. Detailed Development Plan approval for Parcels A, B & D will be sought separately from this application.

E. Relationship to Other Reviews. It is the express policy of the City that development review not be segmented into discrete parts in a manner that precludes a comprehensive review of the entire development and its cumulative impacts.

Finding: Complies. The applicant presents the enclosed application packages for a comprehensive review of the entire development and its cumulative impacts.

F. Duration of General Development Plan. A general development plan shall involve a planning period of up to twenty years. An approved general development plan shall remain in effect until development allowed by the plan has been completed through the detailed development plan process, the plan is amended or superseded, or the plan expires under its stated expiration date either as stated in the approved master plan or planned unit development application or decision of approval.

Finding: Complies with Condition. Per OCMC 17.65.020.A, unless further amended and extended by the Planning Commission, this Master Plan, which includes Tax Lots 3330, 3400, 3200, and 3201, shall control development on the site until March 23, 2046. Tax Lots 500, 501 and 602 are not part of the 20-year Master Plan but are included initially to allow for the DDP construction of the Public Road, which will connect with Beavercreek Road. Future DDP applications are to be processed as Type I or II review as directed by the Oregon City Municipal Code, and the applicant may choose to use either the 2025 code adopted at the time of the Master Plan Amendment submittal (June 27, 2025) or the current code.

17.65.050 - General Development Plan.
A. Existing Conditions Submittal Requirements.
1. Narrative Statement. An applicant shall submit a narrative statement that describes the following:
a. Current uses of and development on the site;
b. For institutions, history or background information about the mission and operational characteristics of the institution that may be helpful in the evaluation of the general development plan, and information about current programs or services;
c. A vicinity map showing the location of the general development plan boundary relative to the larger community, along with affected major transportation routes, transit, and parking facilities. At least one copy of the vicinity map shall be eight and one-half inches by eleven inches in size, and black and white reproducible;

d. Land uses that surround the development site. This may also reference submitted maps, diagrams or photographs;
e. Previous land use approvals within the general development plan boundary and related conditions of approval, if applicable;
f. Existing utilization of the site;
g. Site description, including the following items. May also reference submitted maps, diagrams or photographs:
i. Physical characteristics;
ii. Ownership patterns;
iii. Building inventory;
iv. Vehicle/bicycle parking;
v. Landscaping/usable open space;
vi. FAR/lot coverage;
vii. Natural resources that appear on the City's adopted Goal 5 inventory;
viii. Cultural/historic resources that appear on the City's adopted Goal 5 inventory;
ix. Location of existing trees six inches in diameter or greater when measured four feet above the ground. The location of single trees shall be shown. Trees within groves may be clustered together rather than shown individually; and
x. Geologic hazards pursuant to OCMC 17.44.
h. Existing transportation analysis, including the following items. May also reference submitted maps, diagrams or photographs.
i. Existing transportation facilities, including highways, local streets and street classifications, and pedestrian and bicycle access points and ways;
ii. Transit routes, facilities and availability;
iii. Alternative modes utilization, including shuttle buses and carpool programs; and
iv. Baseline parking demand and supply study (may be appended to application or waived if not applicable).
i. Infrastructure facilities and capacity, including the following items:
i. Water;
ii. Sanitary sewer;
iii. Stormwater management; and
iv. Easements.

Finding: Complies. The applicant has provided all needed information in their submission. Many of the plans are shared with the Concurrent DDP application. While all items have been provided, they are not necessarily fully meeting code and standards. Conditions of Approval will be provided to ensure the development meets all requirements during DDP development and permitting. Specific items of adjustment will be needed for Geologic hazards pursuant to OCMC 17.44, existing transportation facilities, and infrastructure facilities and capacity of Water, Sanitary Sewer, Stormwater management and Easements.

2. Maps and Plans.
a. Existing conditions site plan. Drawn at a minimum scale of one-inch equals one hundred feet (one inch equals one hundred feet) that shows the following items. At least one copy shall be eight and one-half inches x eleven inches in size, and black and white reproducible.
i. Date, north point, and scale of drawing.

ii. Identification of the drawing as an existing conditions site plan.
iii. Proposed development boundary.
iv. All parking, circulation, loading and service areas, including locations of all carpool, vanpool and bicycle parking spaces as required in Chapter 52 of this title.
v. Contour lines at two-foot contour intervals for grades zero to ten percent, and five-foot intervals for grades over ten percent.
b. A site plan or plans, to scale, for the general development plan site and surrounding properties containing the required information identified in OCMC 17.62.040.b, Vicinity map. Depicting the location of the site sufficient to define its location, including identification of nearest cross streets. At least one copy of the vicinity map shall be eight and one-half inches by eleven inches in size, and black and white reproducible.
c. Aerial photo. Depicting the subject site and property within two hundred fifty feet of the proposed development boundaries. At least one copy of the aerial photo shall be eight and one half inches by eleven in size, and black and white reproducible.

Finding: Complies. *The applicant has provided all needed information in their submission. Many of the plans are shared with the Concurrent DDP application.*

B. Proposed Development Submittal Requirements.
1. Narrative statement. An applicant shall submit a narrative statement that describes the following:
a. The proposed duration of the general development plan.
b. The proposed development boundary. May also reference submitted maps or diagrams.
c. A description, approximate location, and timing of each proposed phase of development, and a statement specifying the phase or phases for which approval is sought under the current application. May also reference submitted maps or diagrams.
d. An explanation of how the proposed development is consistent with the purposes of Section 17.65, the applicable zone district or districts, and any applicable overlay district.
e. A statement describing the impacts of the proposed development on inventoried Goal 5 natural, historic or cultural resources within the development boundary or within two hundred fifty feet of the proposed development boundary.
f. An analysis of the impacts of the proposed development on the surrounding community and neighborhood, including:
i. Transportation impacts as prescribed in subsection g below;
ii. Internal parking and circulation impacts and connectivity to sites adjacent to the development boundary and public right-of-ways within two hundred fifty feet of the development boundary;
iii. Public facilities impacts (sanitary sewer, water and stormwater management) both within the development boundary and on City-wide systems; including a phasing plan for all onsite and off-site public improvements, including but not limited to transportation, schools, parks, open space, trails, sewer, water and stormwater, with an analysis off the capacity and improvements required as a result of fully implementing the plan. This analysis shall reference any adopted parks and recreation, public facilities plans and concept plans and identify specific funding mechanisms to address the adequacy of public facilities.
systems; including a phasing plan for all onsite and off-site public
iv. Neighborhood livability impacts;

v. Natural, cultural and historical resource impacts within the development boundary and within two hundred fifty feet of the development boundary.
g. A summary statement describing the anticipated transportation impacts of the proposed development. This summary shall include a general description of the impact of the entire development on the local street and road network, and shall specify the maximum projected average daily trips, projected AM and PM peak hour traffic and the maximum parking demand associated with build-out each phase of the master plan or planned unit development.
h. In addition to the summary statement of anticipated transportation impacts, an applicant shall provide a traffic impact study as specified by City requirements. The transportation impact study shall either:
i. Address the impacts of the development of the site consistent with all phases of the general development plan; or
ii. Address the impacts of specific phases if the City engineer determines that the traffic impacts of the full development can be adequately evaluated without specifically addressing subsequent phases.
i. If an applicant chooses to pursue option h.1., the applicant may choose among three options for implementing required transportation capacity and safety improvements:
i. The general development plan may include a phasing plan for the proposed interior circulation system and for all on-site and off-site transportation capacity and safety improvements required on the existing street system as a result of fully implementing the plan. If this option is selected, the transportation phasing plan shall be binding on the applicant.
ii. The applicant may choose to immediately implement all required transportation safety and capacity improvements associated with the fully executed general development plan. If this option is selected, no further transportation improvements will be required from the applicant. However, if a general development plan is later amended in a manner so as to cause the projected average daily trips, the projected a.m. or p.m. peak hour trips, or the peak parking demand of the development to increase over original projections, an additional transportation impact report shall be required to be submitted during the detailed development plan review process for all future phases of the development project and additional improvements may be required.
iii. The applicant may defer implementation of any and all capacity and safety improvements required for any phase until that phase of the development reaches the detailed development plan stage. If this option is selected, the applicant shall submit a table linking required transportation improvements to vehicle trip thresholds for each development phase.
j. For residential and mixed-use projects:
i. Proposed minimum lot area, width, frontage and yard requirements.
ii. Proposed project density in number of units per acre.
iii. Proposed residential types and number of each.

Finding: Complies. The applicant has provided all needed information in their submission. Many of the plans are shared with the Concurrent DDP application. While all items have been provided, they are not necessarily fully meeting code and standards. Conditions of Approval will be provided to ensure the development meets all requirements during DDP development and permitting. Specific items of adjustment relate to transportation impacts, public facility impacts, and neighborhood livability impacts.

2. Maps and Diagrams. The applicant shall submit, in the form of scaled maps or diagrams, as appropriate, the following information:
a. A preliminary site circulation plan showing the approximate location of proposed vehicular, bicycle, and pedestrian access points and circulation patterns, parking and loading areas or, in the alternative, proposed criteria for the location of such facilities to be determined during detailed development plan review.
b. The approximate location of all proposed streets, alleys, other public ways, sidewalks, bicycle and pedestrian access ways and other bicycle and pedestrian ways, transit streets and facilities, neighborhood activity centers and easements on and within two hundred fifty feet of the site. The map shall identify existing subdivisions and development and un-subdivided or unpartitioned land ownerships adjacent to the proposed development site and show how existing streets, alleys, sidewalks, bike routes, pedestrian/bicycle access ways and utilities within two hundred fifty feet may be extended to and/or through the proposed development.
c. The approximate location of all public facilities to serve the proposed development, including water, sanitary sewer, stormwater management facilities.
d. The approximate location, footprint and building square footage of buildings within of each phase of proposed development, and/or proposed lot patterns for each phase of future development.
e. The approximate locations of proposed parks, playgrounds or other outdoor play areas; outdoor common areas and usable open spaces; and natural, historic and cultural resource areas or features proposed for preservation. This information shall include identification of areas proposed to be dedicated or otherwise preserved for public use and those open areas to be maintained and controlled by the owners of the property and their successors in interest for private use.

Finding: Complies. The applicant has provided all needed information in their submission. Many of the plans are shared with the Concurrent DDP application. While all items have been provided, they are not necessarily fully meeting code and standards. Conditions of Approval will be provided to ensure the development meets all requirements during DDP development and permitting. Specific items of adjustment relate to location of streets, sidewalks, bicycle and pedestrian accessways, public facilities, and the location of Parcel B buildings and parking areas.

C. Approval Criteria for a General Development Plan. The Planning Commission may approve an application for general development plan only upon finding that the following approval criteria are met.
1. The proposed General Development Plan is consistent with the purposes of OCMC 17.65.

Finding: Complies. The Applicant is proposing a Master Plan to create future development parcels for a site zoned Mixed Use Corridor 2. Once approved, each parcel will be submitted for a separate Type II Administrative Detailed Development Plan (DDP) Review when market conditions are ready for each development. The buildings and their locations on the three development parcels are subject to change unless otherwise specified by condition in this application.

While the applicant could have created the development parcels and built the public road through an Administrative Type II Site Plan design review, the Master Plan process will provide the applicant with the needed clarity for phasing and site-wide impact analysis, and ensure that the same code is used for review at the time of each Detailed Development (DDP) application.

2. Development shall demonstrate compliance with OCMC 12.04 16.12, 17.62, if applicable, and 16.08, if applicable.

Finding: Complies with Conditions. The proposed General Development Plan identifies the proposed uses and street patterns of the subject property which has been vacant for nearly twenty-five years. The proposed development will include mixed uses comprised of multi-family residential, retail, and restaurant uses with various adjustments requested born out of the site's geometry and need for a public roadway through the site. The proposed masterplan will be developed in phases, with Phase 1 being the public street and utility improvements together with rough grading of the site. Parcels A, B, and D include retail, multi-family residential, and restaurant uses and will be constructed based on market demand following their individual Detailed Development Plan approval processes. Construction of the individual parcel uses may be concurrent with each other or may be separate. The master plan process is useful for implementing such a development plan by promoting efficiency in the overall development process and infrastructure needed to support the entire development. DDPs relating to the new public road, shared use path, public utilities, and improvements within Molalla Avenue and Beavercreek Road will be required to be in compliance with OCMC 12.04 and 16.12.

3. Public services for transportation, water supply, police, fire, sanitary waste disposal, storm-water disposal, and any other needed public services and facilities including schools and parks for proposed residential uses, are capable of serving the proposed development, or will be made capable by the time each phase of the development is completed.

Finding: Complies with Condition. As noted above under the public improvements requirements for OCMC 16.12, the applicant has proposed several public facilities with this development including a new roadway connecting Molalla Avenue and Beavercreek Road, a water main consistent with the City's Water Master Plan, a new sanitary sewer consistent with the City's Sewer Master Plan, and stormwater facilities. The overall plan appears to be consistent with the City's goals and standards, however specific design details and conditions for each of these facilities will be a part of the site's DDP. A majority of which is concurrently being reviewed as part of the proposed Parcel C's DDP. Some improvements such as portions of the public road, the shared use path, and the stormwater facilities will need significant revision to meet the standards of OCMC 16.12 as well as OCMC 17.44.

The proposed public improvements identified with this GDP are generally consistent with the City's water, sewer, stormwater, and transportation standards. Further refinement to these facilities will be conditioned and reviewed as part of each parcel's DDP to ensure that they meet City standards and design policies.

Staff has determined that it is possible, likely and reasonable that the applicant can meet this standard through the Conditions of Approval.

4. The proposed General Development Plan protects any inventoried Goal 5 natural, historic or cultural resources within the proposed development boundary consistent with the provisions of applicable overlay districts.

Finding: Complies with Condition. No historic records have been identified onsite. The proposed development is adjacent to and overlooks the Newell Creek Canyon, an inventoried Goal 5 natural resource within the city of Oregon City. The property's eastern edge is included in a geologic hazards overlay zone. The applicant's geotechnical analysis recommends a 35-ft setback from the top of bank overlooking Newell Creek Canyon to construct a future parking lot, trail, stormwater facility and roadway.

The Applicant's proposed geohazard setback identified on the plans are not consistent with the City's mapped geological hazard area. The Applicant's setback had been previously proposed with past plans for development of this site when applicable code standards allowed greater disturbances within the City's landslide buffer area with mitigation recommendations from a licensed geotechnical engineer. However, the City amended and updated its Geological Hazard code in 2021 with more restrictive measures within the landslide buffer. OCMC 17.44.060.I states that:

> *For properties with slopes of twenty-five to thirty-five percent between grade breaks or are located within any portion of a mapped landslide and buffer zone:*
>
> *1. For those portions of the property with slopes of twenty-five to thirty-five percent or located within any portion of a mapped landslide and buffer zone, the maximum residential density shall be limited to two dwelling units per acre; provided, however, that where the entire site is less than one-half acre in size, a single dwelling shall be allowed on a lot or parcel existing as of January 1, 1994 and meeting the minimum lot size requirements of the underlying zone;*
>
> *2. An individual lot or parcel with slopes between twenty-five and thirty-five percent or located within any portion of a mapped landslide and buffer zone, shall have no more than fifty percent or four thousand square feet of the surface area, whichever is smaller, graded or stripped of vegetation or covered with structures or impermeable surfaces.*

The potential future development of Parcel B including the location and grading of the shared use path, the proposed stormwater management area, and grading associated with the new public road appear to exceed the maximum allowable disturbance within the City's mapped landslide area.

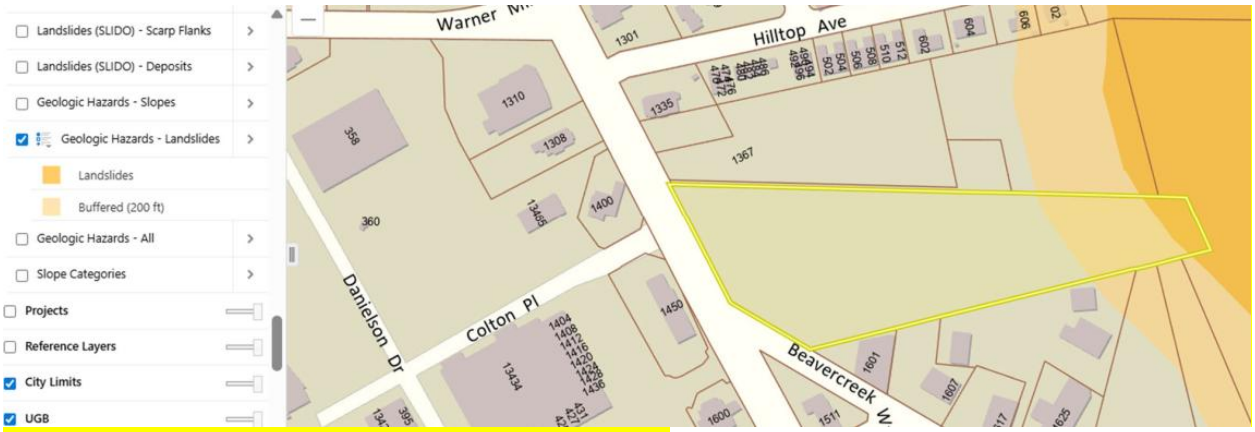

Figure 11: Mapped Landslide areas with 200 ft buffer.

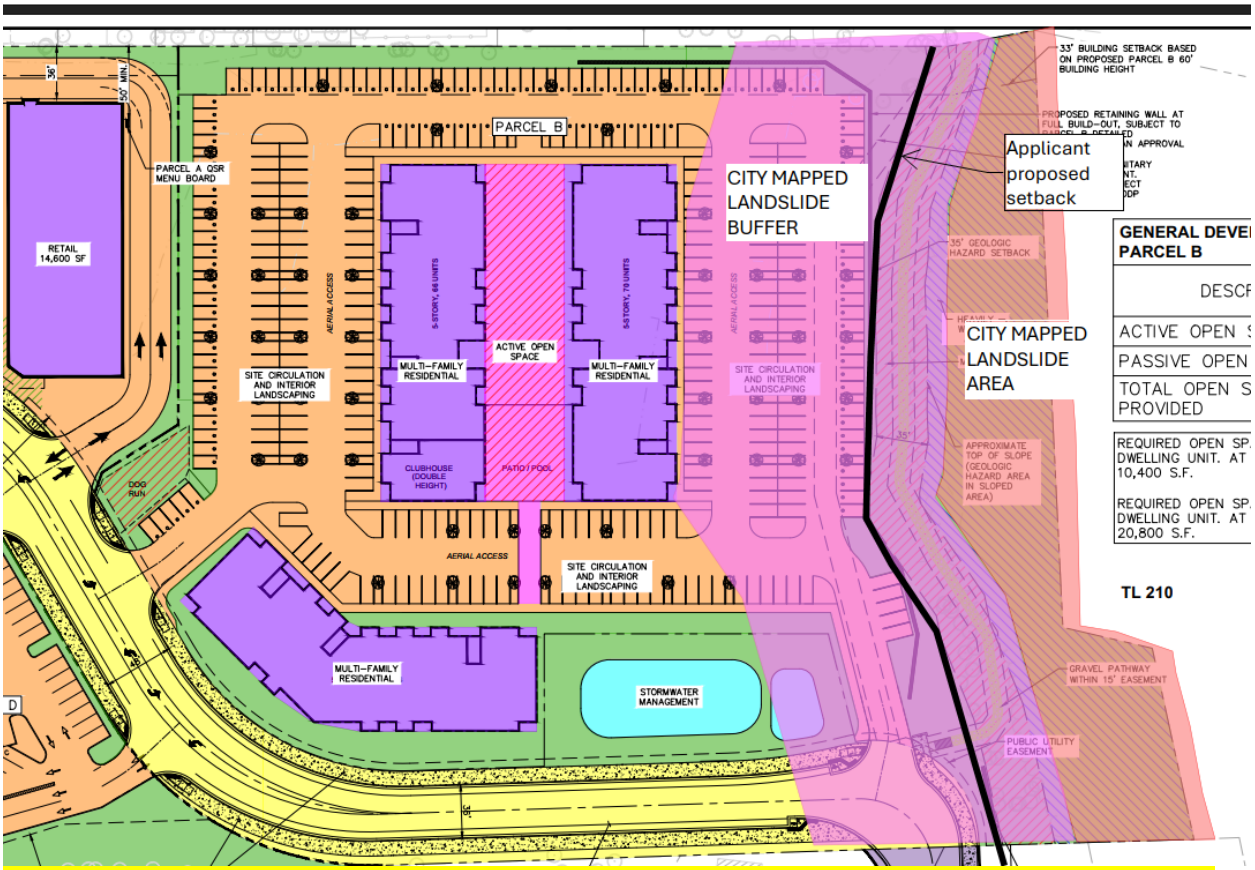

Figure 12: The above picture is an approximation of the Geologic Hazards Overlay Zone landslide and buffer area.

With the City's Geological Hazard updates in 2021, the proposed development's parking, stormwater management area, shared use path, grading, and potentially the dwelling unit density **do not** currently meet code within the buffer area. The proposed development exceeds the maximum of 4,000 sf of surface area graded or stripped of vegetation or covered with structures or impermeable surfaces (i.e. earth disturbance) (which can be assessed per existing parcel as of

1994) and potentially the 2 dwelling unit per acre standard(depending on the final location of the proposed building). Parcel B will require design changes from the proposed to meet the City's Geological Hazard Code within OCMC 17.44 at the time of its DDP. Grading of the site and new public road may need revised to further provide minimal disturbance and be closer to existing grade to meet the 4,000 sf standard on each parcel.

The applicant has proposed to install the TSP S28 shared use path and a potential retaining wall within parcel B within the Geologic Hazards Overlay Zone. The location and grading required for the proposed location of the shared use path and wall does not conform to the Geologic Hazard code grading standards within a landslide buffer as it will have 4,000 sf of surface area graded or stripped of vegetation or covered with structures or impermeable surfaces (i.e. disturbed) . The shared path will need to be relocated to meet this standard. The applicant will be required to meet the conditions of approval for OCMC 17.44 under the Geological Hazard Overlay as part of each DDP within the mapped Geological Hazard Overlay Area. Parcel B's proposed DDP shall be required to make significant changes to its site plan in order to meet the City's Geological Hazard Code within the mapped landslide and steep slope areas for allowable earth disturbance and dwelling unit density.

Additionally, the project's overall stormwater discharge location lies within a Natural Resource Overlay District (NROD) which also drains through the Newell Creek Canyon. The project minimizes impacts to the NROD buffer due to the required public street connection to Beavercreek Rd and mitigates the impact that it does have. The project's stormwater facilities provide both water quality and detention treatment to reduce impacts to the downstream drainage through Newell Creek Canyon. The Geohazard, Stormwater, and Natural Resources Overlay District review can be conducted using the Type II DDP process. No Master Plan or other Type III amendments are required for implementation.

Grading and erosion control permitting will be required for all construction activities meeting the thresholds and standards noted in the City's Stormwater and Grading Design Standards, OCMC 15.48, and OCMC 17.47. Grading within the City's Geological Hazard Area shall comply with OCMC 17.44 for each DDP. If the applicant wishes to grade or prepare Parcel's A, B, and D prior to the future development's DDPs, a grading and erosion control permit is required.

Staff has determined that it is possible, likely and reasonable that the applicant can meet this standard through the Conditions of Approval.

5. The proposed General Development Plan, including development standards and impact mitigation thresholds and improvements, adequately mitigates identified impacts from each phase of development. For needed housing, as defined in ORS 197.303(1), the development standards and mitigation thresholds shall contain clear and objective standards.

Finding: Complies as conditioned . Oregon City's 2021 Housing Needs Analysis identified the need for 7,435 new dwelling units over the next 20 years. The proposed multi-family residential component of the General Development Plan helps the city achieve their goal of providing more

housing. The proposed roadway and signal improvements, together with cost participation in the city's planned Beavercreek Road/Hwy 213 improvements, will mitigate the project's development impact. The roadway and utility improvements are proposed to be constructed with the initial phase of development, with the uses generating the actual impact to follow, thereby providing impact mitigation before the proposed demand.

The proposed impacts to the City's Mapped Geological Hazard Area currently do not comply with OCMC 17.44.060.I. as noted above; however, with conditions the development can comply. The Applicant's Geotechnical Report has provided mitigation recommendations to develop within the City's landslide buffer area. However, although the proposed mitigations may be technically appropriate to reduce potential dangers within the buffer, they are not consistent with the City's code which states that no development shall have more than 4,000 sf surface area graded or stripped of vegetation or covered with structures or impermeable surfaces (i.e. disturbed) within the landslide area or its buffer. The City typically provides a condition of approval noting that developments shall comply with the standards under OCMC 17.44 with the expectation to have site plans refined during technical permitting with each DDP. However, during additional review of the shared use path location, the City has identified that the revisions needed to comply with the code during DDP significantly alters the proposed GDP site plan, particularly with Parcel B. Therefore, a condition has been provided to more explicitly state how complying with City Code 17.44 can be achieved. The City still considers this development to be approvable with the conditions noted above under OCMC 17.65.050.C.4.

Rough Proportionality Findings

The applicant has raised concerns over conditions of approval requiring the building of a shared use path and provide public access and maintenance easement over the same claiming a violation of the Takings Clause of the Fifth Amendment of the United States Constitution and/or Article I, section 18, of the Oregon Constitution which requires the following:

1) An "essential nexus" between "legitimate state interests" and the City's requirement for improvements, as required by *Nollan v. California Coastal Commission*, 483 U.S. 825 (1987);

2) The obligation to provide a public easement would not be "roughly proportional" to the potential impacts of the applicant's proposed development, as required by *Dolan v. City of Tigard*, 512 U.S. 374 (1994); or

3) Monetary contributions to improve the path must comply with Nollan and/or Dolan, as required by *Koontz v. St. Johns Water Management District*, 133 S. Ct. 2586 (2013).

The City must demonstrate that the requirements would comply with applicable law. However, because "the basic thrust of the fifth amendment [of the U.S. Constitution] and art. I, § 18 [of the Oregon Constitution], is generally the same . . ." in this context, *Suess Builders Co. v. City of Beaverton*, 294 Or. 254, 259 n. 5 (1982), this analysis will focus on the federal Takings Clause.

A. Essential Nexus (Nollan)

In *Nollan*, the U.S. Supreme Court held that a permit condition subject to scrutiny under the Takings Clause must have an "essential nexus" to "legitimate state interests." *Nollan*, 483 U.S. at 837. The Court did not decide "what constitutes a 'legitimate state interest' or what type of connection between the [condition] and the state interest . . ." is sufficient, but it noted that long-standing precedent had established that "a broad range of governmental purposes and regulations satisfies these requirements." Id. at 834-35. The purported state interest at issue in *Nollan*, the Court decided, "did not meet even the loosest standard." *Dolan*, 512 U.S. at 386 (citing *Nollan* at 838).

Here, the "essential nexus" is clear. All of the path provision-related requirements are based on legitimate City-approved and applicable standards. Approval of a general development plan requires a finding that the application is in compliance with the Oregon City Comprehensive Plan. OCMC 17.65.050.C.6. The City's Transportation System Plan is an ancillary component part of the Comprehensive Plan. The City's TSP project S28 identifies a shared use path running north and south along the east side of this property. The purpose of this path is to connect development on this property and throughout the Hilltop Area to Beavercreek Road, the Newell Creek Nature Park, whose access is located one block north of the subject property, and Mountainview Cemetery, without requiring travel along Molalla Avenue, a 4-lane arterial that is one of the busiest streets within the City.

Further, all master plan development must be consistent with OCMC 16.12, which sets minimum transportation improvements. The adopted purpose for these standards is to ensure improvements that benefit the public, including future users of the development of adequate public off-street pedestrian and bicycle accessways. OCMC 16.12.010. OCMC 16.12.032 requires that pedestrian / bicycle accessways provide "direct, safe and convenient connections between residential areas, retail and office areas, ...neighborhood activity centers and which minimize out of direction travel." See also Comprehensive Plan Goal 1 of Chapter 3. A safe and convenient accessway is one that is visible from and integrated with adjacent uses. These accessways are required through private property at intervals not exceeding 300 feet or where otherwise convenient. The minimum construction standards demand a "seven-foot wide paved surface," must be lighted and ADA compliant. OCMC 16.12.023(A), (D) and (E). Notably, in order for these accessways to "safe" and "convenient," they must be visible.

The path requirements will be located directly on the property subject to development and would be intended to mitigate the impacts of development at that location (see *Dolan* and *Koontz* discussions below).

These requirements would clearly satisfy the *Nollan* "essential nexus" requirement.

B. Rough Proportionality (Dolan) including Monetary Contributions (*Koontz*)

In *Dolan*, the Court held that requirements imposed on a development must be "roughly proportional" to the impacts of that development. *Dolan* at 391. That standard, the Court wrote, is an "intermediate standard" between "very generalized statements as to the necessary connection," on one hand, and, on the other, a requirement that the government "demonstrate

that its exaction is directly proportional to the specifically created need." *Id*. at 389-90. "Rough proportionality" lies somewhere between those extremes of "too lax" and a level of "exacting scrutiny" that the Constitution does not require. *Id*. As the Court explained, "[n]o precise mathematical calculation is required, but the city must make some sort of individualized determination that the required [exaction] is related both in nature and extent to the impact of the proposed development." *Id*. at 391.

In addition, benefits that will accrue to a development as a result of government-imposed requirements need not be ignored. "[T]he *Dolan* analysis allows consideration and appropriate weighing of whether and to what extent a condition serves needs of the development upon which it is imposed, as distinct from serving only general public needs in response to the public impacts of the development." *Art Piculell Group v. Clackamas County*, 142 Or. App. 327, 337 n.4, 922 P.2d 1227 (1996).

Dolan thus requires that the City (1) enumerate the potential impacts of the proposed development here and (2) demonstrate that the potential requirements would be related to those impacts "in nature and extent."

In *Koontz*, the Supreme Court did not create any new balancing tests or require any new analyses specific to the imposition of monetary contributions such as those required for multimodal path improvements required here. Instead, the Court merely held "that the government's demand for property from a permit applicant must satisfy the requirements of *Nollan* and *Dolan* . . . even when its demand is for money." *Koontz*, 133 S. Ct. at 2603. As a result, if a requirement for a monetary contribution would satisfy the "essential nexus" and "rough proportionality" requirements of those cases, such a requirement would not violate the Takings Clause.

The Potential Impacts of the Development

A. Impact determination

The pedestrian / bicycle demand created by this development is not easy to determine at the GDP phase of development because the ultimate uses are not known. For example, if a bicycle shop is established in the multi-tenant building, it is likely to attract more bicyclists than if it is hardware store. What is known is the proposal includes 14,600 square feet of retail, 204 apartment units and 4,900 sf of fast foot restaurant with drive though. It is likely that these uses will have broad appeal and will attract citywide use. The one-block proximity of this development to the Newell Canyon Natural Area, a popular walking and cycling area, shows that it will attract multimodal uses to a greater degree than other areas of the City.

One way to quantify the level of pedestrian / bicycle use generation anticipated is to take some reference from the applicant's traffic study, which provides some sense of the use-created demand.

Excerpting a portion of the applicant's TIA estimating daily trip generation is as follows:

Land Use	Size	Daily Trips
Mid-Rise Apartments	210 du	710
Retail	14,600 sf	2,174
Restaurant	4,900 sf	2,096

Although these are vehicle trips and the pedestrian / bicycle generation would be far lower, this does give a sense of the number of individuals using the site. These daily trips would include trips both coming to and leaving from subject development so it might be reasonable to cut these projections in half if counting the number of individuals using the site. However, such an approach would also assume that each vehicle includes only one person, which seems unlikely, given the suburban location. According to ODOT and the Oregon Household Survey about 12% of adults in Oregon bike, walk or roll to their destinations. Although in suburban areas that amount is reduced to 5 or 10%, in areas where a car is not required, that number jumps to 52%. Although Oregon City is suburban, the subject property is within walking or cycling of many uses necessary for daily living including shopping, the community college and high school and well as medical and other office services. Assuming that only 8% of the non-residential-related uses are accessed by bicycle or on foot, this would reveal 341.6 non-vehicular trips and some percentage of these are likely to use the new multi-modal path. All of the non-residential uses will be staffed with employees who would likely use the path for recreation during a break or to access Newell Creek for lunch. The highest use of this path will be the residents of the 210 dwelling units proposed on Parcel B. Although it is not clear whether the proposal will include any multi-bedroom uses suitable for families, it is likely that each unit will accommodate at least two people who are likely to use the pedestrian path, not only to access Newell Creek but also in connecting to other shopping centers along Beavercreek Road. An average of two people from half of the units used the path daily, this would add an additional 210 daily trips relying on the path for access. Taken together this is 560 daily trips on this path.

B. Rate of increase in non-vehicular trip generation

To determine what portion of the existing pedestrian / bicycle trip generation exists that might shoulder some proportional cost of this path, the TIA was consulted. What it shows is very low existing non-vehicular traffic within the area. At most intersections, the bicycle usage during peak hour is zero and the pedestrian generation is less than 15. The intersection experiencing the highest non-motorized traffic generation is Molalla and Beavercreek Road, with a PM daily bicycle count of 2 trips and a pedestrian count of 22. Importantly, none of the uses directly adjacent to this intersection or the other intersections evaluated include any multi-family residential. The 210 proposed units far exceed the number of single family residences within the few block radius of the proposed path.

As the next table shows, the applicant's development proposal is expected to increase the number of non-vehicular trips:

Impact Ratio - Daily Trips			
Daily Property Trips	560	=	96%
Daily Non-Development trips	24		4%

This suggests that nearly all of the non-vehicular trips using this path will come from or provide support for this development.

Rough proportionality and the potential requirements

Because this development is anticipated to substantially contribute to the non-vehicular traffic generated, the conditions of approval require the installation of the multi-use path.
This impact mitigation policy has two primary underpinnings, as explained in OCMC 16.12:

1) "Pedestrian/bicycle accessways are appropriate in areas where public street options are unavailable, impractical or inappropriate....at intervals not exceeding three hundred feet." The distance from Molalla Avenue, the closest non-vehicular access across this property, to the rear of this property ~ 1,000 feet. A secondary access is necessary. Further, the City recognizes that although upon initially occupancy, this connection to Newell Creek Canyon will not exist. However, this is a long-term goal. Eventually, the impacts of the applicant's proposed development on the entirety of the Impact Area will be mitigated as other properties are developed or redeveloped. It is reasonable for the applicant to install their portion of this needed connection now as it will not be required to shoulder the remainder of the burden when this connection occurs.

2) "Pedestrian/bicycle accessways are intended to provide direct, safe and convenient connections between...uses." Whereas the first policy goal above is concerned with establishing a framework for piecemeal mitigation of the proposed development's impacts along the entire length of the street, here the City is focused on mitigating at least some of those impacts right away. As soon as it is constructed, this path will provide access to Beavercreek Road that is more direct, efficient and safer than access along Molalla Avenue.

In addition to mitigating the impacts of the applicant's proposed development, installation of a safe, visible and convenient path will directly benefit the applicant which will almost certainly lead to a higher property value.

A. Potential requirements for property dedications

As explained above the minimum city standards demand that the applicant provide public access and maintenance for a 7 foot wide pedestrian path which is necessary to mitigate impacts that will be created by the applicant's proposed development. Importantly, the applicant is not being required to dedicate land to accommodate sidewalks on both side of the new road connecting to Beavercreek Road on Tax Lot 500. Therefore, the public access obligation in this area is far less than would be required for a standard local street.

Nevertheless, to evaluate further the reasonableness of a condition of approval, the City also considers the size of the property dedication in light of the size of the entire property. Those calculations for this development proposal follow:

Length of path = 575 feet long

Public easement dedication width = 15 feet containing a 7-foot wide paved trail.

Property dedication area = 8,625 sq. ft.for the easement

Total Site Area = 567,473 sq. ft.

8,625 sq. ft. exaction area / 567,473 sq. ft. total site area	= 1.5%

The applicant could thus be required to dedicate approximately 1.5% of the property in order to mitigate partially the impacts the proposed development will create. By any measure, this would be a reasonable requirement. The "rough proportionality" standard of Dolan would be satisfied with regard to those potential requirements for the public access easement.

B. Potential requirements for monetary contributions

As noted above, the focus of the cost for these improvements focuses solely on that portion of the path from the proposed road on Tax Lot 500 to the northern boundary. This makes sense because the path providing access through Tax Lot 500 is offered in lieu of sidewalks on both sides. The minimum sidewalk width required on both sides of a local street is 5 feet, meaning that a 10 foot total sidewalk area would be required. The cost of building 5-foot sidewalks on both sides of a street would be commensurate, and likely more than, the cost of building a single 7-foot shared use path.

The City does have reliable private-sector construction cost estimates for those improvements. A similar shared use path was built at Serres Farm. The Serres Farm cost estimate used for bonding was $80,000 for 18,672 sf or about $4.30 per sf. Using the same cost of $4.30 per square foot, the path should cost $17,310 (using 4,025 sq. ft for the paved path construction). Doubling this cost since it is not as big of a path, which staff believes $10 per square foot might be reasonable, the cost would be $40,000.

The City concludes that a requirement to expend up to a total of $40,000 to mitigate the impacts and associated sub-impacts of hundreds of new pedestrian and bicycle trips would be reasonable. The "rough proportionality" standard of Dolan is satisfied with regard to those potential requirements for monetary contributions.

Conclusion

The applicant's proposed development will create a number of non-vehicular impacts. The City may require the applicant to mitigate those impacts with targeted measures that could involve property dedications and monetary contributions. Those mitigation measures subject to the Takings Clause would be limited to area located within the property subject to development and will enhance the livability for future residents, customers and employees. The Supreme Court's "essential nexus" and "rough proportionality" requirements of Nollan/Dolan/Koontz are satisfied.

Staff has determined that it is possible, likely and reasonable that the applicant can meet this standard through the Conditions of Approval.

6. The proposed general development plan is consistent with the Oregon City Comprehensive Plan.

Finding: Complies. As described in the Constitutional Use analysis section of the staff report, the proposed General Development Plan is consistent with the Oregon City Comprehensive Plan. Drive-through locations have been thoughtfully designed to ensure safety and prevent queues from blocking public roads. The associated uses are permitted in the zone; the drive-throughs are located on the side and rear; and the buildings are not exclusively dedicated to drive-through traffic. The applicant has also proposed additional landscaping along Molalla Avenue to enhance the pedestrian experience for Parcel D, and staff has conditioned additional landscaping on Parcel A, which staff believes will improve the area and mitigate any potential visual impacts from the drive-through proposal and continue to support Molalla Avenue to be a major pedestrian connection to transit.

7. The proposed general development plan is consistent with the underlying zoning district(s) and any applicable overlay zone or concept plans.

Finding: Complies as Conditioned. The proposed General Development Plan is consistent with the underlying MUC-2 Zone, Geologic Hazard Overlay (with modifications to Parcel B during DDP), and Natural Resource Overlay. Further detailed analysis will occur at the Detailed Development Plan level for each parcel.

8. For projects with a residential use component, the proposed general development plan includes common open space for the recreational needs of the development's residents.
a. Required open space shall be located either on-site or off-site within one-quarter mile of the development.

Finding: Complies with Condition. Required open space for the Parcel B multi-family component of the General Development Plan is proposed to be located on-site. While Parcel B's Detailed Development Plan will provide detail on the proposed open space, the proposed open space area is shown on the General Development Plan Sheet GDP-C1.0.

b. Minimum required open space shall be 100 square feet per residential unit in the development.

Finding: Complies with Condition. The proposed Parcel B multi-family component of the General Development Plan includes 208 units, resulting in a required open space of 20,800 sf at 100 sf per unit. As shown on General Development Plan set GDP-C1.0, Parcel B includes over 12,000 sf of

open space between the two northerly buildings (subject to Parcel B Detailed Development Plan submittal/approval) and over 20,000 sf of open space between the top of the slope and the geologic hazard setback line. A pedestrian pathway is proposed within this geologic hazard setback. Additionally, over 42,000 sf of forested open space lies on the east edge of Parcel B between the property boundary and the top of slope. Parcel B provides open space far in excess of the minimum required open space.

Note – OCMC 17.62.057.B.2 identifies a smaller open space requirement for mixed-use zones of 50 square feet per residential unit. This results in an open space requirement of 10,400 square feet. The proposed open space will exceed the criteria identified in both 17.65.050.C.8.b and 17.62.057.B.2.

c. The open space area may be in private ownership or proposed for public dedication, at the City's discretion whether to accept.

Finding: Complies with Condition Parcel B open space is currently planned for private ownership. Use of, ownership and maintenance of, and connection to the shared use path can be considered for open space.

d. The open space shall be developed with a unified design to provide for a mix of passive and active uses. Passive uses include, but are not limited to sitting benches, picnicking, reading, bird watching and natural areas. Active uses include, but are not limited to playgrounds, sports fields and courts, running and walking areas.

Finding: Complies with Condition. General Development Plan Sht GDP-C1.0 identifies active open space between the two northerly buildings, and the Geologic Hazard setback area contains a pedestrian pathway. Portions of the Geologic Hazard setback area will be planted with NROD mitigation plantings. The steep slope open space area on the east edge of Parcel B is intended to remain in its natural state**.**

e. Land area to be used for the open space area that is required in this section shall not include required setback areas, required landscaping, streets, rights-of-way, driveways, or parking spaces.

Finding: Complies with Condition. The Geologic Hazard setback area is not a setback required by the city. Instead, it is a setback recommended by the geotechnical engineer to protect against long-term slope stability concerns. Accordingly, it is not considered a building setback for the purpose of this section. However, even if the Geologic Hazard setback area is excluded from open space consideration (not likely, since the project is required to provide a pedestrian pathway), the steep slope area east of the top of slope is more than adequate to satisfy the open space requirements.

f. Unless dedicated to the public, the applicant shall also provide an irrevocable legal mechanism for the maintenance of the open space and any related landscaping and facilities. The applicant shall submit, for City review and approval, all proposed deed restrictions or other legal instruments

used to reserve open space and maintenance of open space and any related landscaping and facilities.

Finding: Complies with Condition. Development of Parcel B will be described in more detail with a separate Detailed Development Plan application. Maintenance of the required open space will be addressed with Parcel B's Detailed Development Plan.

9. For projects with a residential use component, the proposed general development plan includes a mix of residential uses such that no single residential use exceeds seventy-five percent of the total proposed units. The mix of residential uses shall provide variety of dwelling types and sizes that are integrated throughout the site, rather than isolated from one another, with smooth transitions between residential types including appropriate setbacks, landscaping or screening as necessary, while maintaining street and pedestrian connectivity between all residential uses. Tenancy (i.e. ownership versus rental) shall not be a consideration in determination of the mix of residential use. For the purposes of this section, residential uses include single-family detached, duplex, triplex, quadplex, townhouse, cottage cluster, and multi-family.

Finding: Complies with Condition. Development of Parcel B will be described in more detail with a separate Detailed Development Plan application. The multi-family units for Parcel B will include a mixture of unit sizes/configurations consistent with this code section.

17.65.060 - Detailed development plan.
A. Submittal Requirements.
1. A transportation impact study documenting the on- and off-site transportation impacts, as specified in OCMC 17.65.050.B.1.h.i. If such an analysis was submitted as part of the general development plan process, the scope of the report may be limited to any changes which have occurred during the interim and any information listed below which was not a part of the initial study.
The on-site portion of the analysis shall include the location, dimensions and names of all proposed streets, alleys, other public ways, sidewalks, bike routes and bikeways, pedestrian/bicycle access ways and other pedestrian and bicycle ways, transit streets and facilities, neighborhood activity centers, and easements on and within two hundred fifty feet of the boundaries of the site. The map shall identify existing subdivisions and development and un-subdivided or unpartitioned land ownerships adjacent to the proposed development site and show how existing streets, alleys, sidewalks, bike routes, pedestrian/bicycle access ways and utilities within two hundred fifty feet may be extended to and/or through the proposed development.
2. The location within the development and in the adjoining streets of existing and proposed sewers, water mains, culverts, drain pipes, underground electric, cable television and telephone distribution lines, gas lines, and the location of existing aerial electric, telephone and television cable lines, if any, to be relocated within the development.
3. For portions of the project that would otherwise be subject to site plan and design review, a site plan or plans, to scale, containing the required information identified in OCMC 17.62.040.

4. For residential portions of the project not otherwise subject to site plan and design review, a site plan or plans, to scale, showing the proposed land uses and densities, building locations, lot patterns, circulation patterns, and open space locations and uses.
5. Any other information the Community Development Director deems necessary to show that the proposed development will comply with all of the applicable Chapter 17 requirements.
B. Approval Criteria. The Community Development Director shall approve an application for detailed development plan approval only upon findings that:
1. All development standards and impact mitigation meet the requirements of the approved general development plan, including conditions of approval.
2. Any other applicable zoning regulations that are not addressed in the general development plan are met, unless an adjustment to those regulations has been applied for and is approved. The approval standards applicable to adjustments required as part of a master plan or planned unit development are contained in OCMC 17.65.070.
3. The detailed development plan conforms with the base zone standards, applicable residential design standards, and applicable standards contained in Chapters 17.62, 17.52, 16.12, and 16.08 unless adjusted as provided in OCMC 17.65.070

Finding: Complies. A Detailed Development Plan for the construction of a new public road and utilities has been submitted (MAS-25-002_GEO-25-007_NROD-25-012) concurrently with the Master Plan. The staff report will be part of the Planning Commission hearing and can be approved at the same time as the Master Plan. DDPs will be submitted for Parcels A, B, and D when the market is ready for their development.

17.65.070 - Adjustments to development standards.
A. Purpose. In order to implement the purpose of the City's master plan or planned unit development process, which is to foster the growth of major institutions, major residential, commercial or mixed-use development, and other large-scale development, while identifying and mitigating their impacts on surrounding properties and public infrastructure, an applicant may request one or more adjustments to the applicable development regulations as part of the master planning or planned unit development process, and are not required to go through the variance process pursuant to OCMC Chapter 17.60.
B. Procedure. Requests for adjustments shall be processed concurrently with a general development plan. An adjustment request at the detailed development plan review shall cause the detailed development plan to be reviewed as a Type III application.

Findings: Complies. The applicant has not identified any additional requirements needed beyond the Type III Parking adjustment found in OCMCM17.52 of the staff report. Any anticipated modification by the applicant can be processed through a Type II DDP process.

C. Regulations That May be Adjusted. Adjustments may be allowed for the following items:
1. Dimensional standards of the underlying zone of up to twenty percent, except the perimeter of the development shall meet the underlying zone's setbacks when adjacent to residentially zoned property.
2. Site plan and design standards.
3. Residential design standards.

4. Increase in allowed maximum residential density of up to ten percent.
5. Standards for land division approval.
6. Additional uses allowed with residential projects, or residential component of projects:
a. Notwithstanding the use provisions of the underlying zones, neighborhood commercial uses as defined in Chapter 17.24.020, including restaurants and eating and drinking establishments without a drive-through, retail trade, and services, are permitted on up to ten percent of the net developable area. The neighborhood commercial uses shall be planned and constructed so as to support and be compatible with the entire development and shall not alter the character of the surrounding area so as to substantially preclude, impair or limit the use of surrounding properties for the primary uses listed in the underlying district.
b. Public or private parks and playgrounds, community buildings and/or outdoor recreational facilities, such as swimming pools and tennis courts.
c. Indoor recreational facilities, such as racquetball or tennis courts, fitness centers or swimming pools.
d. Common public and private open space including trails.
e. Primary or accessory uses that are not identified as a permitted or conditional use in the underlying zone but which are defined in the code.

Findings: Complies. The applicant has not identified any additional requirements needed beyond the Type III Parking adjustment found in OCMCM17.52 of the staff report. Any anticipated modification by the applicant can be processed through a Type II DDP process.

D. Regulations That May Not be Adjusted. Adjustments are prohibited for the following items:
1. To allow a primary or accessory use that is not identified as a permitted, or conditional use in the underlying zone, with the exception of the additional uses permitted under OCMC 17.65.070.C.6 above;
2. To any regulation that contains the word "prohibited";
3. As an exception to a threshold review, such as a Type III review process; and
4. Minimum density for residential sites may not be reduced.

Finding: Complies. The applicant has not identified any additional requirements needed beyond the Type III Parking adjustment found in OCMCM17.52 of the staff report. Any anticipated modification by the applicant can be processed through a Type II DDP process.

E. Approval Criteria. A request for an adjustment to one or more applicable development regulations under this section shall be approved if the review body finds that the applicant has shown the following criteria to be met.
1. Granting the adjustment will equally or better meet the purpose of the regulation to be modified;
2. If more than one adjustment is being requested, the cumulative effect of the adjustments results in a project that is still consistent with the overall purpose of the zone;
3. City-designated Goal 5 resources are protected to the extent otherwise required by Title 17;
4. Any impacts resulting from the adjustment are mitigated such that the development does not create significant adverse impacts on adjacent properties;
5. If an environmental zone, the proposal has as few significant detrimental environmental impacts on the resource and resource values as is practicable; and

6. The proposed adjustment is consistent with the Oregon City Comprehensive Plan and a concept plan if applicable.

Finding: Complies. The applicant has applied for a separate Planning Commission parking adjustment under OCMC 17.52. Staff has analyzed the criteria and found that the applicant can meet the requirements, subject to the conditions of approval, which include enhanced landscaping at Molala Avenue and enhanced elements at the building on parcel A. Because the applicant separately applied and paid for the parking adjustment, staff have not included this as part of a Master Plan adjustment.

17.65.80 - Amendments to approved plans.

A. When Required. An amendment to an approved general development plan or detailed development plan is required for any use or development that is not in conformance with the applicable plan, as provided below. The approval criteria contained in OCMC 17.65.050 will apply to general development plan amendments, the approval criteria contained in OCMC 17.65.060 will apply to detailed development plan amendments. The thresholds and procedures for amendments are stated below.

B. Type III Procedure. Unless the approved general development plan or detailed development plan specifically provides differently, amendments to either plan that require a Type III procedure are:

1. A proposed expansion of the approved boundary;

2. A proposed reduction in the approved boundary that affects a condition of approval, or takes the site out of conformance, or further out of conformance, with a development standard;

3. Proposals that increase the amount, frequency, or scale of a use over ten percent of what was approved (examples include the number of students, patients or members; the number of helicopter flights; the number or size of special events; transportation impacts);

4. New uses not covered in the plan that will increase vehicle trips to the site greater than ten percent of the original amount approved;

5. Increases or decreases in overall floor area of development on the site or number of residential units of over ten percent;

6. A increase/decrease greater than ten percent in the amount of approved or required parking; and

7. Proposed uses or development which were reviewed, but were denied because they were found not to be in conformance with an approved plan.

C. Type II Procedure. Unless an approved plan specifically provides otherwise, amendments to a general development plan or detailed development plan not specifically stated in subsection B or D are processed through a Type II procedure.

D. Type I Procedure. Unless an approved plan specifically provides otherwise, the following amendments to a general development plan or detailed development plan shall be processed through a Type I procedure:

1. Accessory uses and structures that meet applicable development regulations;

2. Reconfiguration of approved parking or landscape designs that do not alter the points of ingress or egress, and do not change the number of parking spaces required, so long as the reconfiguration meets applicable development regulations; and

3. Structures for approved uses that do not exceed one thousand five hundred square feet in size and that meet applicable development regulations

Finding: Complies with Conditions. The applicant's proposed building layouts and sizes are subject to change during the DDP process and should not be viewed as amendments to the Master Plan unless the final size or scope of the buildings surpasses what was initially proposed or if additional conditions are specified in the Master Plan (such as minimum building size or transportation impacts). The final design will be assessed during the Type II Detailed Development Plan review. This means the applicant can build a smaller development as long as the design fulfills the approval criteria of the Detailed Development Plan. The project's overall floor area ratio (FAR) is 0.73, which exceeds the zone's minimum requirement. With each DDP application, the applicant must show how the proposal will meet or surpass the zone's minimum FAR of 0.25 for the entire site, including parcels A, B, and D.
17.65.090 - Regulations that apply.
An applicant is entitled to rely on land use regulations in effect on the date its general development plan application was initially submitted, pursuant to ORS 227.178(3), as that statute may be amended from time to time. After a general development plan is approved, and so long as that general development plan is in effect, an applicant is entitled to rely on the land use regulations in effect on the date its general development plan application was initially submitted, as provided above, when seeking approval of detailed development plans that implement an approved general development plan. At its option, an applicant may request that a detailed development plan be subject to the land use regulations in effect on the date its detailed development plan is initially submitted.

Finding: Compiles with condition. Per OCMC 17.65.020.A, unless further amended and extended by the Planning Commission, this Master Plan, which includes Tax Lots 3330, 3400, 3200, and 3201, shall control development on the site until March 23, 2046. Tax Lots 500, 501 and 602 are not part of the 20-year Master Plan but are included initially to allow for the DDP construction of the Public Road, which will connect with Beavercreek Road. Future DDP applications are to be processed as Type I or II review as directed by the Oregon City Municipal Code, and the applicant may choose to use either the 2025 code adopted at the time of the Master Plan Amendment submittal (June 27, 2025) or the current code.

RECOMMENDATION:
Based on the analysis and findings as described above, Staff concludes that the proposed development located at 1367 Molalla Ave, Oregon City, Oregon 97045, identified as Clackamas County Map 3-2E-06DB Tax 3-2E-05DB TL 3200, 3201, 3300, & 3400, 500, 501, 602, can meet the requirements as described in the Oregon City Municipal Code by complying with the Conditions of Approval provided in this report. Therefore, the Community Development Director recommends approval with conditions, based upon the findings and exhibits contained in this staff report.

BACKGROUND/NARRATIVE:

<u>Current Land-Use Action</u>

Pre-Application Conference:	April 22, 2025 (Appendix A)
Masterplan Application submittal:	June 27, 2025
Incomplete Notice:	July 24, 2025 (Appendix B)
Neighborhood Meeting:	October 7, 2025 (Appendix C)
Masterplan Resubmittal:	November 14, 2025 – Revised March 2, 2026 (Appendix D)
Project Plans:	November 14, 2025 – Revised March 2, 2026 (Appendix E)

Existing Conditions

The subject property is comprised of an assemblage of properties in the main development area which includes TL 3200, 3201, 3300, & 3400, Map 3 2E 05DB (On-Site) and a proposed public road through TL 500 & 501, Map 3 2E 05D (Off-site) that connects the on-site properties to Beavercreek Rd

The on-site properties are currently vacant and include a mixture of grasslands, scrub brush and scattered groves of trees, with more concentrated tree canopy along the north and south edges and in the southeast corner. The east side of the on-site properties extends into Newell Creek Canyon, is heavily forested, and lies within a geologic hazard area.

Past uses on TL 3200, 3201 and 3300 include a former wrecking yard whose operations started in 1953 and continued until late 2001 when the wrecking yard operations ceased. Environmental studies on these properties indicated low concentrations of petroleum hydrocarbons and/or metals in near surface and shallow soils, and that groundwater underlying the former wrecking yard was not impacted with contaminants of concern.

TL 3400 previously included a gas station and tavern in the vicinity of its southwest corner which has been removed. Environmental remediation occurred at the former gas station site and ODEQ issued a "No Further Action" letter indicating that ODEQ should be notified prior to installation of any groundwater supply wells and any construction or excavation in or around the former gas station pocket of contamination.

The on-site properties generally slope to the south with a portion of the west end of the site sloping to the southwest. The east end of the property includes a steep slope extending into Newell Creek Canyon and is heavily forested.

Proposed Project

The project proposes to develop the on-site properties into a mixed-use development via the Oregon City Masterplan process. Three parcels are proposed in addition to a public street extending from the existing signal at Molalla Ave through the on-site properties and through TL 500/501 to the existing signal at Beavercreek Rd. Uses on the parcels include an approximately 14,600 sf retail building on Parcel A that includes shops and a Quick Service Restaurant at the north end of the building, an approximately 208-unit multi-family residential component on Parcel B, and a Quick Service Restaurant on Parcel D. Parcel C is proposed as a public road through the site. The Quick Service Restaurants (Parcels A & D) include drive-through facilities, which require Conditional Use Approval. Parcels A and D will also seek an adjustment to the maximum parking ratio.

The project seeks Type III Masterplan General Development Plan approval and Type II Detailed Development Plan approval for the proposed public roadway and utility improvements through both the on- and off-site areas, and rough grading of the entire on-site area.

Overall phasing on the Masterplan includes the proposed public roadway and utility improvements as well as on-site rough grading in Phase 1. The remaining parcels are proposed as separate phases, though

their development will be market-driven and could be developed separately or simultaneously with each other.

Municipal Code Standards and Requirements: The following sections of the Oregon City Municipal Code are applicable to this land use approval:

Chapter 17.65 Master Plan
Chapter 17.52 Off-Street Parking and Loading- Parking
Chapter 17.28 MUC-2
Chapter 17.56 Conditional Use

Following are detailed code responses to all applicable code criteria for General Development Plan Approval as presented in this application:

DETAILED CODE RESPONSES

Table of Contents

CHAPTER 17.29 MUC MIXED USE CORRIDOR DISTRICT 6
CHAPTER 17.52 OFF-STREET PARKING AND LOADING 13
CHAPTER 17.56 CONDITIONAL USES 33
CHAPTER 17.65 MASTER PLANS AND PLANNED UNIT DEVELOPMENT 44

CHAPTER 17.29 MUC MIXED USE CORRIDOR DISTRICT

17.29.010 Designated.

The mixed-use corridor (MUC) district is designed to apply along selected sections of transportation corridors such as Molalla Avenue, 7th Street, Beavercreek Road, and along Warner-Milne Road. Land uses are characterized by high-volume establishments such as retail, service, office, multi-family residential, lodging, recreation and meeting facilities, or a similar use as defined by the Community Development Director. A mix of high-density residential, office, and small-scale retail uses are encouraged in this district. Moderate density (MUC-1) and high density (MUC-2) options are available within the MUC zoning district. The area along 7th Street is an example of MUC-1, and the area along Warner-Milne Road is an example of MUC-2.

17.29.020 - Permitted uses—MUC-1 and MUC-2.

A. Banquet, conference facilities and meeting rooms.
B. Bed and breakfast/boarding houses, hotels, motels, and other lodging facilities.
C. Child care centers and/or nursery schools.
D. Indoor entertainment centers and arcades.
E. Health and fitness clubs.
F. Medical and dental clinics, outpatient; infirmary services.
G. Museums, libraries and cultural facilities.
H. Offices, including finance, insurance, real estate and government.
I. Outdoor markets, such as produce stands, craft markets and farmers markets that are operated on the weekends and after six p.m. during the weekday.
J. Postal services.
K. Parks, playgrounds, playfields and community or neighborhood centers.
L. Repair shops, for radio and television, office equipment, bicycles, electronic equipment, shoes and small appliances and equipment.
M. Multi-family residential, triplexes and quadplexes.
N. One or two dwelling units in conjunction with a nonresidential use, provided that the residential use occupies no more than fifty percent of the total square footage of the development.
O. Restaurants, eating and drinking establishments without a drive-through.
P. Services, including personal, professional, educational and financial services; laundry and dry-cleaning.
Q. Retail trade, including grocery, hardware and gift shops, bakeries, delicatessens, florists, pharmacies, specialty stores, marijuana, and similar, provided the maximum footprint for a standalone building with a single store or multiple buildings with the same business does not exceed sixty thousand square feet.
R. Seasonal sales.
S. Residential care facilities, assisted living facilities; nursing homes and group homes for over fifteen patients licensed by the state.
T. Studios and galleries, including dance, art, photography, music and other arts.
U. Utilities: Basic and linear facilities, such as water, sewer, power, telephone, cable, electrical and natural gas lines, not including major facilities such as sewage and water treatment plants, pump stations, water tanks, telephone exchanges and cell towers.
V. Veterinary clinics or pet hospitals, pet day care.
W. Home occupations.
X. Research and development activities.

Y. Temporary real estate offices in model dwellings located on and limited to sales of real estate on a single piece of platted property upon which new residential buildings are being constructed.
Z. Transportation facilities.
AA. Live/work dwellings.
BB. Accessory dwelling unit in conjunction with a legally established non-conforming single-family dwelling.
CC. Duplex.
DD. After-hours public parking.

Applicant's Response:
The proposed development uses include multi-family residential (17.29.020.M), retail less than 60,000 sf in building area (17.29.020.Q), and restaurant uses (17.29.020.O). The restaurant use is approved in this zone; however, a drive-through is a conditional use. The conditional use is further described in subsequent responses. Seasonal sales are also a permitted use in this zone, which may arise from time to time on the retail pad.

17.29.030 - Conditional uses—MUC-1 and MUC-2 zones.
The following uses are permitted in this district when authorized and in accordance with the process and standards contained in OCMC 17.56:
A. Drive-through facilities;
B. Emergency service facilities (police and fire), excluding correctional facilities;
C. Gas stations;
D. Outdoor markets that do not meet the criteria of OCMC 17.29.020.I;
E. Public utilities and services including sub-stations (such as buildings, plants and other structures);
F. Public and/or private educational or training facilities;
G. Religious institutions;
H. Retail trade, including gift shops, bakeries, delicatessens, florists, pharmacies, specialty stores and any other use permitted in the neighborhood, historic or limited commercial districts that have a footprint for a standalone building with a single store in excess of sixty thousand square feet in the MUC-1 or MUC-2 zone;
I. Hospitals;
J. Parking not in conjunction with a primary use on private property, excluding after-hours public parking;
K. Passenger terminals, excluding bus stops;
L. Shelters.

Applicant's Response:
Both Parcels A and D include drive-throughs. A drive-through is a conditional use in the MUC-2 zone and will be reviewed by Planning Commission as a part of this project's General Development Plan process. Please see our responses to 17.56 Conditional Use later in this code response.

17.29.040 - Prohibited uses in the MUC-1 and MUC-2 zones.
The following uses are prohibited in the MUC district:
A. Distributing, wholesaling and warehousing;
B. Outdoor storage;
C. Outdoor sales that are not ancillary to a permitted use on the same or abutting property under the same ownership;
D. Correctional facilities;
E. Heavy equipment service, repair, sales, storage or rentals (including but not limited to construction equipment and machinery and farming equipment);
F. Kennels;
G. Motor vehicle and recreational vehicle sales and incidental service;
H. Motor vehicle and recreational vehicle repair/service;
I. Self-service storage facilities;
J. Marijuana production, processing, wholesaling, research, testing, and laboratories;
K. Mobile food units, except with a special event permit.

Applicant's Response:
The proposed uses for this project are either approved outright or will be reviewed as a conditional use, and do not fall within the prohibited uses identified in this section.

17.29.050 - Dimensional standards—MUC-1.
Applicant's Response:
The subject property lies within the MUC-2 zone. Accordingly, this section is not applicable.

17.29.060 - Dimensional standards—MUC-2.
A. Minimum lot area: None.

Applicant's Response:
Acknowledged.

B. Minimum floor area ratio: 0.25.

Applicant's Response:
The project's overall floor area ratio is 0.73, which exceeds the minimum requirement of this zone. Please our response to 17.29.070 for greater detail.

C. Minimum building height: Twenty-five feet or two stories except for accessory structures or buildings under one thousand square feet.

Applicant's Response:
Acknowledged. Each of the parcels will seek Detailed Development Plan approval following this General Development Plan decision and will elaborate more on their respective building heights in those applications; however, each of the buildings will be in compliance with this section.

D. Maximum building height: Sixty feet.

Acknowledged. Each of the parcels will seek Detailed Development Plan approval following this General Development Plan decision and will elaborate more on their respective building heights in those applications; however, each of the buildings will be in compliance with this section.

E. Minimum required setbacks if not abutting a residential zone: None.

Applicant's Response:
The project abuts residential zoning along the property's most northern boundary. Minimum setbacks for the residentially zone properties north of the property will be addressed below. The property abuts an adjacent MUC-2 zoned property at the most northwesterly corner of the site (adjacent Wendy's restaurant). The applicant acknowledges a zero setback along this adjacent property; however, the proposed retail building is located away from this adjacent property.

F. Minimum required interior and rear yard setbacks if abutting a residential zone: Twenty feet, plus one foot additional yard setback for every two feet of building height over thirty-five feet.

Applicant's Response:
The project abuts residential zoning along the property's most northern boundary (R-2 and R-10). Proposed buildings abutting this residentially zone property include Retail and Multi-Family Buildings.

- **Retail - This building is expected to be less than 35 feet tall, so no additional building setback is applied, and the minimum setback is 20 feet. The proposed retail building is located approximately 36 feet south of the northerly property line, which exceeds the minimum setback.**
- **Multi-Family – There are three multi-family buildings proposed on Parcel B, two of which are situated in the northern part of the site, while the third fronts the internal public street. The two northerly buildings are approximately 60 feet tall and result in a minimum building setback of 33 ft (60'-35' = 25'; 25' / 2 = 12.5', or 13'; min setback = 20' + 13' = 33'). These buildings are proposed to be approximately 93 feet south of the northerly property line, which exceeds the minimum setback.**

G. Maximum Allowed Setbacks.
1. Front yard: Five feet.

Applicant's Response:
Maximum building setbacks are exceeded with the Retail building on Parcel A and the Quick Service Restaurant building on Parcel D, which will be addressed via implementation of at least one of the nine design elements described in 17.62.055.D and described in more detail during the Detailed Development Plan applications for each of those parcels. The multi-family building which fronts the proposed internal street is set back slightly further away from the right-of-way to provide adequate sight distance at the entrance drive for the multi-family development. This will be further addressed during the Detailed Development Plan application for the multi-family parcel.

2. Interior side yard: None.

Applicant's Response:
Acknowledged. Each of the proposed buildings on the proposed parcels are set back from interior lot lines to reduce impact to adjacent properties.

3. Corner side yard abutting street: Twenty feet.

Applicant's Response:
Parcels A and D both abut Molalla Ave and the proposed public road. Accordingly, this criterion applies to both of these proposed parcels. Both Parcel A and D buildings are set back well beyond the twenty foot setback as can be seen by inspection of the General Development Plan Site Plan (see Sht GDP-C1.0).

4. Rear yard: None.

Applicant's Response:
Acknowledged. Each of the proposed buildings on the proposed parcels are set back from rear lot lines to reduce impact to adjacent properties. Please see our response to 17.29.060.F for further discussion of Multi-Family setback where it abuts a residential zone.
H. Maximum site coverage of building and parking lot: Ninety percent.

Applicant's Response:
Proposed Total Site Coverage for each of the parcels is shown below, subject to Detailed Development Plan approval for each parcel:

Parcel	Tot Parcel Area (sf)	Building & Parking Lot Area (sf)	Site Coverage (%)
A	85,346	74,500	87+/-
B	288,563	185,000	64+/-
D	87,773	55,000	63+/-

These values are approximate and show broad compliance with the criterion; however, each parcel will provide detailed information with their own Detailed Development Plan applications.

I. Minimum landscaping requirement (including parking lot): Ten percent.

Applicant's Response:
Proposed landscaping for each of the parcels is shown below, subject to Detailed Development Plan approval for each parcel:

Parcel	Tot Parcel Area (sf)	Proposed Landscape Area (sf)	Landscape Coverage (%)
A	85,346	11,000	13+/-
B	288,563	108,000	37+/-
D	87,773	34,000	39+/-

These values are approximate and show broad compliance with the criterion; however, each parcel will provide detailed information with their own Detailed Development Plan applications.

J. Residential minimum net density of 17.4 units per acre, except that no minimum net density shall apply to residential uses proposed above nonresidential uses in a mixed-use configuration or to live/work dwellings.

Applicant's Response:
Parcel B includes multi-family residential use with 208 total units. The total area of Parcel B is 288,617 sf. Of that total area, the area east of the geologic hazard area 35-ft setback line, building setback line along the north property line, the area covered by a PUE, and that area included within the proposed public sanitary sewer easement are excluded. The net developable area then becomes 199,641 sf or 4.58 acres, resulting in a net residential density of 45.3 units per acre, which exceeds the minimum density identified in this criterion.

17.29.070 - Floor area ratio (FAR).
Floor area ratios are a tool for regulating the intensity of development. Minimum FARs help to achieve more intensive forms of building development in areas appropriate for larger-scale buildings and higher residential densities.
A. The minimum floor area ratios contained in OCMC 17.29.050 and 17.29.060 apply to all nonresidential and mixed-use building development, except stand-alone commercial buildings less than ten thousand square feet in floor area.
B. Required minimum FARs shall be calculated on a project-by-project basis and may include multiple contiguous blocks. In mixed-use developments, residential floor space will be included in the calculations of floor area ratio to determine conformance with minimum FARs.
C. An individual phase of a project shall be permitted to develop below the required minimum floor area ratio provided the applicant demonstrates, through covenants applied to the remainder of the site or project or through other binding legal mechanism, that the required density for the project will be achieved at project build out.

Applicant's Response:
The minimum FAR for the MUC-2 zone is 0.25 per OCMC 17.29.060.B. The proposed project includes mixed use buildings consisting of multi-family residential, retail (including an in-line quick service restaurant), and a quick-service restaurant. Proposed FAR exceeds the minimum FAR required in this zone. Please see General Development Plan Sht FAR-EXH for FAR as proposed.

17.29.080 – Additional standards for Thimble Creek concept plan area.
A. Applicability. This section applies to all development in the MUC-2 district within the Thimble Creek Concept Plan Area.
B. Relationship of Standards. These standards apply in addition to and supersede the standards of the MUC-2 zone within the Thimble Creek Concept Plan Area. In the event of a conflict, the standards of this section control.
C. Uses.
1. Light industrial uses limited to the design, light manufacturing, processing, assembly, packaging, fabrication and treatment of products made from previously prepared or semi-finished materials are permitted.
2. The following permitted uses, alone or in combination, shall not exceed twenty percent of the total gross floor area of all of the other permitted and conditional uses within the development site. The total gross floor area of two or more buildings may be used, even if the buildings are not

all on the same parcel or owned by the same property owner, as long as they are part of the net developable portion of contiguous mixed-use corridor zoned lands.

a. Restaurants, eating and drinking establishments;

b. Services, including personal, professional, educational and financial services; laundry and drycleaning;

c. Retail trade, including grocery, hardware and gift shops, bakeries, delicatessens, florists, pharmacies, specialty stores, marijuana, and similar, provided the maximum footprint for a standalone building with a single store does not exceed twenty thousand square feet; and

d. Grocery stores provided the maximum footprint for a standalone building does not exceed forty thousand square feet.

3. Drive-throughs are prohibited.

4. Gas stations are prohibited.

5. Bed and breakfast and other lodging facilities for up to ten guests per night are a conditional use.

6. Tax Lot 00800, located on Clackamas County Map #32E10C has a special provision to allow the multifamily residential use permitted as of July 31, 2020 as a permitted use. This property may only maintain and expand the current use.

Applicant's Response:
The subject property is not located within the Thimble Creek concept plan area. Accordingly, these criteria are not applicable.

D. Dimensional Standards.

1. Minimum floor area ratio (FAR) shall be 0.35.

2. Maximum allowed setback for corner side yard abutting street shall be five feet.

Applicant's Response:
The subject property is not located within the Thimble Creek concept plan area. Accordingly, these criteria are not applicable.

E. Residential Uses. All residential uses, except live/work units, are limited to upper stories only, and may only be proposed as part of a single development application incorporating nonresidential uses allowed in the MUC-2 district on the ground floor.

Applicant's Response:
The subject property is not located within the Thimble Creek concept plan area. Accordingly, these criteria are not applicable.

CHAPTER 17.52 OFF-STREET PARKING AND LOADING

17.52.010 - Applicability.
The construction of a new structure or parking lot, or alterations to the size or use of an existing structure, parking lot or property use shall require site plan review approval and compliance with this chapter. This chapter does not apply to single-family attached, detached residential dwellings, duplexes, townhouses and cottage clusters.

Applicant's Response:
The applicant acknowledges the applicability of 17.52

17.52.015 - Planning commission adjustment of parking standards.
A. Purpose. The purpose of permitting a planning commission adjustment to parking standards is to provide for flexibility in modifying parking standards in all zoning districts, without permitting an adjustment that would adversely impact the surrounding or planned neighborhood. Adjustments provide flexibility to those uses which may be extraordinary, unique, or provide greater flexibility for areas that can accommodate a denser development pattern based on existing infrastructure and ability to access the site by means of walking, biking or transit. An adjustment to a minimum parking standard may be approved based on a determination by the planning commission that the adjustment is consistent with the purpose of this code, and the approval criteria can be met.

B. Procedure. A request for a planning commission parking adjustment shall be initiated by a property owner or authorized agent by filing a land use application. The application shall be accompanied by a site plan, drawn to scale, showing the dimensions and arrangement of the proposed development and parking plan, the extent of the adjustment requested along with findings for each applicable approval criteria. A request for a parking adjustment shall be processed as a Type III application as set forth in Chapter 17.50.

C. Approval criteria for the adjustment are as follows:

1. Documentation: The applicant shall document that the individual project will require an amount of parking that is different from that required after all applicable reductions have been taken.

Applicant's Response:
The applicant acknowledges the purpose and procedure for Planning Commission consideration of parking adjustments. While each parcel will seek their own individual Detailed Development Plan (DDP) approval, this Masterplan application seeks adjustment to the required parking criteria as shown below so that the individual parcel DDP applications will already have received a decision on anticipated parking counts.

Parcel	Proposed Use	Required Parking	Required Criteria	Proposed Parking	Parking Adj Needed?
A	Retail	55 (min); 68 (max)	4.10/1ksf (min); 5.00/1ksf (max)	102 (7.0/1ksf)	Yes
B	Multi-Family Residential	208 (min); 520 (max)	1.00/unit (min); 2.5/unit (max)	320	No
D	Restaurant	20 (min); 25 (max)	4.10/1ksf (min); 5.00/1ksf (max)	58 (11.8/1ksf)	Yes

2. Parking analysis for Surrounding Uses and on-street parking availability: The applicant shall show that there is a continued fifteen percent parking vacancy in the area adjacent to the use during peak parking periods and that the applicant has permission to occupy this area to serve the use pursuant to the procedures set forth by the Community Development Director.

a. For the purposes of demonstrating the availability of on street parking as defined in OCMC 17.52.020.B.3., the applicant shall undertake a parking study during time periods specified by the Community Development Director. The time periods shall include those during which the highest parking demand is anticipated by the proposed use. Multiple observations during multiple days shall be required. Distances are to be calculated as traversed by a pedestrian that utilizes sidewalks and legal crosswalks or an alternative manner as accepted by the Community Development Director.

Applicant's Response:
The above analysis requirement implies a request for a reduction in parking by evaluating surrounding parking availability, including on-street parking. This project's proposed parking adjustments are in excess of maximum required parking, rather than seeking a reduction in parking requirements due to on-street parking or shared parking from another use.

Oregon City Municipal Code (OCMC) Table 17.52.020 identifies parking requirements and groups retail stores, shopping centers, and restaurants in the same category and limits the maximum parking ratio to 5.0 per thousand square feet. It does not differentiate between sizes of uses or different types of uses within the three applicable uses described (for example: retail store vs grocery store or specialty retail; sit-down restaurants vs quick service restaurants that generate higher traffic/parking impacts; or larger regional shopping centers vs neighborhood shopping centers). As such, variations in use can have a significant impact on the number of required parking spaces for a given user that may not fit within the limits of Table 17.52.020.

<u>Parcel A Discussion:</u>
This project's proposed public street does not include on-street parking. Existing uses north of this parcel preclude shared parking by virtue of adjacent limited parking capacity of the existing QSR, and street connectivity to Hilltop Ave. Additionally, counting on-street parking from Hilltop Ave would preclude parking in front of these existing Hilltop uses by those same uses. There is no on-street parking on Molalla Ave. The shopping center on the west side of Molalla Ave is not likely to be utilized by Parcel A customers given the distance from the Parcel A building entrance and the need to cross Molalla Ave.

A maximum parking ratio of 5.0 may work for larger retail or shopping centers, but the proposed retail use is relatively small at 14,600 sf

The applicant seeks an increase in maximum parking as proposed in the above table. Parking ratios have varied between approximately 5.0 – 7.0 in similar combined retail shops/QSR uses. In locations where their parking ratios have been lower, parking has spilled over to adjacent shopping center parking to make up for demand at this retailer. With this project, the retail shops and QSR combination is a stand-alone location without the ability to share parking with another use or shopping center. If the parking ratio is limited to 5.0, customers would attempt to utilize adjacent parking from Parcel B, thereby reducing available parking for adjacent residential use. Customers may also attempt to utilize parking from Parcel D across the street, reducing available parking for Parcel D and creating an unsafe street crossing situation.

<u>Parcel D Discussion:</u>
Required parking for this proposed use is grouped with retail store and shopping center uses and does not recognize the parking demands of a quick service restaurant. Existing development north of the site is comprised of another Quick Service Restaurant (QSR) at the northeast corner of the subject property and single- and multi-family residential, with no connected access to these properties. The adjacent QSR is situated 4'-5' higher in elevation than the subject property and already has limited parking. The adjacent QSR parking ratio is approximately 12.5/1ksf, consistent with the project's requested parking ratio. The adjacent QSR, as with the proposed QSR, is a stand-alone restaurant and not part of a shopping center development where shared parking can occur. Our proposed QSR cannot share parking with other uses without crossing either a major arterial street (Molalla Ave) or our proposed Collector street, thus limiting practical shared parking opportunities. If the parking ratio is limited to 5.0, customers may attempt to utilize parking from Parcels A or B across the street, reducing available parking for these parcels and creating an unsafe street crossing situation.

The applicant seeks an increase in maximum parking as proposed in the above table. Based on other locations for this QSR, parking ratios have varied between approximately 12.6 – 20.0. In locations where their parking ratios have been the highest, parking was shared with adjacent development so identifying the exact parking count is difficult to do. This project does not seek an extreme parking ratio. Instead, it seeks a parking ratio consistent with adjacent uses in similar conditions. If the parking ratio is limited to 5.0, customers would attempt to utilize adjacent parking from Parcel B, thereby reducing available parking for adjacent residential use. Customers may also attempt to utilize parking from Parcel D across the street, reducing available parking for Parcel D and creating an unsafe street crossing situation.

b. The onsite parking requirements may be reduced based on the parking vacancy identified in the parking study. The amount of the reduction in onsite parking shall be calculated as follows:

i. Vacant on-street parking spaces within three hundred feet of the site will reduce onsite parking requirements by 0.5 parking spaces; and

ii. Vacant on-street parking spaces between three hundred and six hundred feet of the site will reduce onsite parking requirements by 0.2 parking spaces.

Applicant's Response:
The applicant does not seek a reduction in the minimum parking criterion. Parcels A and D seek an increase in maximum allowable parking. This criterion is not applicable.

3. Function and Use of Site: The applicant shall demonstrate that modifying the amount of required parking spaces will not significantly impact the use or function of the site and/or adjacent sites.

Applicant's Response:
As noted above, allowing an increase to the maximum allowed parking results in needed customer parking that does not depend on shared parking from adjacent uses that also need parking. Adjustments to the maximum allowable parking are requested for Parcels A and D. Each of these parcels have stand-alone parking lots where shared parking with another on-site use is not possible. Sharing parking with other uses within the proposed masterplan development would involve taking parking from the Parcel B residential use, which is not recommended, or requiring customers to cross a Collector road that separates Parcels A & D. Customers are not likely to park in the Parcel A parking lot, then travel to the Molalla Ave crosswalk then walk to the Parcel D building and vice versa (a travel distance of nearly 600 feet). Allowing an increase in maximum parking will not negatively impact the function and use of the proposed development. In fact, function and use of the development site are both supported by an increase in maximum parking so that customers from Parcels A and/or D do not consume parking from each other or from Parcel B that otherwise needed by those uses.

4. Compatibility: The proposal is compatible with the character, scale and existing or planned uses of the surrounding neighborhood.

Applicant's Response:
The subject property is considered infill development, as surrounding properties are already developed. The proposed increase in maximum allowable parking is compatible with surrounding uses which include comparably-parked adjacent QSR uses and shopping center parking.

5. Safety: The proposal does not significantly impact the safety of adjacent properties and rights-of-way.

Applicant's Response:
The proposed maximum parking adjustment results in a safer development proposal than one in which inadequate parking exists. As noted above, given the stand-alone nature of the subject parcels, any shared parking that may be necessary to satisfy the parking needs of Parcels A & D would result in taking parking away from adjacent residential use or require customers to cross a Collector street or Major Arterial to patron the subject uses.

6. Services: The proposal will not create a significant impact to public services, including fire and emergency services.

Applicant's Response:
The proposed increase to maximum allowable parking will have no negative impact on public services, including fire or emergency services. Additional space created by added parking allows more room for emergency services access and circulation within Parcels A and D. Public and private utility demands are unaffected by the requested parking increase.

17.52.020 - Number of automobile spaces required.

A. The number of parking spaces shall comply with the minimum and maximum standards listed in Table 17.52.020. The parking requirements are based on spaces per one thousand square feet net leasable area unless otherwise stated.

Table 17.52.020

LAND USE	***PARKING REQUIREMENTS***	
	MINIMUM	*MAXIMUM*
Multi-family Residential	*1 per unit*	*2.5 per unit*
Triplex and quadplex	*2*	*4*
Hotel, Motel	*1 per guest room*	*1.25 per guest room*
Correctional Institution	*1 per 7 beds*	*1 per 5 beds*
Senior housing, including congregate care, residential care and assisted living facilities; nursing homes and other types of group homes	*1 per 7 beds*	*1 per 5 beds*
Hospital	*2*	*4*
Preschool Nursery/Kindergarten	*2*	*3*
Elementary/Middle School	*1 per classroom*	*1 per classroom + 1 per administrative employee + 0.25 per seat in auditorium/assembly room/stadium*
High School, College, Commercial School for Adults	*0.20 per # staff and students*	*0.30 per # staff and students*
Auditorium, Meeting Room, Stadium, Religious Assembly Building, movie theater,	*.25 per seat*	*0.5 per seat*
Retail Store, Shopping Center, Restaurants	*4.10*	*5*
Office	*2.70*	*3.33*
Medical or Dental Clinic	*2.70*	*3.33*
Sports Club, Recreation Facilities	*Case Specific*	*5.40*
Storage Warehouse, Freight Terminal	*0.30*	*0.40*
Manufacturing, Wholesale Establishment	*1.60*	*1.67*
Light Industrial, Industrial Park	*1.3*	*1.60*

1. *Multiple Uses. In the event several uses occupy a single structure or parcel of land, the total requirements for off-street parking shall be the sum of the requirements of the several uses computed separately.*
2. *Requirements for types of buildings and uses not specifically listed herein shall be determined by the community development director, based upon the requirements of comparable uses listed.*
3. *Where calculation in accordance with the above list results in a fractional space, any fraction less than one-half shall be disregarded and any fraction of one-half or more shall require one space.*
4. *Fleet vehicle parking shall be accommodated within the maximum parking ratio, except that in GI, CI, and MUE zones, fleet vehicle parking may be included in a parking lot in addition to the maximum number of permitted parking spaces.*
5. *A change in use within an existing habitable building located in the MUD design district or the Willamette Falls Downtown District is exempt from additional parking requirements. Additions to an existing building and new construction are required to meet the minimum parking requirements for the areas as specified in Table 17.52.020 for the increased square footage.*

Applicant's Response:
The above parking requirements are acknowledged by the applicant, and a request to increase the allowable maximum parking for Parcels A and D are included in this application.

Parcel	Proposed Use	Required Parking	Required Criteria	Proposed Parking	Parking Adj Needed?
A	Retail	55 (min); 68 (max)	4.10/1ksf (min); 5.00/1ksf (max)	102 (7.0/1ksf)	Yes
B	Multi-Family Residential	208 (min); 520 (max)	1.00/unit (min); 2.5/unit (max)	320	No
D	Restaurant	20 (min); 25 (max)	4.10/1ksf (min); 5.00/1ksf (max)	58 (11.8/1ksf)	Yes

B. Parking requirements can be met either on-site, or off-site by meeting one or multiple of the following conditions:

1. Parking may be located on the same site as the associated use which it is supporting.
2. Mixed Uses. If more than one type of land use occupies a single structure or parcel of land, the total requirements for off-street automobile parking shall be the sum of the requirements for all uses, unless it can be shown that the peak parking demands are actually less (e.g. the uses operate on different days or at different times of the day). In that case, the total requirements shall be reduced accordingly, up to a maximum reduction of fifty percent, as determined by the community development director.
3. Shared Parking. Required parking facilities for two or more uses, structures, or parcels of land may be satisfied by the same parking facilities used jointly, to the extent that the owners or operators show that the need for parking facilities does not materially overlay (e.g., uses primarily of a daytime versus nighttime nature), that the shared parking facility is within one thousand feet of the potential uses, and provided that the right of joint use is evidenced by a recorded deed, lease, contract, or similar written instrument authorizing the joint use.
4. On-Street Parking. On-street parking may be counted toward the minimum standards when it is on the street face abutting the subject land use. An on-street parking space shall not obstruct a

required clear vision area and it shall not violate any law or street standard. On-street parking for commercial uses shall conform to the following standards:

a. Dimensions. The following constitutes one on-street parking space:

1. Parallel parking: Twenty-two feet of uninterrupted and available curb;
2. Forty-five and/or sixty-degree diagonal parking: Fifteen feet of curb;
3. Ninety-degree (perpendicular) parking: Twelve feet of curb.
4. Public Use Required for Credit. On-street parking spaces counted toward meeting the parking requirements of a specific use may not be used exclusively by that use, but shall be available for general public use at all times. Signs or other actions that limit general public use of on-street spaces are prohibited.

Applicant's Response:
Parking requirements are proposed to be met within each of the parcels proposed development area using parking stall geometry consistent with the geometry identified in the code. The Detailed Development Plan application for Parcels A, B, & D will address their individual parking proposals.

C. Reduction of the Number of the Minimum Automobile Spaces Required. Any combination of the reductions below is permitted unless otherwise noted.

1. Downtown Parking Overlay. The minimum required number of parking stalls is reduced within the downtown parking overlay by fifty percent.
2. Transit Oriented Development. For projects not located within the downtown parking overlay district, the minimum required number of parking stalls is reduced up to twenty-five percent when:
   a. In a commercial center (sixty thousand square feet or greater of retail or office use measured cumulatively within a five hundred foot radius);
   b. When adjacent to multi-family development with over eighty units; or
   c. Within one thousand three hundred twenty feet of an existing or planned public transit street and within one thousand three hundred twenty feet of the opposite use (commercial center or multi-family development with over eighty units).
3. Tree Preservation. The community development director may grant an adjustment to any standard of this requirement provided that the adjustment preserves a designated heritage tree or grove so that the reduction in the amount of required pavement can help preserve existing healthy trees in an undisturbed, natural condition.
4. Transportation Demand Management. The community development director shall reduce the required number of parking stalls up to twenty-five percent when a parking-traffic study prepared by a traffic engineer demonstrates alternative modes of transportation, including transit, bicycles, and walking, and/or special characteristics of the customer, client, employee or resident population will reduce expected vehicle use and parking space demand for this development, as compared to standard Institute of Transportation Engineers vehicle trip generation rates and further that the transportation demand management program promotes or achieves parking utilization lower than minimum city parking requirements.

   A transportation demand management (TDM) program shall be developed to include strategies for reducing vehicle use and parking demand generated by the development and will be measured annually. If, at the annual assessment, the city determines the plan is not successful, the plan may be revised. If the city determines that no good-faith effort has been made to implement the plan, the city may take enforcement actions.

5. The minimum required number of stalls may be reduced by up to ten percent when the subject property is adjacent to an existing or planned fixed public transit route or within one thousand feet of an existing or planned transit stop.

Applicant's Response:
The applicant does not request a reduction in allowable parking for any of the proposed parcels. The Detailed Development Plan application for Parcels A, B, & D will address their individual parking proposals.

17.52.030 - Standards for automobile parking.
A. Access. Ingress and egress locations on public thoroughfares shall be located in the interests of public traffic safety and meet requirements of OCMC 16.12.035. Groups of more than four parking spaces shall be so located and served by driveways so that their use will require no backing movements or other maneuvering within a street right-of-way other than an alley.

Applicant's Response:
As indicated in our response to OCMC 16.12.035, all proposed driveways meet the access spacing requirements identified in Table 16.12.035.A, with the exception of the easterly driveway for Parcel A and the westerly driveway for Parcel B. The separation between these two driveways measured at the right-of-way from curb-to-curb on the driveways is approximately 50.9 ft. With the pre-application notes prepared by Public Works indicating the proposed road was a Local Street, this driveway separation met the minimum 25-ft separation identified in the above table. However, subsequent to the pre-application notes Public Works increased the road classification to a Collector Street, which places the driveway spacing in conflict with Table 16.12.035.A.

The applicant wishes to keep the proposed driveways as shown on the proposed site layout (Shts DDP-C1.0 and GDP-C1.0 for the following reasons:

1. **Oregon Fire Code Appendix D106.2 and D106.3 require two access points for multi-family residential projects having more than 200 units and that they be separated by a distance not less than one-half of the length of the maximum overall diagonal dimension of the property (measured in a straight line between accesses). The maximum diagonal distance of Parcel B is 879 ft, resulting in a minimum driveway spacing of approximately 439 ft.**

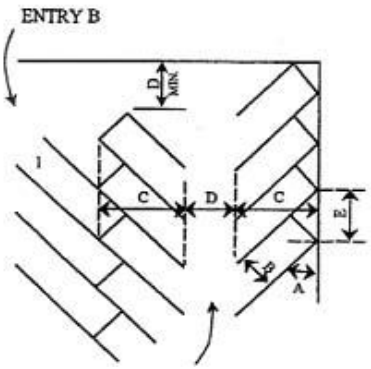
2. **Moving the Parcel B westerly driveway further east along the proposed public road to a distance of 439 ft from the easterly driveway results in splitting the current 70-unit building in two, reducing unit count while increasing building construction costs to a point where the multi-family development becomes unviable. Such a new driveway location would place it in the middle of the west diagonal leg of this building (see Sht GDP-C1.0 for building reference).**

B. Surfacing. Required off-street parking spaces and access aisles shall have paved surfaces adequately maintained. The use of pervious asphalt/concrete and alternative designs that reduce storm water runoff and improve water quality pursuant to the City's stormwater and low impact development design standards are encouraged.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

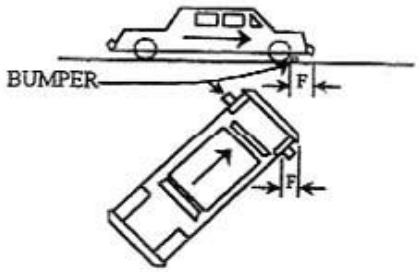
C. Drainage. Drainage shall be designed in accordance with the requirements of OCMC 13.12 and the City public works stormwater and grading design standards.

Applicant's Response:
The applicant acknowledges the drainage design standards for the proposed public street and utility improvements as well as the proposed rough grading associated with this DDP application. Please see the storm report accompanying this application and the Preliminary Civil Grading and Drainage Plan, Sht DDP-C2.0. Each of the parcels will provide their own separate design proposals with their own DDP applications.



D. Dimensional Standards.
1. Requirements for parking developed at varying angles are according to the table included in this section. A parking space shall not be less than seven feet in height when within a building or structure and shall have access by an all-weather surface to a street or alley. Parking stalls in compliance with the American with Disabilities Act may vary in size in order to comply with the building division requirements. Up to thirty-five percent of the minimum required parking may be compact, while the remaining required parking stalls are designed to standard dimensions. The Community Development Director may approve alternative dimensions for parking stalls in excess of the minimum requirement which comply with the intent of this chapter.

PARKING STANDARD / PARKING ANGLE SPACE DIMENSIONS



A ***Parking Angle***		***B*** ***Stall Width***	***C*** ***Stall to Curb***	***D*** ***Aisle Width***	***E*** ***Curb Length***	***F*** ***Overhang***
0 degrees		*8.5*	*9'*	*12'*	*20'*	*0*
30 degrees	*Standard* *Compact*	*9'* *8'*	*17.3'* *14.9'*	*11'* *11'*	*18'* *16'*	
45 degrees	*Standard* *Compact*	*8.5* *8.5*	*19.8'* *17'*	*13'* *13'*	*12.7'* *11.3'*	*1.4*
60 degrees	*Standard* *Compact*	*9'* *8'*	*21'* *17.9'*	*18'* *16'*	*10.4'* *9.2'*	*1.7*
90 degrees	*Standard* *Compact*	*9'* *8'*	*19'* *16'*	*24'* *22'*	*9'* *8'*	*1.5*

All dimensions are to the nearest tenth of a foot.

C:\Users\lterway\AppData\Local\Microsoft\Windows\INetCache\IE\images\17.52.030Typicalparkinglayout.

png
Typical Parking layout Entry A

Note: Space 1 Contingent upon Entry B overhang
Note: Overhang dimensions are intended to indicate possible location from parking area edge for location of bumpers.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

2. Alternative parking/plan. Any applicant may propose an alternative parking plan. Such plans are often proposed to address physically constrained or smaller sites, however innovative designs for larger sites may also be considered. In such situations, the Community Development Director may approve an alternative parking lot plan with variations to parking dimensions of this section. The alternative shall be consistent with the intent of this chapter and shall create a safe space for automobiles and pedestrians while providing landscaping to the quantity and quality found within parking lot landscaping requirements.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. While alternative parking plans are not anticipated on the parcels, each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

E. Carpool and Vanpool Parking. New developments with seventy-five or more parking spaces, excluding projects where seventy-five percent or more of the total floor area is residential , and new hospitals, government offices, group homes, nursing and retirement homes, schools and transit park-and-ride facilities with fifty or more parking spaces, shall identify the spaces available for employee, student and commuter parking and designate at least five percent, but not fewer than two, of those spaces for exclusive carpool and vanpool parking. Carpool and vanpool parking spaces shall be located closer to the main employee, student or commuter entrance than all other employee, student or commuter parking spaces with the exception of ADA accessible parking spaces. The carpool/vanpool spaces shall be clearly marked "Reserved - Carpool/Vanpool Only."

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

17.52.040 - Bicycle parking standards.
A. Purpose-Applicability. To encourage bicycle transportation to help reduce principal reliance on the automobile, and to ensure bicycle safety and security, bicycle parking shall be provided in conjunction with all uses other than exclusively residential use with less than five dwellings on-site (excluding cottage clusters).
B. Number of Bicycle Spaces Required. For any use not specifically mentioned in Table A, the bicycle parking requirements shall be the same as the use which, as determined by the Community Development Director, is most similar to the use not specifically mentioned. Calculation of the number of bicycle parking spaces required shall be determined in the manner established in OCMC 17.52.020 for determining automobile parking space requirements. Modifications to bicycle parking requirements may be made through the site plan and design, conditional use, or master plan review process.

*TABLE A Required Bicycle Parking Spaces**
Where two options for a requirement are provided, the option resulting in more bicycle parking applies. Where a calculation results in a fraction, the result is rounded up to the nearest whole number.

USE	***MINIMUM BICYCLE PARKING***	***MINIMUM BICYCLE PARKING - COVERED - The following percentage of bicycle parking is required to be covered***
Multi-family (five or more units)	*1 per 10 units (min of 2)*	*50% (min of 1)*
Correctional institution	*1 per 15 auto spaces (min of 2)*	*30% (min of 1)*
Nursing home or care facility	*1 per 30 auto spaces (min of 2)*	*30% (min of 1)*
Hospital	*1 per 20 auto spaces (min of 2)*	*30% (min of 1)*
Park-and-ride lot	*1 per 5 auto spaces (min of 2)*	*50% (min of 1)*
Transit center	*1 per 5 auto spaces (min of 2)*	*50% (min of 1)*

Parks and open space	*1 per 10 auto spaces (min of 2)*	*0%*
Public parking lots	*1 per 10 auto spaces (min of 2)*	*50% (min of 1)*
Automobile parking structures	*1 per 10 auto spaces (min of 4)*	*80% (min of 2)*
Religious institutions, movie theater, auditorium or meeting room	*1 per 10 auto spaces (min of 2)*	*30% (min of 1)*
Libraries, museums	*1 per 5 auto spaces (min of 2)*	*30% (min of 1)*
Preschool, nursery, kindergarten	*2 per classroom (min of 2)*	*50% (min of 1)*
Elementary	*4 per classroom (min of 2)*	*50% (min of 1)*
Junior high and High school	*2 per classroom (min of 2)*	*50% (min of 2)*
College, business/commercial schools	*2 per classroom (min of 2)*	*50% (min of 1)*
Swimming pools, gymnasiums, ball courts	*1 per 10 auto spaces (min of 2)*	*30% (min of 1)*
Retail stores and shopping centers	*1 per 20 auto spaces (min of 2)*	*50% (min of 2)*
Retail stores handling exclusively bulky merchandise such as automobile, boat or trailer sales or rental	*1 per 40 auto spaces (min of 2)*	*0%*
Bank, office	*1 per 20 auto spaces (min of 2)*	*50% (min of 1)*
Medical and dental clinic	*1 per 20 auto spaces (min of 2)*	*50% (min of 1)*
Eating and drinking establishment	*1 per 20 auto spaces (min of 2)*	*0%*
Gasoline service station	*1 per 10 auto spaces (min of 2)*	*0%*

** Covered bicycle parking is not required for developments with two or fewer parking stalls.*

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

C. Design Standards.

1. Bicycle parking facilities shall be in the form of a lockable enclosure onsite, secure room in a building onsite, a covered or uncovered rack onsite, or within the adjacent right-of-way.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

2. Bicycle parking areas shall be clearly marked or visible from on-site buildings or the street. If a bicycle parking area is not plainly visible from the street or main building entrance, a sign shall be posted indicating the location of the bicycle parking area. Indoor bicycle parking areas shall not require stairs to access the space. If sites have more than one building, bicycle parking shall be distributed as appropriate to serve all buildings.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

3. All bicycle racks shall be designed so that:
a. The bicycle frame is supported horizontally at two or more places.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

b. The frame and at least one wheel of the bicycle can be locked to the rack with a standard U-type lock.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

c. The user is not required to lift the bicycle onto the bicycle rack.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

d. Each bicycle parking space is accessible without moving another bicycle.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

e. It is a minimum of thirty inches tall and eighteen inches wide between the two points of contact.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

f. Provides an area of six feet by two feet per bicycle.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

g. All bicycle racks and lockers shall be securely anchored to the ground or to a structure.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

17.52.060 - Parking lot landscaping.
Purpose. The purpose of this code section includes the following:
1. To enhance and soften the appearance of parking lots;
2. To limit the visual impact of parking lots from sidewalks, streets and particularly from residential areas;
3. To shade and cool parking areas;
4. To reduce air and water pollution;
5. To reduce stormwater impacts and improve water quality; and
6. To establish parking lots that are more inviting to pedestrians and bicyclists.

A. Applicability. Unless otherwise specified, construction of new parking lots and alterations of existing parking lots shall comply with parking lot landscaping standards. Parking lot landscaping requirements within this section do not apply to parking structures or parking garages, except landscaping as required in OCMC 17.62.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

B. Development Standards.

1. The landscaping shall be located in defined landscaped areas that are uniformly distributed throughout the parking or loading area.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

2. All areas in a parking lot not used for parking, maneuvering, or circulation shall be landscaped.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

3. Parking lot trees shall be a mix of deciduous shade trees and coniferous trees. The trees shall be evenly distributed throughout the parking lot as both interior and perimeter landscaping.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

4. Required landscaping trees shall be of a minimum two-inch minimum caliper size (though it may not be standard for some tree types to be distinguished by caliper), planted according to American Nurseryman Standards, and selected from the Oregon City Street Tree List or approved by an arborist.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

5. At maturity, all of the landscaped area shall be planted in ground cover plants, which includes grasses. Mulch (as a ground cover) shall only be allowed underneath plants at full growth and within two feet of the base of a tree and is not a substitute for ground cover.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed

Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

6. Landscaped areas shall include irrigation systems unless an alternate plan is submitted, and approved by the Community Development Director, that can demonstrate adequate maintenance;

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

7. All landscaping shall be installed according to accepted planting procedures, according to American Nurseryman Standards.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

C. Perimeter Parking Lot Landscaping and Parking Lot Entryway/Right-of-Way Screening. Parking lots and associated drive aisles shall include a five-foot wide landscaped buffer where the parking lot abuts the right-of-way and/or adjoining properties. In order to provide connectivity between non-single-family sites, the Community Development Director may approve an interruption in the perimeter parking lot landscaping for a single driveway where the parking lot abuts property designated as multi-family, commercial or industrial. Shared driveways and parking aisles that straddle a lot line do not need to meet perimeter landscaping requirements.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

1. The perimeter parking lot are[a] shall include:
a. Trees spaced a maximum of thirty feet apart (minimum of one tree on either side of the entryway is required). When the parking lot is adjacent to a public right-of-way, the parking lot trees shall be offset from the street trees;

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

b. An evergreen hedge screen of thirty to forty-two inches high or shrubs spaced no more than four feet apart on average. The hedge/shrubs shall be parallel to and not nearer than two feet from the right-of-way line. The required screening shall be designed to allow for free access to the site and sidewalk by pedestrians. Visual breaks, no more than five feet in width, shall be provided every thirty feet within evergreen hedges abutting public right-of-ways.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

D. Parking Area/Building Buffer. Except for parking lots with fewer than five parking stalls, parking areas (excluding drive aisles with no adjacent parking) shall be separated from the exterior wall of a structure, exclusive of pedestrian entranceways or loading areas, by one of the following:

1. Minimum five-foot wide landscaped planter strip (excluding areas for pedestrian connection) meeting the standards for perimeter parking lot area landscaping; or:

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

2. Minimum seven foot sidewalks with shade trees spaced a maximum of thirty feet apart in three-foot by five-foot tree wells.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

E. Interior Parking Lot Landscaping. Surface parking lots with more than five parking stalls shall include at least forty-five square feet of interior parking lot landscaping per parking stall to improve the water quality, reduce storm water runoff, and provide pavement shade. Pedestrian walkways or any impervious surface in the landscaped areas are not to be counted in the percentage. Fractions shall be rounded up when calculating the required number of plantings. Interior parking lot landscaping shall include:

1. A minimum of one tree per four parking spaces.

Applicant's Response: This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their

own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

2. A minimum of 1.5 shrubs per parking space.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

3. No more than eight contiguous parking spaces shall be created without providing an interior landscape strip between them. Landscape strips shall be provided between rows of parking shall be a minimum of six feet in width and a minimum of ten feet in length.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

F. Alternative landscaping plan.
Any applicant may propose an alternative landscaping plan. Such plans are often proposed to address physically constrained or smaller sites, however innovative designs for larger sites may also be considered. Alternative plans may include the use of low impact development techniques and minimized landscaping requirements. In such situations, the Community Development Director may approve variations to the landscaping standards of OCMC 17.52.060 in accordance with 1 and/or 2 below.

1. General Review Standard. The alternative shall meet the standards in OCMC 17.62.015-Modifications that will better meet design review requirements.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

2. Credit for Pervious/Low Impact Development. The Community Development Director may count up to fifty percent of the square footage of any pervious hardscaped landscape material within a parking lot that is designed and approved pursuant to the City's adopted stormwater and low impact development design standards toward minimum landscaping requirements for the site. (This includes porous pavement detention, open celled block pavers, porous asphalt, porous concrete pavement, porous turf, porous gravel, etc.).

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed

Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

17.52.080 - Maintenance.

The owner, tenant and their agent, if any, shall be jointly and severally responsible for the maintenance of the site including but not limited to the off-street parking and loading spaces, bicycle parking and all landscaping which shall be maintained in good condition so as to present a healthy, neat and orderly appearance and shall be kept free from refuse and debris.
All plant growth in interior landscaped areas shall be controlled by pruning, trimming, or otherwise so that:
A. It will not interfere with the maintenance or repair of any public utility;
B. It will not restrict pedestrian or vehicular access; and
C. It will not constitute a traffic hazard due to reduced visibility.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

17.52.090 - Loading areas.

A. Purpose. The purpose of this section is to provide adequate loading areas for commercial, office, retail and industrial uses that do not interfere with the operation of adjacent streets.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

B. Applicability. OCMC 17.52.090 applies to uses that are expected to have service or delivery truck visits with a forty-foot or longer wheelbase, at a frequency of one or more vehicles per week. The City Engineer and decision maker shall determine through site plan and design review the number, size and location of required loading areas, if any.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

C. Standards.

1. The off-street loading space shall be large enough to accommodate the largest vehicle that is expected to serve the use without obstructing vehicles or pedestrian traffic on adjacent streets and driveways. Applicants are advised to provide complete and accurate information about the potential need for loading spaces because the City Engineer or decision maker may restrict the use

of other public right-of-way to ensure efficient loading areas and reduce interference with other uses.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

2. Where parking areas are prohibited between a building and the street, loading areas or drive isles are also prohibited.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

3. The City Engineer and decision maker, through site plan and design review, may approve a loading area adjacent to or within a street right-of-way when all of the following loading and unloading operations conditions are met:

a. Short in duration (i.e., less than one hour);
b. Infrequent (less than three operations daily between 5:00 a.m. and 12:00 a.m. or all operations between 12:00 a.m. and 5:00 a.m. at a location that is not adjacent to a residential zone);
c. Does not obstruct traffic during peak traffic hours;
d. Does not interfere with emergency response services; and
e. Is acceptable to the applicable roadway authority.

Applicant's Response:
This masterplan application seeks Detailed Development Plan approval for the proposed street and utility improvements and site rough grading. Each of the parcels will seek their own Detailed Development Plan approval separately from this masterplan application and will address the site/plan specific elements of this code section at that time.

CHAPTER 17.56 CONDITIONAL USES

17.56.010 - Permit—Authorization—Standards—Conditions.

A conditional use listed in this title may be permitted, enlarged or altered upon authorization of the Planning Commission in accordance with the standards and procedures of this title. A conditional use permit listed in this section may be permitted, enlarged or altered upon authorization of the Planning Commission or City Commission in accordance with the standards and procedures of this section. Any expansion to, alteration of, or accessory use to a conditional use shall require Planning Commission or City Commission approval of a modification to the original conditional use permit unless authorized in this chapter.

Applicant's Response:
The applicant acknowledges the responsibility of Planning Commission or City Commission in the Conditional Use review process.

A. Conditional uses, because of their public convenience and necessity and their effect upon the neighborhood shall be permitted only upon the approval of the Planning Commission or City Commission after due notice and public hearing, according to procedure as provided in OCMC 17.50. The applicant shall provide evidence substantiating that all the requirements of this title relative to the proposed use are satisfied, and demonstrate that the proposed use also satisfies the following criteria:

1. The use is listed as a conditional use in the underlying district;

Applicant's Response:
The proposed Masterplan includes a drive-through on both Parcels A and D which is identified as a Conditional Use in the MUC-2 zone (OCMC 17.29.030).

2. The characteristics of the site are suitable for the proposed use considering size, shape, location, topography, existence of improvements and natural features;

Applicant's Response:
The characteristics of the site are suitable for the proposed drive-through facilities as the proposed configuration of the drive-through facilities are designed in such a way that other site design code elements can still be maintained, drive-through facilities exist immediately north and west of the site, the proposed parcel size can easily accommodate the drive-through facilities and allow adequate queuing without impacting site circulation on public roads, and the site topography is gentle enough to accommodate the proposed drive-throughs while still allowing space for the access easement on Parcel D required for the properties south of the subject property as identified in the Beavercreek Access Management Plan.

3. Development shall demonstrate compliance with OCMC 16.12;

Applicant's Response:
Please see our responses to OCMC 16.12 in the Detailed Development Plan code responses.

4. The proposed use will not alter the character of the surrounding area in a manner which substantially limits, impairs or precludes the use of surrounding properties for the primary uses listed in the underlying district;

Applicant's Response:
Parcel A Drive-Through
The proposed drive-through is situated approximately 36' away from the north property line and approximately 60' – 90' away from the nearest residential use north of the subject property. The drive-through menu board and ordering speaker will be situated on the back (east) side of the building at least 50' south of the north edge of the Parcel A building. The Parcel A drive-through facility will not substantially limit, impair or preclude the continuing use of these residential properties. The proposed Parcel A drive-through facility is comparable in nature to the existing drive-through facility at the adjacent QSR at the northwest corner of the site, which is situated approximately 60' from the adjacent residential use, and will not substantially limit, impair or preclude the continuing operation of the existing QSR use.

Parcel D Drive-Through
The proposed drive-through is situated 350'-530' away from the nearest residential use north of the subject property and is separated by a proposed public street that has no direct connection to the abutting residential properties. The drive-through facility will not substantially limit, impair or preclude the continuing use of these residential properties. The proposed drive-through facility is comparable in nature to the existing drive-through facility at the adjacent QSR at the northwest corner of the site and will not substantially limit, impair or preclude the continuing operation of the existing QSR use.

The proposed drive-through facilities do not limit, impair or preclude uses in the existing shopping center west of the site. The proposed drive-through facilities are comparable in nature to several of the tenants in this shopping center who also have drive-through facilities. Similarly, the commercial uses south of the subject property are not impacted by the proposed drive-through use. Their uses can continue to operate regardless of the proposed drive-through use. In fact, the proposed drive-through lane is configured in a manner that allows future access to properties south of Parcel D in compliance with the Beavercreek Access Management Plan.

5. The proposal satisfies the goals and policies of the City comprehensive plan which apply to the proposed use.

Applicant's Response:
The following Comprehensive Plan Goals are applicable to the proposed drive-through conditional use:

HEALTHY AND WELCOMING COMMUNITIES
Goal 1 – Community Engagement
By virtue of the Conditional Use process before Planning Commission, Comprehensive Plan Goal 1 and its associated policies are satisfied. The proposed drive-through facilities are located in an area of the site with prior development activity (former gas station was located in this portion of the subject property).

Goal 2 – Historic, Artistic, and Cultural Resources

Based on coordination with the State Historic Preservation office (SHPO), SHPO has no record of identified archeological objects or sites and no Native American cairn, burial, human remains, sacred objects or objects of cultural patrimony in or adjacent to the project area and does not have any concerns with the project proceeding as planned. The Confederated Tribes of Grand Ronde requested an archeological survey of the site be performed. This survey will be performed prior to detailed construction plan preparation and the results of the survey incorporated into the design in the event they impact the proposed drive-through facility. Comprehensive Plan Goal 2 and its associated applicable policies are met.

Goal 3 – Livability and Access to Community Services

This goal is focused on community-based organizations, access to health care, civic engagement, community safety, and unhoused residents. Policy 3.4 describes the need to support and promote availability of affordable healthy food for neighborhoods and describes a strategy of allowing and encouraging the development of small retail centers in residential neighborhoods that provide goods and services for local residents and workers. The Comprehensive Plan identifies the subject property as Mixed Use Corridor (MUC). The proposed drive-through facilities do not impact access to community services. Restaurants are an allowed use in the Mixed Use Corridor (MUC) Plan District. The proposed drive-through supports the underlying Plan designation.

DIVERSE ECONOMY

Goal 1 – Varied Goods and Services and Employment Options

The proposed drive-through facilities do not negatively impact any of the stated Comprehensive Plan Policies. The proposed drive-through facilities allow an outright permitted use in this zone to operate in a manner that will bring them to the community and provide another food option.

Goal 2 – Housing Options

The proposed drive-through facilities do not impact this goal as they do not impact housing options.

Goal 3 – Implementation of 2040 Vision and Urban Growth Boundary

The proposed drive-through facilities are part of a development that lies within the Urban Growth Boundary and lies within a Comprehensive Plan designation that allows restaurants.

Goal 4 – Supportive Community Features and Sustainable Site/Building Design

The proposed drive-through facilities are part of a larger development that incorporates sustainable stormwater design and complies with applicable site and building code elements that have been adopted by the city and therefore have been deemed to satisfy this goal.

Goal 5 – Periodically Amend the Urban Growth Boundary

The proposed drive-through facilities do not impact this goal as they lie within the existing Urban Growth Boundary.

CONNECTED INFRASTRUCTURE

Goal 1 – Transportation Network Serving Multiple Modes of Travel

The proposed drive-through facilities do not negatively impact the goal of providing multiple modes of travel within the city. It focuses on the specific transportation impacts of the proposed masterplan development and will help support a safe and effective transportation network by being long enough to house drive-through traffic within the site and avoid spilling onto the proposed public street.

Goal 2 – Adequate Public Facilities
The proposed drive-through facilities do not negatively impact the goal of providing public utilities and transportation facilities within the city.

Goal 3 – Comprehensive Public Facilities
The proposed drive-through facilities do not negatively impact the goal of providing comprehensive public utilities facilities within the city. The proposed drive-through facility does not increase the demand for these services.

Goal 4 – Energy Conservation, Sustainability, and Resiliency
The proposed drive-through facilities will follow the same sustainable site improvements, including stormwater quality treatment and detention as the rest of the site improvements.

PROTECTED ENVIRONMENT
Goal 1 – Accessible Recreation
The proposed drive-through facilities will have no negative impact on the recreation opportunities within the city.

Goal 2 – Protection of Natural Resources
The proposed drive-through facilities will follow the same sustainable site improvements, including stormwater quality treatment and detention as the rest of the site improvements. Parcel D does not include protected natural resources or ecosystems.

Goal 3 – Minimize Impacts of Natural Hazards
The proposed drive-through facilities will have no impact on natural hazard events or the city's ability to respond to same.

Goal 4 – Willamette River Greenway
The proposed drive-through facilities have no impact to the Willamette River Greenway.

B. Permits for conditional uses shall stipulate restrictions or conditions which may include, but are not limited to, a definite time limit to meet such conditions, provisions for a front, side or rear yard greater than the minimum dimensional standards of the zoning ordinance, suitable landscaping, off-street parking, and any other reasonable restriction, condition or safeguard that would uphold the spirit and intent of the zoning ordinance, and mitigate adverse effect upon the neighborhood properties by reason of the use, extension, construction or alteration allowed as set forth in the findings of the Planning Commission.

Applicant's Response:
The applicant requests no time limit be set on approval of the drive-through facilities as considerable investment in drive-through infrastructure will be made and drive-through facilities are integral to the

QSR operations for both Parcels A and D. As proposed, the drive-through facilities already exceed minimum setback requirements for such improvements, and adverse impacts to neighborhood properties are not expected, given location and orientation of the Parcel A menu board and speaker, and the adjacent commercial uses south of the proposed Parcel D drive-through and the large distance separating the Parcel D drive-through facility from residential properties to the north of the proposed conditional use.

C. Any conditional use shall meet the dimensional standards of the zone in which it is to be located pursuant to subsection B. of this section unless otherwise indicated, as well as the minimum conditions listed below.

Applicant's Response:
The proposed drive-throughs are consistent with the applicable dimensional standards of the MUC-2 zone. Parking lot coverage identified in our response to the MUC-2 dimensional standards includes the proposed drive-through facility.

D. In the case of a use existing prior to the effective date of the ordinance codified in this title and classified in this title as a conditional use, any change of use expansion of lot area or expansion of structure shall conform with the requirements for conditional use.

Applicant's Response:
The proposed drive-through facilities are not a pre-existing use. Accordingly, this criterion is not applicable.

E. The Planning Commission may specifically permit, upon approval of a conditional use, further expansion to a specified maximum designated by the Planning Commission without the need to return for additional review.

Applicant's Response:
The applicant acknowledges the Planning Commission's authority to address further expansion of the proposed conditional use without the need for further review.

17.56.020 - Permit—Application.

A. A property owner or authorized agent shall initiate a request for a conditional use by filing an application with the City Recorder. The applicant shall submit a site plan, drawn to scale, showing the dimensions and arrangement of the proposed development. The application shall be accompanied by the filing fee listed in OCMC 17.50.080 to defray the costs of publication, investigation and processing.

Applicant's Response:
An application for Conditional Use Approval, together with the applicable review fee, was included in the overall Masterplan land-use application submitted June 27, 2025 (Ref CU-25-00001).

B. Before the Planning Commission or City Commission may act on a conditional use application, it shall hold a public hearing thereon, following procedure as established in OCMC 17.50.

Applicant's Response:
The applicant acknowledges the requirement for a public hearing for the requested conditional use approval.

17.56.025 - Minor modifications to legal conditional uses.
Minor modifications to an approved conditional use permit may be permitted. If permitted, the modification shall be reviewed as a minor site plan and design review. A minor modification to an approved conditional use permit is considered one of the following:

A. Modification to a structure for the purpose of enhancing the aesthetics of the building and there is no increase in the interior usable space;

Applicant's Response:
The applicant acknowledges the requirements to modify a conditional use. The proposed drive-through facilities included in this masterplan application is the initial request. If subsequent modifications are desired, the applicant will seek the applicable procedure for such modification.

B. Except for shelters, a maximum addition of up to one thousand square feet to a commercial, office, institutional, public, multi-family, or industrial building provided that the addition is not more than thirty-five percent of the original building square footage; or

Applicant's Response:
The applicant acknowledges the requirements to modify a conditional use. The proposed drive-through facilities included in this masterplan application is the initial request. If subsequent modifications are desired, the applicant will seek the applicable procedure for such modification.

C. Revisions to parking alignment and/or related vehicle circulation patterns.

Applicant's Response:
The applicant acknowledges the requirements to modify a conditional use. The proposed drive-through facilities included in this masterplan application is the initial request. If subsequent modifications are desired, the applicant will seek the applicable procedure for such modification.

17.56.040 - Criteria and standards for conditional uses.
In addition to the standards listed herein in OCMC 17.56.010, which are to be considered in the approval of all conditional uses and the standards of the zone in which the conditional use is located, the following additional standards shall be applicable:

A. Building Openings. The City may limit or prohibit building openings within fifty feet of residential property in a residential zone if the openings will cause glare, excessive noise or excessive traffic which would adversely affect adjacent residential property as set forth in the findings of the Planning Commission.

Applicant's Response:
Parcel A Drive-Through
The proposed drive-through is situated approximately 36' away from the north property line and approximately 60' – 90' away from the nearest residential use north of the subject property. The drive-through menu board and ordering speaker will be situated on the back (east) side of the building at least 50' south of the north edge of the Parcel A building. The Parcel A drive-through facility will not substantially limit, impair or preclude the continuing use of these residential properties. The proposed Parcel A drive-through facility is comparable in nature to the existing drive-through facility at the adjacent QSR at the northwest corner of the site, which is situated approximately 60' from the adjacent residential use.

Parcel D Drive-Through
The proposed drive-through facility includes a drive-through window on the southerly side of the proposed building. The drive-through window is located more than 225 ft away from the existing MUC-2 property south of the site. No additional building openings are proposed with this drive-through facility. The proposed drive-through facility is expected to include a secondary canopy near the approximate mid-point of the dual drive-through lanes. This canopy is located more than 80 ft away from the existing MUC-2 property to the south of the site. This canopy – as with the rest of the Parcel D improvements - will be further presented/described in the Parcel D Detailed Development Plan.

B. Additional Street Right-of-Way. The dedication of additional right-of-way may be required where the City plan indicates need for increased width and where the street is inadequate for its use; or where the nature of the proposed development warrants increased street width.

Applicant's Response:
The proposed drive-through facilities do not require any additional street right-of-way, and are contained entirely on-site without impacting the proposed Collector street.

C. Public Utility or Communication Facility. Such facilities as a utility substation, water storage tank, radio or television transmitter, tower, tank, power transformer, pumping station and similar structures shall be located, designed and installed with suitable regard for aesthetic values. The base of these facilities shall not be located closer to the property line than a distance equal to the height of the structure. Hydroelectric generation facilities shall not exceed ninety megawatts of generation capacity.

Applicant's Response:
The proposed drive-through facilities are not utility or communications facilities. Accordingly, this criterion is not applicable.

D. Schools. The site shall be located to best serve the intended area, shall be in conformance with the City plan, shall have adequate access, and shall be in accordance with appropriate State standards.

Applicant's Response:
The proposed drive-through facilities are not a school. Accordingly, this criterion is not applicable.

E. Helipad Landing Facility.

1. Size of runways and landing areas;
2. Approaches and obstructions within the runways and landing areas;
3. Fencing and/or screening to provide visual and noise buffering and to deflect winds or blast due to aircraft operation;
4. Fire protection measures and equipment;
5. Night illumination adequate for operations, and its effects upon surrounding property;
6. Landing markers;
7. Structural adequacy of runways, pads and other structures;
8. Paving and ground cover materials in relation to noise and down wash.

Applicant's Response:
The proposed drive-through facilities are not a helipad landing facility. Accordingly, this criterion is not applicable.

F. Residential Care Facilities.

1. In addition to the general provisions of OCMC 17.56.020, any application shall include a description of the proposed use, including the number of residents and the nature of the condition or circumstances for which care, or a planned treatment or training program will be provided, the number of staff and the estimated length of stay per resident and the name of the agency responsible for regulating or sponsoring the use.

Applicant's Response:
The proposed drive-through facilities are not residential care facilities. Accordingly, this criterion is not applicable.

2. Approval of a conditional use application for a residential care facility shall include the following minimum standards where applicable:

a. The proposed facility shall maintain all applicable licenses required by the appropriate agencies for the use described in the application.

Applicant's Response:
The proposed drive-through facilities are not residential care facilities. Accordingly, this criterion is not applicable.

b. All residential care facilities shall be subject to design review. Special considerations for this use are:

i. Compatibility in appearance with the surrounding area;

Applicant's Response:
The proposed drive-through facilities are not residential care facilities. Accordingly, this criterion is not applicable.

ii. Provisions of usable on-site open space appropriate to the needs of the residents and the nature of the care, treatment or training provided;

Applicant's Response:
The proposed drive-through facilities are not residential care facilities. Accordingly, this criterion is not applicable.

iii. Clearly defined property boundaries.

Applicant's Response:
The proposed drive-through facilities are not residential care facilities. Accordingly, this criterion is not applicable.

G. Bed and Breakfast Inns.

1. The bed and breakfast inn shall maintain all applicable licenses required by governmental agencies for the use described in the application.

Applicant's Response:
The proposed drive-through facilities are not bed and breakfast inns. Accordingly, this criterion is not applicable.

2. All bed and breakfast inns shall be subject to design review. Special considerations for this use are:

a. Compatibility of the structure in appearance with the surrounding area;

Applicant's Response:
The proposed drive-through facilities are not bed and breakfast inns. Accordingly, this criterion is not applicable.

b. Compatibility of the parking facilities in appearance and circulation of traffic with the surrounding area. Parking facilities shall also comply with Chapter 17.52;

Applicant's Response:
The proposed drive-through facilities are not bed and breakfast inns. Accordingly, this criterion is not applicable.

c. Compatibility of the signage in appearance with the surrounding area. Signage shall also comply with Chapter 15.28;

Applicant's Response:
The proposed drive-through facilities are not bed and breakfast inns. Accordingly, this criterion is not applicable.

d. The number of rooms to be used as overnight public accommodations shall not exceed four rooms in an underlying residential zone, or seven rooms in an underlying nonresidential zone;

Applicant's Response:
The proposed drive-through facilities are not bed and breakfast inns. Accordingly, this criterion is not applicable.

e. The owner/operators shall reside in the bed and breakfast inn, or in a residence adjacent to the bed and breakfast inn; and

Applicant's Response:
The proposed drive-through facilities are not bed and breakfast inns. Accordingly, this criterion is not applicable.

f. The Planning Commission may allow up to an additional six non-guests to be served along with the guests at a meal.

Applicant's Response:
The proposed drive-through facilities are not bed and breakfast inns. Accordingly, this criterion is not applicable.

H. Shelters.

1. Shelters shall be processed as a Type IV review.

Applicant's Response:
The proposed drive-through facilities are not shelters. Accordingly, this criterion is not applicable.

2. The shelter shall maintain a written community engagement plan include the following information:

a. Description of purpose and scope of services of the shelter;
b. Population to be housed at the shelter and the process and criteria for the selection of guests;
c. Bed capacity for nightly guests;
d. Hours of operations and curfew, if applicable;
e. 24 hour contact information; and
f. Explanation of how the shelter will address concerns/complaints.

Applicant's Response:
The proposed drive-through facilities are not shelters. Accordingly, this criterion is not applicable.

3. Shelters shall hold a meeting with the community prior to commencing operation, and a minimum of once a year each year thereafter. The purpose of the meeting is to discuss the community engagement plan and provide an opportunity for greater communication. Mailed notice of the meeting shall be provided to property owners within 300 feet, the neighborhood association, and the City. The meeting shall be open to the public.

Applicant's Response:
The proposed drive-through facilities are not shelters. Accordingly, this criterion is not applicable.

17.56.060 - Revocation of conditional use permits.

The Planning Commission or the City Commission may initiate administrative action under Chapter 17.50 to revoke any conditional use permit previously issued by the City or, with regard to lands annexed by the City, those such permits issued by the county. The Planning Commission or the City Commission, may revoke such permit upon determining:

A. One or more conditions attached to the grant of the conditional use permit have not been fulfilled; and

B. The unfulfilled condition is substantially related to the issuance of the conditional use permit.

Applicant's Response:
The applicant acknowledges the ability of Planning Commission or City Commission to revoke a conditional use approval.

17.56.070 - Periodic review of conditional use permits.

A. The City Commission may provide for the periodic review of some or all of the conditional use permits previously issued by the City, or, with regard to lands annexed by the City, those such permits issued by the county. In providing for such review, the City Commission may designate classes of such previously issued permits for which periodic review shall be undertaken.

B. Such review shall be accomplished as an administrative action under Chapter 17.50 and shall be limited to the question of whether additional conditions should be imposed on a conditional use in the light of changing circumstances and more efficient implementation of the City's comprehensive plan.

C. Notwithstanding the provisions of Chapter 17.58, any additional conditions shall be met as a requirement for continued operation of the conditional use.

Applicant's Response:
The applicant acknowledges the periodic review authority of City Commission for review of conditional use approvals.

CHAPTER 17.65 MASTER PLANS AND PLANNED UNIT DEVELOPMENT

17.65.010 Purpose and intent.

It is the intent of this chapter to foster the growth of major institutions, phased residential, commercial or mixed-use development, and other large-scale development, while identifying and mitigating the impacts of such growth on surrounding properties and public infrastructure. The City recognizes the valuable housing options, services and/or employment opportunities that these developments bring to Oregon City residents. The master plan or planned unit development process is intended to facilitate an efficient and flexible review process for major developments, support innovative and creative land development, and to provide long-term assurance to plan for and execute developments in a phased manner. To facilitate this, the master plan process is structured to allow an applicant to address larger development issues, such as adequacy of infrastructure and transportation capacity, and reserve capacity of the infrastructure and transportation system before expenditure of final design costs. The master plan or planned unit development process is further intended to promote efficiency in land development, maintenance, street systems and utility networks while providing site layouts that integrate usable and attractive open spaces, site circulation, and the general wellbeing of site users. For the purposes of this chapter planned unit developments are considered the same as master plans.

Applicant's Response:
The applicant acknowledges the purpose and intent of the masterplan process and chooses to request General Development Plan approval for the overall property and Detailed Development Plan approval for the proposed street improvements and rough grading of the site. Detailed Development Plan approval for Parcels A, B & D will be sought separately from this application.

17.65.020 What is included in a master plan or planned unit development.

A. A master plan or planned unit development is a two-step process that includes a general development plan and a detailed development plan. A general development plan incorporates the entire area where development is planned for up to the next twenty years from the date of final approval, including the identification of one or more development phases. The general development plan may encompass land that is not currently under the applicant's control, but which eventually may be controlled by the applicant during the duration of the master plan. The plan shall have no effect for lands not currently controlled by the applicant. "Controlled" shall be defined as leased or owned by the applicant. A detailed development plan is the phase or phases of the general development plan that are proposed for development within two years.

B. A master plan or planned unit development identifies the current and proposed uses of the development, proposed project boundaries, and proposed public and private infrastructure needed to serve the development. If approved, the general development plan may be used to allow existing legal non-conforming uses. If conditions of approval from a previous land use decision have not been completed, they shall be modified through the general development plan or completed with new development.

C. A master plan or planned unit development identifies future development impacts, thresholds for mitigation and mitigation improvements and implementation schedules. A threshold for mitigation is the

point that determines when or where a mitigation improvement will be required. Examples of "thresholds" include vehicle trips, square feet of impervious surface area, water usage measured in gallons per minute, construction of a building within a general development plan and construction of a building within a certain distance of a residential lot.

Mitigation improvements are necessary when a threshold for mitigation is reached. Examples include road dedication, intersection improvement, road widening, construction of a stormwater or water quality facility, installation of vegetative buffering and wetland restoration or enhancement.

Applicant's Response:
The applicant acknowledges the masterplan process.

17.65.030 - Applicability of the Master Plan or Planned Unit Development Regulations.
A. Required for Large Institutional Uses. If the boundaries of an institutional development exceed ten acres in size, the proposed development shall be master planned using the regulations of this chapter. No land use review other than a Type I or II Minor Site Plan and Design Review shall be issued for any institutional development in excess of ten acres in total acreage unless it is accompanied by or preceded by a master plan approval under this chapter. This requirement does not apply to modifications to existing institutional developments unless the modification results in a cumulative square footage increase of over ten thousand total building square feet in an existing institutional development over ten acres.

B. When Required as Part of Previous Land Use Review. The master plan or planned unit development regulations may be used to fulfill a condition of approval from a previous land use decision-requiring master planning for a development.

C. When identified in the Oregon City Comprehensive Plan. The master plan regulations are required for all properties identified for master planning in the land use section of the Oregon City Comprehensive Plan.

D. Voluntarily. An applicant may voluntarily submit a master plan or planned unit development as part of a land use review, including for residential projects.

Applicant's Response:
The applicant voluntarily requests General Development Plan approval for the overall property and Detailed Development Plan approval for the proposed street and utility main improvements and rough grading of the site. Detailed Development Plan approval for Parcels A, B & D will be sought separately from this application.

17.65.040 - Procedure.
A. Preapplication Review. Prior to filing for either general development plan or detailed development plan approval, the applicant shall file a pre-application conference pursuant to OCMC 17.50.030.

Applicant's Response:
A pre-application conference was held April 22, 2025.

B. General Development Plan. An application for a general development plan describing the long-term buildout of the site shall be reviewed through a Type III procedure. An applicant shall have an approved general development plan before any detailed development plan may be approved unless both are approved or amended concurrently. Amendments to an approved general development plan shall be reviewed under a Type III procedure pursuant to OCMC 17.65.080.

Applicant's Response:
An application for Masterplan General Development Plan and Detailed Development Plan, together with Lot Line Adjustment, Geologic Hazard Overlay, Conditional Use, Parking Adjustment, and Natural Resource (NROD) Review, was submitted June 27, 2025. The application was deemed incomplete on July 24, 2025. This land-use application package is submitted in response to the July 24, 2025 incomplete letter.

C. Detailed Development Plan. An application for a detailed development plan, is processed through a Type II procedure, as long as it is in conformance with the approved general development plan. Amendments to an approved detailed development plan shall be processed pursuant to OCMC 17.65.080. Once a development has an approved detailed development plan, OCMC 17.62 Site Plan and Design Review is not required.

Applicant's Response:
The applicant seeks Detailed Development Plan approval for the proposed street improvements and rough grading of the site. Detailed Development Plan approval for Parcels A, B & D will be sought separately from this application.

D. Concurrent Review. An applicant may concurrently apply for a general development plan and a detailed development plan. Such a concurrent application is reviewed through the highest procedure that applies to any element of the combined application.

Applicant's Response:
The applicant requests concurrent General Development Plan approval for the overall property and Detailed Development Plan approval for the proposed street and utility main improvements and rough grading of the site. Detailed Development Plan approval for Parcels A, B & D will be sought separately from this application.

E. Relationship to Other Reviews. It is the express policy of the City that development review not be segmented into discrete parts in a manner that precludes a comprehensive review of the entire development and its cumulative impacts.

Applicant's Response:
The applicant presents the enclosed application packages for comprehensive review of the entire development and its cumulative impacts.

F. Duration of General Development Plan. A general development plan shall involve a planning period of up to twenty years. An approved general development plan shall remain in effect until development allowed by the plan has been completed through the detailed development plan process, the plan is

amended or superseded, or the plan expires under its stated expiration date either as stated in the approved master plan or planned unit development application or decision of approval.

Applicant's Response:
The applicant acknowledges the planning period of up to twenty years for the requested masterplan approval.

17.65.050 - General Development Plan.

A. Existing Conditions Submittal Requirements.

1. Narrative Statement. An applicant shall submit a narrative statement that describes the following:

a. Current uses of and development on the site;

b. For institutions, history or background information about the mission and operational characteristics of the institution that may be helpful in the evaluation of the general development plan, and information about current programs or services;

c. A vicinity map showing the location of the general development plan boundary relative to the larger community, along with affected major transportation routes, transit, and parking facilities. At least one copy of the vicinity map shall be eight and one-half inches by eleven inches in size, and black and white reproducible;

d. Land uses that surround the development site. This may also reference submitted maps, diagrams or photographs;

e. Previous land use approvals within the general development plan boundary and related conditions of approval, if applicable;

f. Existing utilization of the site;

g. Site description, including the following items. May also reference submitted maps, diagrams or photographs:

i. Physical characteristics;

ii. Ownership patterns;

iii. Building inventory;

iv. Vehicle/bicycle parking;

v. Landscaping/usable open space;

vi. FAR/lot coverage;

vii. Natural resources that appear on the City's adopted Goal 5 inventory;

viii. Cultural/historic resources that appear on the City's adopted Goal 5 inventory;

ix. Location of existing trees six inches in diameter or greater when measured four feet above the ground. The location of single trees shall be shown. Trees within groves may be clustered together rather than shown individually; and

x. Geologic hazards pursuant to OCMC 17.44.

h. Existing transportation analysis, including the following items. May also reference submitted maps, diagrams or photographs.

i. Existing transportation facilities, including highways, local streets and street classifications, and pedestrian and bicycle access points and ways;

ii. Transit routes, facilities and availability;

iii. Alternative modes utilization, including shuttle buses and carpool programs; and

iv. Baseline parking demand and supply study (may be appended to application or waived if not applicable).

i. Infrastructure facilities and capacity, including the following items:
i. Water;
ii. Sanitary sewer;
iii. Stormwater management; and
iv. Easements.

Applicant's Response:
Please see the narrative included with this application which addresses the above narrative requirements. The narrative includes references to various reports and project plan sheets.

2. Maps and Plans.
a. Existing conditions site plan. Drawn at a minimum scale of one-inch equals one hundred feet (one inch equals one hundred feet) that shows the following items. At least one copy shall be eight and one-half inches x eleven inches in size, and black and white reproducible.
i. Date, north point, and scale of drawing.
ii. Identification of the drawing as an existing conditions site plan.
iii. Proposed development boundary.
iv. All parking, circulation, loading and service areas, including locations of all carpool, vanpool and bicycle parking spaces as required in Chapter 52 of this title.
v. Contour lines at two-foot contour intervals for grades zero to ten percent, and five-foot intervals for grades over ten percent.
b. A site plan or plans, to scale, for the general development plan site and surrounding properties containing the required information identified in OCMC 17.62.040.b, Vicinity map. Depicting the location of the site sufficient to define its location, including identification of nearest cross streets. At least one copy of the vicinity map shall be eight and one-half inches by eleven inches in size, and black and white reproducible.
c. Aerial photo. Depicting the subject site and property within two hundred fifty feet of the proposed development boundaries. At least one copy of the aerial photo shall be eight and one half inches by eleven in size, and black and white reproducible.

Applicant's Response:
Please see the existing conditions plan and proposed General Development Plan maps accompanying this application.

B. Proposed Development Submittal Requirements.
1. Narrative statement. An applicant shall submit a narrative statement that describes the following:
a. The proposed duration of the general development plan.
b. The proposed development boundary. May also reference submitted maps or diagrams.
c. A description, approximate location, and timing of each proposed phase of development, and a statement specifying the phase or phases for which approval is sought under the current application. May also reference submitted maps or diagrams.
d. An explanation of how the proposed development is consistent with the purposes of Section 17.65, the applicable zone district or districts, and any applicable overlay district.

e. A statement describing the impacts of the proposed development on inventoried Goal 5 natural, historic or cultural resources within the development boundary or within two hundred fifty feet of the proposed development boundary.

f. An analysis of the impacts of the proposed development on the surrounding community and neighborhood, including:

i. Transportation impacts as prescribed in subsection g below;

ii. Internal parking and circulation impacts and connectivity to sites adjacent to the development boundary and public right-of-ways within two hundred fifty feet of the development boundary;

iii. Public facilities impacts (sanitary sewer, water and stormwater management) both within the development boundary and on City-wide systems; including a phasing plan for all onsite and off-site public improvements, including but not limited to transportation, schools, parks, open space, trails, sewer, water and stormwater, with an analysis off the capacity and improvements required as a result of fully implementing the plan. This analysis shall reference any adopted parks and recreation, public facilities plans and concept plans and identify specific funding mechanisms to address the adequacy of public facilities.

iv. Neighborhood livability impacts;

v. Natural, cultural and historical resource impacts within the development boundary and within two hundred fifty feet of the development boundary.

g. A summary statement describing the anticipated transportation impacts of the proposed development. This summary shall include a general description of the impact of the entire development on the local street and road network, and shall specify the maximum projected average daily trips, projected AM and PM peak hour traffic and the maximum parking demand associated with build-out each phase of the master plan or planned unit development.

h. In addition to the summary statement of anticipated transportation impacts, an applicant shall provide a traffic impact study as specified by City requirements. The transportation impact study shall either:

i. Address the impacts of the development of the site consistent with all phases of the general development plan; or

ii. Address the impacts of specific phases if the City engineer determines that the traffic impacts of the full development can be adequately evaluated without specifically addressing subsequent phases.

i. If an applicant chooses to pursue option h.1., the applicant may choose among three options for implementing required transportation capacity and safety improvements:

i. The general development plan may include a phasing plan for the proposed interior circulation system and for all on-site and off-site transportation capacity and safety improvements required on the existing street system as a result of fully implementing the plan. If this option is selected, the transportation phasing plan shall be binding on the applicant.

ii. The applicant may choose to immediately implement all required transportation safety and capacity improvements associated with the fully executed general development plan. If this option is selected, no further transportation improvements will be required from the applicant. However, if a general development plan is later amended in a manner so as to cause the projected average daily trips, the projected a.m. or p.m.

peak hour trips, or the peak parking demand of the development to increase over original projections, an additional transportation impact report shall be required to be submitted during the detailed development plan review process for all future phases of the development project and additional improvements may be required.
iii. The applicant may defer implementation of any and all capacity and safety improvements required for any phase until that phase of the development reaches the detailed development plan stage. If this option is selected, the applicant shall submit a table linking required transportation improvements to vehicle trip thresholds for each development phase.

j. For residential and mixed-use projects:
i. Proposed minimum lot area, width, frontage and yard requirements.
ii. Proposed project density in number of units per acre.
iii. Proposed residential types and number of each.

Applicant's Response:
Please see the narrative included with this application which addresses the above narrative requirements. The narrative includes references to various reports and project plan sheets.

2. Maps and Diagrams. The applicant shall submit, in the form of scaled maps or diagrams, as appropriate, the following information:

a. A preliminary site circulation plan showing the approximate location of proposed vehicular, bicycle, and pedestrian access points and circulation patterns, parking and loading areas or, in the alternative, proposed criteria for the location of such facilities to be determined during detailed development plan review.
b. The approximate location of all proposed streets, alleys, other public ways, sidewalks, bicycle and pedestrian access ways and other bicycle and pedestrian ways, transit streets and facilities, neighborhood activity centers and easements on and within two hundred fifty feet of the site. The map shall identify existing subdivisions and development and un-subdivided or unpartitioned land ownerships adjacent to the proposed development site and show how existing streets, alleys, sidewalks, bike routes, pedestrian/bicycle access ways and utilities within two hundred fifty feet may be extended to and/or through the proposed development.
c. The approximate location of all public facilities to serve the proposed development, including water, sanitary sewer, stormwater management facilities.
d. The approximate location, footprint and building square footage of buildings within of each phase of proposed development, and/or proposed lot patterns for each phase of future development.
e. The approximate locations of proposed parks, playgrounds or other outdoor play areas; outdoor common areas and usable open spaces; and natural, historic and cultural resource areas or features proposed for preservation. This information shall include identification of areas proposed to be dedicated or otherwise preserved for public use and those open areas to be maintained and controlled by the owners of the property and their successors in interest for private use.

Applicant's Response:
Please see the proposed General Development Plan maps accompanying this application.

C. Approval Criteria for a General Development Plan. The Planning Commission may approve an application for general development plan only upon finding that the following approval criteria are met.

1. The proposed General Development Plan is consistent with the purposes of OCMC 17.65.

Applicant's Response:
The proposed General Development Plan identifies the proposed uses and street patterns of the subject property which has been vacant for nearly twenty-five years. The proposed development will include mixed uses comprised of multi-family residential, retail, and restaurant uses with various adjustments requested born out of the site's geometry and need for a public roadway through the site. The proposed masterplan will be developed in phases, with Phase 1 being the public street and utility improvements together with rough grading of the site. Parcels A, B, and D include retail, multi-family residential, and restaurant uses and will be constructed based on market demand following their individual Detailed Development Plan approval processes. Construction of the individual parcel uses may be concurrent with each other or may be separate. The master plan process is useful for implementing such a development plan by promoting efficiency in the overall development process and infrastructure needed to support the entire development.

2. Development shall demonstrate compliance with OCMC 12.04 16.12, 17.62, if applicable, and 16.08, if applicable.

Applicant's Response:
Compliance with OCMC 12.04, 16.12, 17.62, and 16.08 is demonstrated in our Masterplan Detailed Development Plan code responses. Please see our accompanying DDP application/code responses.

3. Public services for transportation, water supply, police, fire, sanitary waste disposal, storm-water disposal, and any other needed public services and facilities including schools and parks for proposed residential uses, are capable of serving the proposed development, or will be made capable by the time each phase of the development is completed.

Applicant's Response:
The proposed masterplan development will construct the necessary public roadway and utility improvements associated with the proposed development plan, including roadway and bike facilities, pedestrian improvements, traffic signal improvements, storm sewer, sanitary sewer, water, and dry utilities. When Parcel B submits its Detailed Development Plan, residential open space will be further described.

4. The proposed General Development Plan protects any inventoried Goal 5 natural, historic or cultural resources within the proposed development boundary consistent with the provisions of applicable overlay districts.

Applicant's Response:
The proposed development is adjacent to and overlooks the Newel Creek Canyon, an inventoried Goal 5 natural resource within the city of Oregon City. The property's eastern edge is included in a geologic hazard overlay and a geotechnical report addressing development, including slope stability, is included with this application. The geotechnical analysis recommends a 35-ft setback from the top of

bank overlooking Newell Creek Canyon, as well as specific retaining wall recommendations which mitigate the geologic hazard. Additionally, the project's overall stormwater discharge location lies within a Natural Resource Overlay District (NROD) which also drains through the Newell Creek Canyon. The project minimizes impacts to the NROD buffer due to the required public street connection to Beavercreek Rd and mitigates the impact that it does have. The project's stormwater facilities provide both water quality and detention treatment to reduce impacts to the downstream drainage through Newell Creek Canyon. Please see our specific code responses to the Geologic Hazard and NROD code sections included with this application.

5. The proposed General Development Plan, including development standards and impact mitigation thresholds and improvements, adequately mitigates identified impacts from each phase of development. For needed housing, as defined in ORS 197.303(1), the development standards and mitigation thresholds shall contain clear and objective standards.

Applicant's Response:
Oregon City's 2021 Housing Needs Analysis identified the need for 7,435 new dwelling units over the next 20 years. The proposed multi-family residential component of the General Development Plan helps the city achieve their goal of providing more housing. The proposed roadway and signal improvements, together with cost participation in the city's planned Beavercreek Road/Hwy 213 improvements, will mitigate the project's development impact. The roadway and utility improvements are proposed to be constructed with the initial phase of development, with the uses generating the actual impact to follow, thereby providing impact mitigation before the proposed demand.

6. The proposed general development plan is consistent with the Oregon City Comprehensive Plan.

Applicant's Response:
As described in our response to OCMC 17.56.010.A.5, the proposed General Development Plan is consistent with the Oregon City Comprehensive Plan. Please see our response to OCMC 17.56.010.A.5 for the Parcel D drive-through conditional use. The overall General Development Plan provides similar compliance with our responses to OCMC 17.56.010.A.5.

7. The proposed general development plan is consistent with the underlying zoning district(s) and any applicable overlay zone or concept plans.

Applicant's Response:
The proposed General Development Plan is consistent with the underlying MUC-2 zone, Geologic Hazard Overlay, and Natural Resource Overlay District as identified and described in this application and associated code responses and supporting documents.

8. For projects with a residential use component, the proposed general development plan includes common open space for the recreational needs of the development's residents.
a. Required open space shall be located either on-site or off-site within one-quarter mile of the development.

Applicant's Response:
Required open space for the Parcel B multi-family component of the General Development Plan is proposed to be located on-site. While Parcel B's Detailed Development Plan will provide detail on the proposed open space, the proposed open space area is shown on the General Development Plan Sht GDP-C1.0.

b. Minimum required open space shall be 100 square feet per residential unit in the development.

Applicant's Response:
The proposed Parcel B multi-family component of the General Development Plan includes 208 units, resulting in a required open space of 20,800 sf at 100 sf per unit. As shown on General Development Plan Sht GDP-C1.0, Parcel B includes over 12,000 sf of open space between the two northerly buildings (subject to Parcel B Detailed Development Plan submittal/approval) and over 20,000 sf of open space between the top of the slope and the geologic hazard setback line. A pedestrian pathway is proposed within this geologic hazard setback. Additionally, over 42,000 sf of forested open space lies on the east edge of Parcel B between the property boundary and the top of slope. Parcel B provides open space far in excess of the minimum required open space.

Note – OCMC 17.62.057.B.2 identifies a smaller open space requirement for mixed-use zones of 50 square feet per residential unit. This results in an open space requirement of 10,400 square feet. The proposed open space will exceed the criteria identified in both 17.65.050.C.8.b and 17.62.057.B.2.

c. The open space area may be in private ownership or proposed for public dedication, at the City's discretion whether to accept.

Applicant's Response:
The Parcel B open space is currently planned for private ownership.

d. The open space shall be developed with a unified design to provide for a mix of passive and active uses. Passive uses include, but are not limited to sitting benches, picnicking, reading, bird watching and natural areas. Active uses include, but are not limited to playgrounds, sports fields and courts, running and walking areas.

Applicant's Response:
General Development Plan Sht GDP-C1.0 identifies active open space between the two northerly buildings, and the Geologic Hazard setback area contains a pedestrian pathway. Portions of the Geologic Hazard setback area will be planted with NROD mitigation plantings. The steep slope open space area on the east edge of Parcel B is intended to remain in its natural state.

e. Land area to be used for the open space area that is required in this section shall not include required setback areas, required landscaping, streets, rights-of-way, driveways, or parking spaces.

Applicant's Response:
The Geologic Hazard setback area is not a setback required by the city. Instead, it is a setback recommended by the geotechnical engineer to protect against long-term slope stability concerns. Accordingly, it is not considered a building setback for the purpose of this section. However, even if the Geologic Hazard setback area is excluded from open space consideration (not likely, since the project is required to provide a pedestrian pathway), the steep slope area east of the top of slope is more than adequate to satisfy the open space requirements.

f. Unless dedicated to the public, the applicant shall also provide an irrevocable legal mechanism for the maintenance of the open space and any related landscaping and facilities. The applicant shall submit, for City review and approval, all proposed deed restrictions or other legal instruments used to reserve open space and maintenance of open space and any related landscaping and facilities.

Applicant's Response:
Development of Parcel B will be described in more detail with a separate Detailed Development Plan application. Maintenance of the required open space will be addressed with Parcel B's Detailed Development Plan.

9. For projects with a residential use component, the proposed general development plan includes a mix of residential uses such that no single residential use exceeds seventy-five percent of the total proposed units. The mix of residential uses shall provide variety of dwelling types and sizes that are integrated throughout the site, rather than isolated from one another, with smooth transitions between residential types including appropriate setbacks, landscaping or screening as necessary, while maintaining street and pedestrian connectivity between all residential uses. Tenancy (i.e. ownership versus rental) shall not be a consideration in determination of the mix of residential use. For the purposes of this section, residential uses include single-family detached, duplex, triplex, quadplex, townhouse, cottage cluster, and multi-family.

Applicant's Response:
Development of Parcel B will be described in more detail with a separate Detailed Development Plan application. The multi-family units for Parcel B will include a mixture of unit sizes/configurations consistent with this code section.

<u>17.65.060 - Detailed development plan.</u>

A. Submittal Requirements.

1. A transportation impact study documenting the on- and off-site transportation impacts, as specified in OCMC 17.65.050.B.1.h.i. If such an analysis was submitted as part of the general development plan process, the scope of the report may be limited to any changes which have occurred during the interim and any information listed below which was not a part of the initial study.

The on-site portion of the analysis shall include the location, dimensions and names of all proposed streets, alleys, other public ways, sidewalks, bike routes and bikeways, pedestrian/bicycle access ways and other pedestrian and bicycle ways, transit streets and facilities, neighborhood activity centers, and easements on and within two hundred fifty feet of the boundaries of the site. The map

shall identify existing subdivisions and development and un-subdivided or unpartitioned land ownerships adjacent to the proposed development site and show how existing streets, alleys, sidewalks, bike routes, pedestrian/bicycle access ways and utilities within two hundred fifty feet may be extended to and/or through the proposed development.

2. The location within the development and in the adjoining streets of existing and proposed sewers, water mains, culverts, drain pipes, underground electric, cable television and telephone distribution lines, gas lines, and the location of existing aerial electric, telephone and television cable lines, if any, to be relocated within the development.

3. For portions of the project that would otherwise be subject to site plan and design review, a site plan or plans, to scale, containing the required information identified in OCMC 17.62.040.

4. For residential portions of the project not otherwise subject to site plan and design review, a site plan or plans, to scale, showing the proposed land uses and densities, building locations, lot patterns, circulation patterns, and open space locations and uses.

5. Any other information the Community Development Director deems necessary to show that the proposed development will comply with all of the applicable Chapter 17 requirements.

B. Approval Criteria. The Community Development Director shall approve an application for detailed development plan approval only upon findings that:

1. All development standards and impact mitigation meet the requirements of the approved general development plan, including conditions of approval.
2. Any other applicable zoning regulations that are not addressed in the general development plan are met, unless an adjustment to those regulations has been applied for and is approved. The approval standards applicable to adjustments required as part of a master plan or planned unit development are contained in OCMC 17.65.070.
3. The detailed development plan conforms with the base zone standards, applicable residential design standards, and applicable standards contained in Chapters 17.62, 17.52, 16.12, and 16.08 unless adjusted as provided in OCMC 17.65.070

Applicant's Response:
Please see our separate response to the Detailed Development Plan submittal for the proposed street and utility improvements and site rough grading.

17.65.070 - Adjustments to development standards.
A. Purpose. In order to implement the purpose of the City's master plan or planned unit development process, which is to foster the growth of major institutions, major residential, commercial or mixed-use development, and other large-scale development, while identifying and mitigating their impacts on surrounding properties and public infrastructure, an applicant may request one or more adjustments to the applicable development regulations as part of the master planning or planned unit development process, and are not required to go through the variance process pursuant to OCMC Chapter 17.60.

B. Procedure. Requests for adjustments shall be processed concurrently with a general development plan. An adjustment request at the detailed development plan review shall cause the detailed development plan to be reviewed as a Type III application.

Applicant's Response:
The applicant acknowledges the adjustment standards of this section.

C. Regulations That May be Adjusted. Adjustments may be allowed for the following items:

1. Dimensional standards of the underlying zone of up to twenty percent, except the perimeter of the development shall meet the underlying zone's setbacks when adjacent to residentially zoned property.
2. Site plan and design standards.
3. Residential design standards.
4. Increase in allowed maximum residential density of up to ten percent.
5. Standards for land division approval.
6. Additional uses allowed with residential projects, or residential component of projects:
a. Notwithstanding the use provisions of the underlying zones, neighborhood commercial uses as defined in Chapter 17.24.020, including restaurants and eating and drinking establishments without a drive-through, retail trade, and services, are permitted on up to ten percent of the net developable area. The neighborhood commercial uses shall be planned and constructed so as to support and be compatible with the entire development and shall not alter the character of the surrounding area so as to substantially preclude, impair or limit the use of surrounding properties for the primary uses listed in the underlying district.
b. Public or private parks and playgrounds, community buildings and/or outdoor recreational facilities, such as swimming pools and tennis courts.
c. Indoor recreational facilities, such as racquetball or tennis courts, fitness centers or swimming pools.
d. Common public and private open space including trails.
e. Primary or accessory uses that are not identified as a permitted or conditional use in the underlying zone but which are defined in the code.

Applicant's Response:
The applicant acknowledges the above regulations that may be adjusted via the masterplan process. The General Development Plan application seeks adjustment to the maximum parking standards as described in our responses to OCMC 17.52.015.

D. Regulations That May Not be Adjusted. Adjustments are prohibited for the following items:

1. To allow a primary or accessory use that is not identified as a permitted, or conditional use in the underlying zone, with the exception of the additional uses permitted under OCMC 17.65.070.C.6 above;
2. To any regulation that contains the word "prohibited";
3. As an exception to a threshold review, such as a Type III review process; and
4. Minimum density for residential sites may not be reduced.

Applicant's Response:
The proposed masterplan General development Plan and Detailed Development Plan submittals do not seek any of the above prohibited adjustments.

E. Approval Criteria. A request for an adjustment to one or more applicable development regulations under this section shall be approved if the review body finds that the applicant has shown the following criteria to be met.

1. Granting the adjustment will equally or better meet the purpose of the regulation to be modified;

Applicant's Response:
Please see our responses to maximum parking adjustment for Parcels A and D in OCMC 17.52.015

2. If more than one adjustment is being requested, the cumulative effect of the adjustments results in a project that is still consistent with the overall purpose of the zone;

Applicant's Response:
Please see our responses to maximum parking adjustment for Parcels A and D in OCMC 17.52.015

3. City-designated Goal 5 resources are protected to the extent otherwise required by Title 17;

Applicant's Response:
Please see our responses to maximum parking adjustment for Parcels A and D in OCMC 17.52.015

4. Any impacts resulting from the adjustment are mitigated such that the development does not create significant adverse impacts on adjacent properties;

Applicant's Response:
Please see our responses to maximum parking adjustment for Parcels A and D in OCMC 17.52.015. Denying the adjustment for maximum parking on Parcels A and D could result in customers from those uses taking up parking spaces from the adjacent Parcel D multi-family development or from existing commercial and residential uses north of the site. Approval of the maximum parking adjustment request is not expected to have adverse impacts on adjacent properties.

5. If an environmental zone, the proposal has as few significant detrimental environmental impacts on the resource and resource values as is practicable; and

Applicant's Response:
Please see our responses to maximum parking adjustment for Parcels A and D in OCMC 17.52.015. the uses subject to the maximum parking adjustment are not located in an environmental zone.

6. The proposed adjustment is consistent with the Oregon City Comprehensive Plan and a concept plan if applicable.

Applicant's Response:
Please see our responses to maximum parking adjustment for Parcels A and D in OCMC 17.52.015. The requested maximum parking adjustment is consistent with the Comprehensive Plan. The Comprehensive Plan Goals were discussed in our response to OCMC 17.56.010.A.5 (our Conditional Use Approval request). The maximum parking request has similar responses to Comprehensive Plan goals as does the Conditional Use response.

17.65.80 - Amendments to approved plans.

A. When Required. An amendment to an approved general development plan or detailed development plan is required for any use or development that is not in conformance with the applicable plan, as provided below. The approval criteria contained in OCMC 17.65.050 will apply to general development plan amendments, the approval criteria contained in OCMC 17.65.060 will apply to detailed development plan amendments. The thresholds and procedures for amendments are stated below.

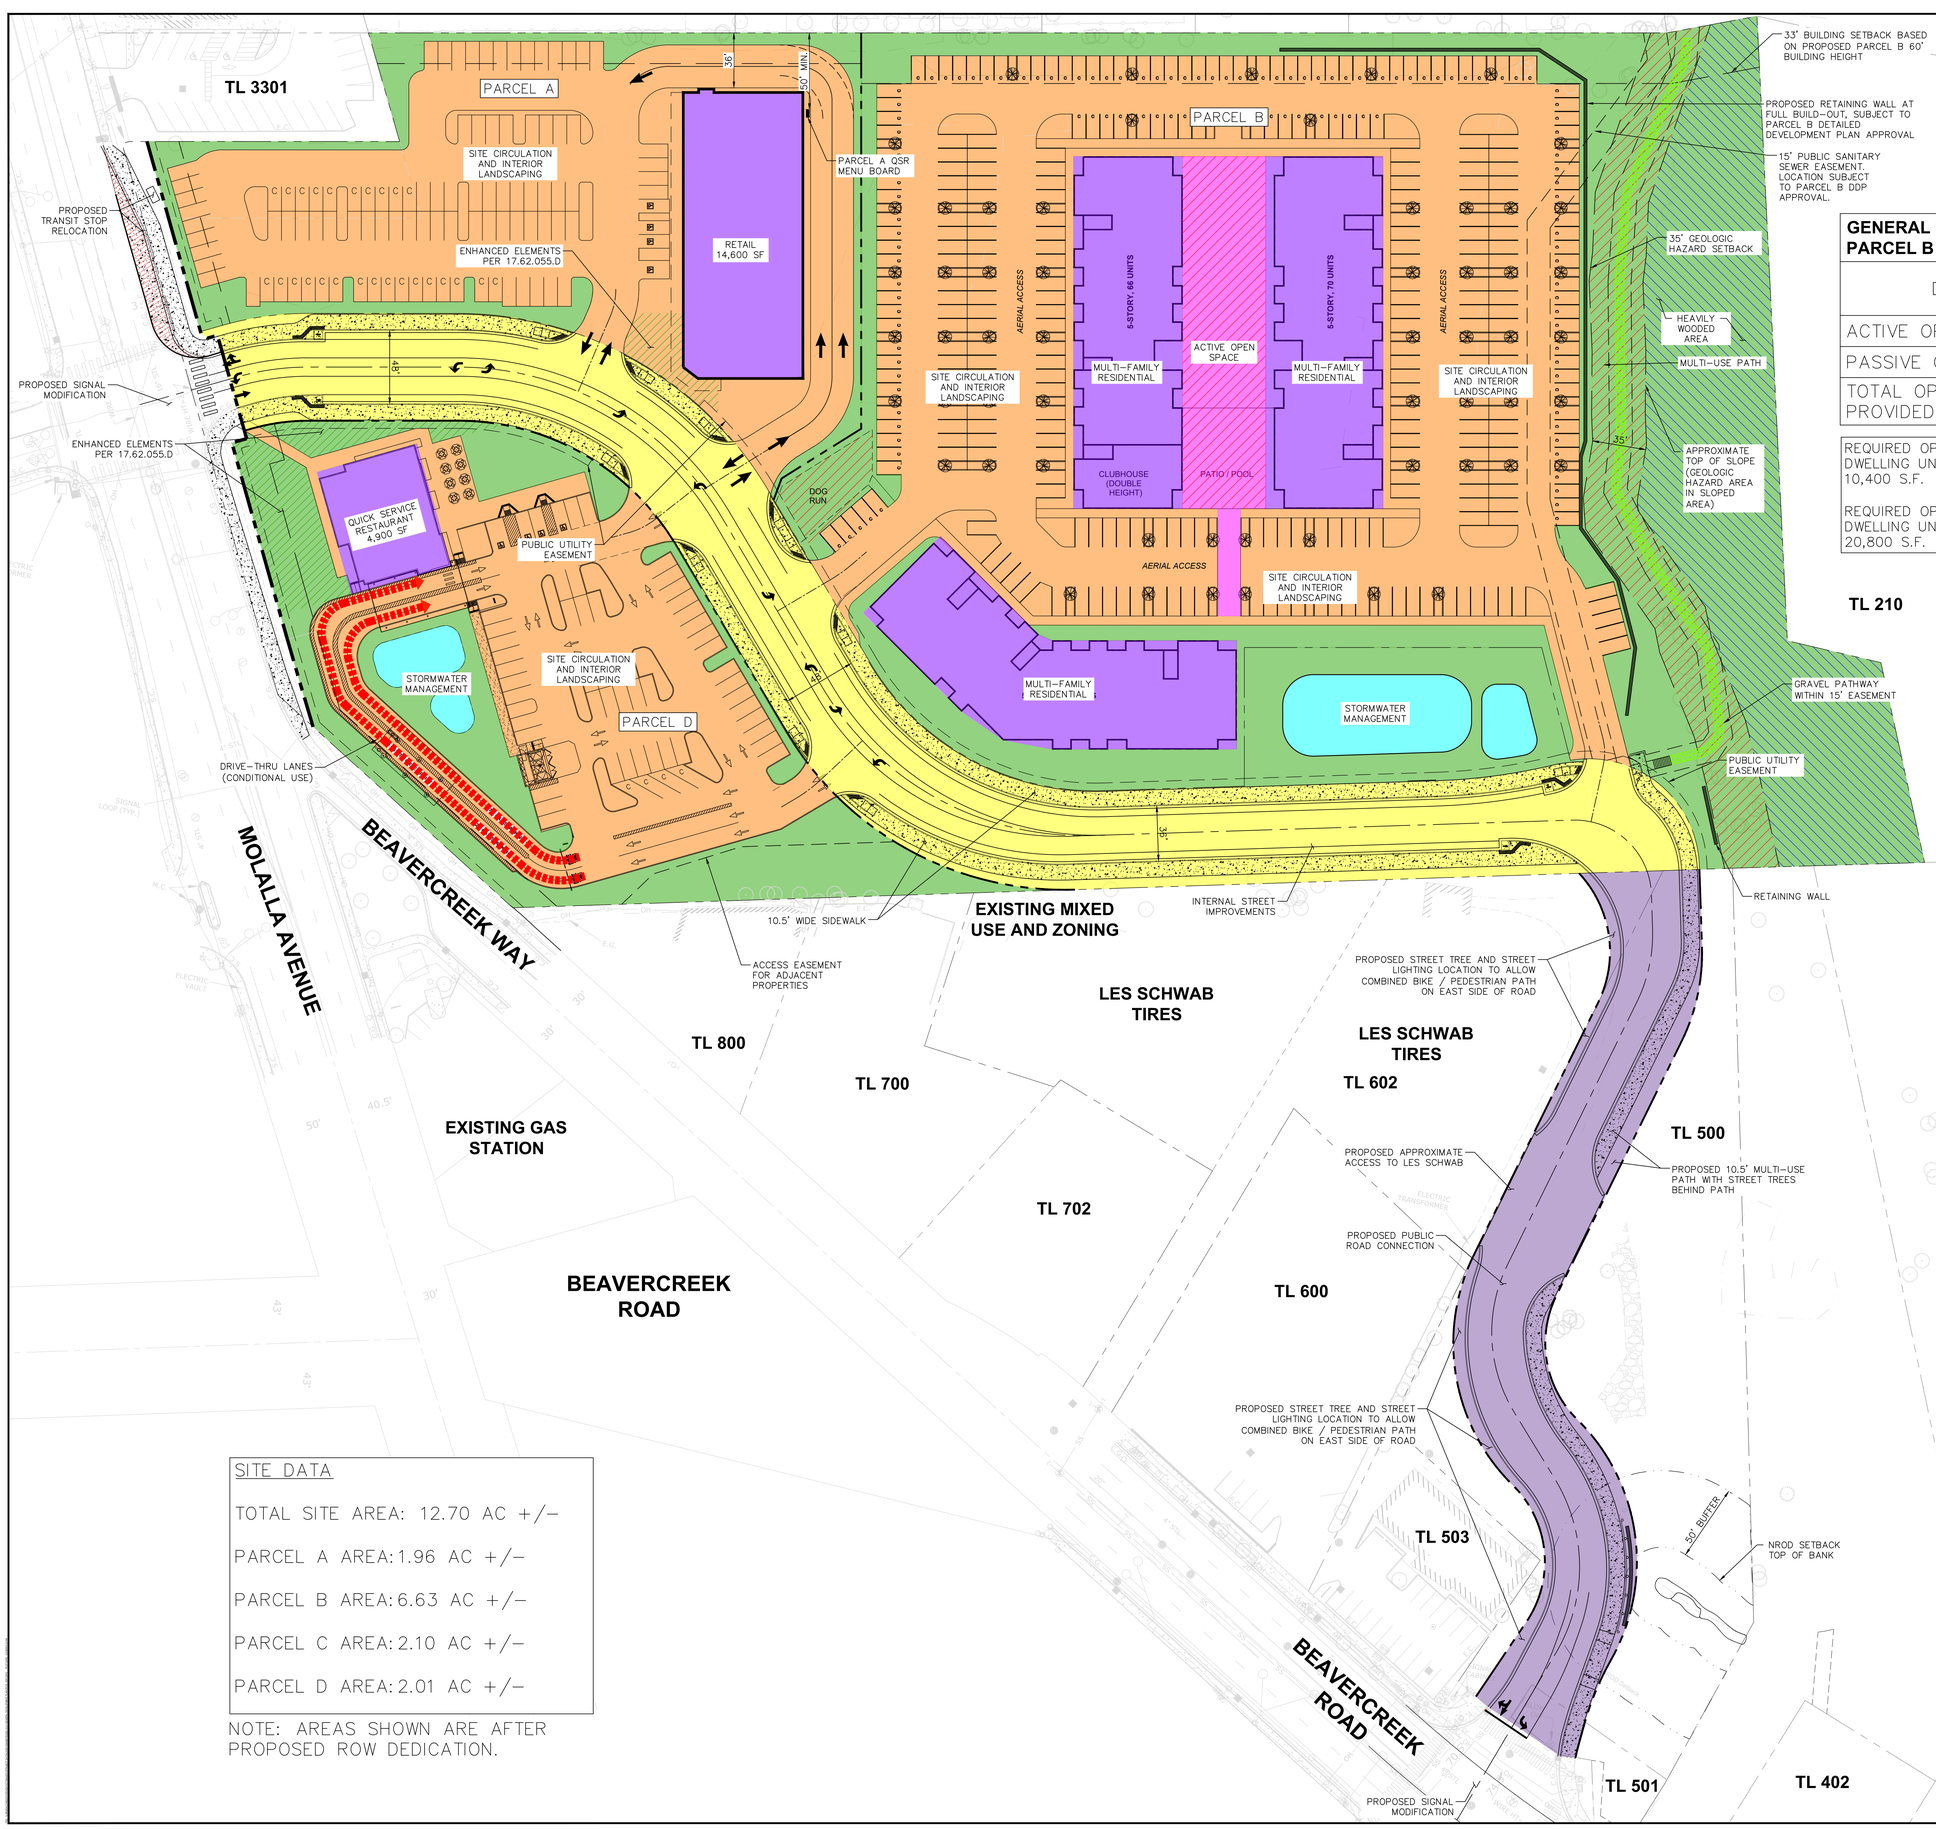
Applicant's Response:
The applicant acknowledges the amendment procedures identified in the section.

B. Type III Procedure. Unless the approved general development plan or detailed development plan specifically provides differently, amendments to either plan that require a Type III procedure are:

1. A proposed expansion of the approved boundary;
2. A proposed reduction in the approved boundary that affects a condition of approval, or takes the site out of conformance, or further out of conformance, with a development standard;
3. Proposals that increase the amount, frequency, or scale of a use over ten percent of what was approved (examples include the number of students, patients or members; the number of helicopter flights; the number or size of special events; transportation impacts);
4. New uses not covered in the plan that will increase vehicle trips to the site greater than ten percent of the original amount approved;
5. Increases or decreases in overall floor area of development on the site or number of residential units of over ten percent;
6. A increase/decrease greater than ten percent in the amount of approved or required parking; and
7. Proposed uses or development which were reviewed, but were denied because they were found not to be in conformance with an approved plan.

Applicant's Response:
The applicant acknowledges the amendment procedures identified in the section.

C. Type II Procedure. Unless an approved plan specifically provides otherwise, amendments to a general development plan or detailed development plan not specifically stated in subsection B or D are processed through a Type II procedure.
D. Type I Procedure. Unless an approved plan specifically provides otherwise, the following amendments to a general development plan or detailed development plan shall be processed through a Type I procedure:



1. Accessory uses and structures that meet applicable development regulations;

2. Reconfiguration of approved parking or landscape designs that do not alter the points of ingress or egress, and do not change the number of parking spaces required, so long as the reconfiguration meets applicable development regulations; and
3. Structures for approved uses that do not exceed one thousand five hundred square feet in size and that meet applicable development regulations

Applicant's Response:
The applicant acknowledges the amendment procedures identified in the section.

17.65.090 - Regulations that apply.
An applicant is entitled to rely on land use regulations in effect on the date its general development plan application was initially submitted, pursuant to ORS 227.178(3), as that statute may be amended from time to time. After a general development plan is approved, and so long as that general development plan is in effect, an applicant is entitled to rely on the land use regulations in effect on the date its general development plan application was initially submitted, as provided above, when seeking approval of detailed development plans that implement an approved general development plan. At its option, an applicant may request that a detailed development plan be subject to the land use regulations in effect on the date its detailed development plan is initially submitted.

Applicant's Response:
Application for masterplan approval was made June 27, 2025, and notice of incomplete application was provided July 24, 2025. The applicant intends to resubmit the application materials addressing those items in the incomplete letter within the statutory 180-days to remain vested under the rules in place when the initial application was submitted.

GENERAL DEVELOPMENT PLAN OPEN SPACE - PARCEL B

DESCRIPTION	AREA (SF)	HATCH
ACTIVE OPEN SPACE	35,036	
PASSIVE OPEN SPACE	42,572	
TOTAL OPEN SPACE PROVIDED	77,608	

REQUIRED OPEN SPACE PER 17.62.057.B.2 = 50 S.F. / DWELLING UNIT. AT 208 UNITS, REQUIRED OPEN SPACE IS 10,400 S.F.

REQUIRED OPEN SPACE PER 17.65.050.C.8.b = 100 S.F. / DWELLING UNIT. AT 208 UNITS, REQUIRED OPEN SPACE IS 20,800 S.F.

PHASING

PHASE 1 – MOLALLA AVENUE IMPROVEMENTS, PROPOSED PUBLIC ROAD (AND ASSOCIATED UTILITIES AND EXTENDING TO BEAVERCREEK ROAD), OVERALL SITE ROUGH GRADING, AND PROPOSED STORMWATER MANAGEMENT FACILITY. PHASE 1 DETAILED DEVELOPMENT PLAN IS SUBMITTED CONCURRENTLY WITH THIS GENERAL DEVELOPMENT PLAN.

PHASE 2 – PARCEL D SITE AND UTILITY IMPROVEMENTS, INCLUDING THE PARCEL D STORMWATER MANAGEMENT FACILITY.

PHASE 3 – PARCEL B SITE AND UTILITY IMPROVEMENTS, INCLUDING EXTENSION OF SANITARY SEWER TO NORTHEAST CORNER OF SITE.

PHASE 4 – PARCEL A SITE AND UTILITY IMPROVEMENTS.

PHASES 2–4 ARE MARKET DRIVEN AND CAN BE CONSTRUCTED CONCURRENTLY OR SEPARATELY WITH OTHER PHASES.

PARCELS A, B, AND D LAYOUTS ARE SHOWN SCHEMATICALLY. PARCELS A, B, AND D WILL EACH SUBMIT THEIR OWN DETAILED DEVELOPMENT PLAN FOLLOWING GENERAL DEVELOPMENT PLAN APPROVAL.

GENERAL DEVELOPMENT PLAN DECISIONS:

1. OVERALL GENERAL DEVELOPMENT PLAN APPROVAL
2. CONDITIONAL USE APPROVAL FOR DRIVE-THROUGH FACILITIES ON BOTH PARCELS A AND D
3. MAXIMUM PARKING ADJUSTMENT

SITE DATA

TOTAL SITE AREA: 12.70 AC +/-

PARCEL A AREA: 1.96 AC +/-

PARCEL B AREA: 6.63 AC +/-

PARCEL C AREA: 2.10 AC +/-

PARCEL D AREA: 2.01 AC +/-

NOTE: AREAS SHOWN ARE AFTER PROPOSED ROW DEDICATION.

PROPERTY DESCRIPTION

LOCATED IN THE S.E. 1/4 & S.W. 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, W.M. CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON

VERTICAL BENCHMARK

VERTICAL DATUM IS BASED ON THE CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE ROAD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. GPS STA. LIBRARY 1990".
ELEVATION = 452.739'.

SURVEY MONUMENT PROTECTION

EXISTING SURVEY MONUMENT ARE TO BE PROTECTED DURING CONSTRUCTION OR REPLACED IN ACCORDANCE WITH OREGON REVISED STATUTES 209.140 – 209.155.

GENERAL NOTES

1. ALL WORK AND MATERIALS SHALL COMPLY WITH ALL OREGON CITY REGULATIONS AND CODES AND O.S.H.A. STANDARDS, INCLUDING BUT NOT LIMITED TO THE CURRENT OREGON CITY ROAD DESIGN AND CONSTRUCTION STANDARDS, CLEAN WATER SERVICES DESIGN AND CONSTRUCTION STANDARDS, THE OREGON TRANSPORTATION COMMISSION STANDARDS FOR ACCESSIBLE PARKING DATED AUGUST 2018, AND THE APWA STANDARDS WHICH ARE HEREBY REFERENCED AS PART OF THESE PLANS.

2. THE DESIGN SHOWN IS BASED UPON THE ENGINEER'S UNDERSTANDING OF THE EXISTING CONDITIONS. THE PLAN DOES NOT REPRESENT A DETAILED FIELD SURVEY. THE EXISTING CONDITIONS SHOWN ON THIS PLAN SHEET ARE BASED UPON THE ALTA SURVEY PREPARED BY CES | NW, DATED JULY 9, 2012. THE CONTRACTOR IS RESPONSIBLE FOR VERIFYING FIELD CONDITIONS PRIOR TO BIDDING THE PROPOSED SITEWORK IMPROVEMENTS. IF CONFLICTS ARE DISCOVERED, THE CONTRACTOR SHALL NOTIFY THE OWNER/DEVELOPER PRIOR TO INSTALLATION OF ANY PORTION OF THE SITEWORK WHICH WOULD BE AFFECTED. IF CONTRACTOR DOES NOT ACCEPT EXISTING SURVEY, INCLUDING TOPOGRAPHY AS SHOWN ON THE PLANS, WITHOUT EXCEPTION, HE SHALL HAVE MADE, AT HIS OWN EXPENSE, A TOPOGRAPHIC SURVEY BY A REGISTERED LAND SURVEYOR AND SUBMIT IT TO THE OWNER FOR REVIEW.

3. CAUTION – NOTICE TO CONTRACTOR
THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR ELEVATION OF EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITIES, AND WHERE POSSIBLE, MEASUREMENTS TAKEN IN THE FIELD. THE INFORMATION IS NOT TO BE RELIED ON AS BEING EXACT OR COMPLETE. THE CONTRACTOR MUST CALL THE APPROPRIATE UTILITY COMPANY AT LEAST 48 HOURS BEFORE ANY EXCAVATION TO REQUEST EXACT FIELD LOCATION OF UTILITIES. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO RELOCATE ALL EXISTING UTILITIES WHICH CONFLICT WITH THE PROPOSED IMPROVEMENTS SHOWN ON THE PLANS.

4. IN THE EVENT OF CONFLICTS BETWEEN THE VARIOUS PROVISIONS OF THIS PLAN SET, THE MORE STRINGENT PROVISION APPLY.

5. ATTENTION: OREGON LAW REQUIRES YOU TO FOLLOW RULES ADOPTED BY THE OREGON UTILITY NOTIFICATION CENTER. THOSE RULES ARE SET FORTH IN OAR 952-001-0001 (ADOPTION OF MODEL RULES) THROUGH 952-001-0100 (RECORD KEEPING REQUIREMENTS). YOU MAY OBTAIN COPIES OF THE RULES BY CALLING THE CENTER.
NOTES: THE TELEPHONE NUMBER FOR THE OREGON UTILITY NOTIFICATION CENTER IS (503) 232-1987.

6. A ROAD CLOSURE WILL NO BE PERMITTED WITHOUT A SEPARATE ROAD CLOSURE PERMIT THROUGH WASHINGTON COUNTY TRAFFIC ENGINEERING.

7. THE CONTRACTOR, AT THE TIME OF MEETING WITH COUNTY INSPECTION STAFF FOR A PRE-CONSTRUCTION MEETING, SHALL PROVIDE THEIR WORK TRAFFIC CONTROL PLAN.

8. ACCOMMODATE ALL ROAD USERS AT ALL TIMES INCLUDING MOTORISTS, BICYCLISTS, PEDESTRIANS, AND THOSE WITH DISABILITIES OR IMPAIRMENTS. INSTALL AND MAINTAIN ADDITIONAL TEMPORARY SIGNING AND TRAFFIC CONTROL DEVICES FOR THE CONTROL OF NON-MOTORIZED VEHICLES AND PEDESTRIANS WHERE A REASONABLE VOLUME OF THESE USERS ARE EXPECTED AND WHERE WORK IS EXPECTED TO LAST LONGER THAN ONE HOUR. MAINTAIN SAFE ACCESSIBILITY OR PROVIDE SUITABLE ALTERNATE ROUTES IN, THROUGH, OR AROUND WORK AREAS.

9. ESTABLISH AND MAINTAIN WORK ZONE TRAFFIC CONTROL IN COMPLIANCE WITH THE OREGON TEMPORARY TRAFFIC CONTROL HANDBOOK FOR OPERATIONS OF THREE DAYS OR LESS (DECEMBER 2011) ANY TIME VEHICLE OR PEDESTRIAN TRAFFIC IS INFLUENCED BY THE WORK. FOR WORK REQUIRING DEVICES IN PLACE LONGER THAN THREE (3) DAYS, A SITE SPECIFIC TRAFFIC CONTROL PLAN BASED ON THE PRINCIPLES IN PART 6 OF THE MUTCD, THE OREGON SUPPLEMENT AND ODOT'S 2015 STANDARD DRAWINGS TM800 –TM871, IS REQUIRED. ALL TRAFFIC CONTROL DEVICES SHALL MEET OR EXCEED THE NCHRP 350 REQUIREMENTS FOR CRASHWORTHINESS. COMPLETED SIGNAL SHUT DOWN REQUESTS MUST BE RECEIVED BY THE COUNTY A MINIMUM OF 3 WORKING DAYS PRIOR TO ANY PROPOSED SIGNAL SHUT DOWN.

GENERAL DEVELOPMENT PLAN OPEN SPACE - PARCEL B

DESCRIPTION	AREA (SF)	HATCH
ACTIVE OPEN SPACE	35,036	
PASSIVE OPEN SPACE	42,572	
TOTAL OPEN SPACE PROVIDED	77,608	

REQUIRED OPEN SPACE PER 17.62.057.B.2 = 50 S.F. / DWELLING UNIT. AT 208 UNITS, REQUIRED OPEN SPACE IS 10,400 S.F.

REQUIRED OPEN SPACE PER 17.65.050.C.8.b = 100 S.F. / DWELLING UNIT. AT 208 UNITS, REQUIRED OPEN SPACE IS 20,800 S.F.

PHASING

PHASE 1 – MOLALLA AVENUE IMPROVEMENTS, PROPOSED PUBLIC ROAD (AND ASSOCIATED UTILITIES AND EXTENDING TO BEAVERCREEK ROAD), OVERALL SITE ROUGH GRADING, AND PROPOSED STORMWATER MANAGEMENT FACILITY. PHASE 1 DETAILED DEVELOPMENT PLAN IS SUBMITTED CONCURRENTLY WITH THIS GENERAL DEVELOPMENT PLAN.

PHASE 2 – PARCEL D SITE AND UTILITY IMPROVEMENTS, INCLUDING THE PARCEL D STORMWATER MANAGEMENT FACILITY.

PHASE 3 – PARCEL B SITE AND UTILITY IMPROVEMENTS, INCLUDING EXTENSION OF SANITARY SEWER TO NORTHEAST CORNER OF SITE.

PHASE 4 – PARCEL A SITE AND UTILITY IMPROVEMENTS.

PHASES 2–4 ARE MARKET DRIVEN AND CAN BE CONSTRUCTED CONCURRENTLY OR SEPARATELY WITH OTHER PHASES.

PARCELS A, B, AND D LAYOUTS ARE SHOWN SCHEMATICALLY. PARCELS A, B, AND D WILL EACH SUBMIT THEIR OWN DETAILED DEVELOPMENT PLAN FOLLOWING GENERAL DEVELOPMENT PLAN APPROVAL.

GENERAL DEVELOPMENT PLAN DECISIONS:

1. OVERALL GENERAL DEVELOPMENT PLAN APPROVAL
2. CONDITIONAL USE APPROVAL FOR DRIVE-THROUGH FACILITIES ON BOTH PARCELS A AND D
3. MAXIMUM PARKING ADJUSTMENT

SITE DATA

TOTAL SITE AREA: 12.70 AC +/-

PARCEL A AREA: 1.96 AC +/-

PARCEL B AREA: 6.63 AC +/-

PARCEL C AREA: 2.10 AC +/-

PARCEL D AREA: 2.01 AC +/-

NOTE: AREAS SHOWN ARE AFTER PROPOSED ROW DEDICATION.

ALTA/ACSM SURVEY

LOCATED IN THE S.E. 1/4 & S.W. 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, W.M. CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON
REFERENCE: STEWART TITLE PRELIMINARY TITLE REPORT SUPPLEMENTAL NO. 1
ORDER NO. 1016646 DATED APRIL 27, 2012

CERTIFICATION FOR SURVEY

1. THE SURVEY WAS MADE ON THE GROUND DURING APRIL AND MAY OF 2012, AND CORRECTLY SHOWS THE AREA OF THE SUBJECT PROPERTY, THE LOCATION AND TYPE OF ALL BUILDINGS, STRUCTURES AND OTHER IMPROVEMENTS SITUATED ON THE SUBJECT PROPERTY.

2. EXCEPT AS SHOWN ON THE SURVEY, THERE ARE NO OBSERVABLE, ABOVE GROUND ENCROACHMENTS BY THE IMPROVEMENTS ON THE SUBJECT PROPERTY UPON ADJOINING PROPERTIES, STREETS OR ALLEYS, OR BY THE IMPROVEMENTS ON ADJOINING PROPERTIES, STREETS OR ALLEYS UPON THE SUBJECT PROPERTY.

3. THE LOCATION OF EACH EASEMENT, RIGHT OF WAY, SERVITUDE, AND OTHER MATTER AFFECTING THE SUBJECT PROPERTY AND LISTED IN STEWART TITLE COMPANY, PRELIMINARY TITLE REPORT SUPPLEMENTAL NO. 1, ORDER NUMBER 1016646, DATED APRIL 27, 2012, WITH RESPECT TO THE SUBJECT PROPERTY, HAS BEEN SHOWN ON THE SURVEY, TOGETHER WITH THE APPROPRIATE RECORDING REFERENCES, TO THE EXTENT THAT SUCH MATTERS CAN BE LOCATED. THE PROPERTY SHOWN ON THE SURVEY IS THE PROPERTY DESCRIBED IN THAT TITLE REPORT.

4. THE SUBJECT PROPERTY HAS ACCESS TO AND FROM DULY DEDICATED AND ACCEPTED PUBLIC STREETS.

5. THE MEASURED BEARINGS AND DISTANCES SHOWN HEREON FORMS A MATHEMATICALLY CLOSED FIGURE WITH A MINIMUM LATITUDE AND DEPARTURE CLOSURE ERROR OF 1 IN 50,000.

6.THIS SITE LIES WITHIN WITHIN THE LIMITS OF FEMA MAP NUMBER 41005C0279D, WHICH IS NOT PRINTED SINCE THE ENTIRE MAP IS IN ZONE 'X' AS REITERATED ON FEMA MAP NUMBER 41005C1ND0A, EFFECTIVE DATE: JUNE 17, 2008.

7.SUBJECT PROPERTY IS ZONED, MUC-2 "MIXED USE CORRIDOR"

8. NO ORTHOPHOTOGRAPHY, PHOTOGRAMMETRIC MAPPING, LASER SCANNING, OR SIMILAR PRODUCTS WERE UTILIZED IN THE PREPARATION OF THIS SURVEY.

I HEREBY CERTIFY TO PACLAND; WAL-MART STORES, INC., A DELAWARE CORPORATION; WAL-MART REAL ESTATE BUSINESS TRUST, A DELAWARE STATUTORY TRUST; WAL-MART TRS, LLC, A DELAWARE LIMITED LIABILITY COMPANY; STEWART TITLE GUARANTY COMPANY;

THIS IS TO CERTIFY THAT THIS MAP OR PLAT AND THE SURVEY ON WHICH IT IS BASED WERE MADE IN ACCORDANCE WITH THE 2011 "MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/ACSM LAND TITLE SURVEYS", JOINTLY ESTABLISHED AND ADOPTED BY ALTA AND NSPS, AND INCLUDES ITEMS 1-6, 7(a), 7(b)(1), 7(c), 8, 9, 10(a), 11(b), 13, 14, 15-19, 20(a), 21 AND 22 OF TABLE 'A' THEREOF. THE FIELD WORK WAS COMPLETED ON JULY 9, 2012.

CES/NW MAKES NO WARRANTIES AS TO MATTER OF UNWRITTEN TITLE SUCH AS ACQUIESCENCE, ESTOPPEL, ADVERSE POSSESSION, ETC.

RYAN H. GODSEY
PROFESSIONAL LAND SURVEYOR
REGISTRATION NO.(OR) 65604

NARRATIVE

THE BASIS OF BEARINGS IS THE MONUMENTED CENTERLINE OF MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), AS ESTABLISHED BY MONUMENTS NO. 140 AND NO. 139 AS SHOWN HEREON PER SN 2010-176, SURVEY RECORDS, CLACKAMAS COUNTY, OREGON.

THE PURPOSE OF THIS SURVEY IS TO RETRACE THE BOUNDARIES AS SHOWN ON CLACKAMAS COUNTY SURVEY NUMBER SN2004-37. ALL MONUMENTS SHOWN WERE VISITED IN THE PROCESS OF THIS RETRACEMENT.

VERTICAL DATUM IS BASED ON A CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE RD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. GPS STA. LIBRARY 1990" ELEVATION = 452.739'

LEGAL DESCRIPTION PER TITLE REPORT

A TRACT OF LAND SITUATED IN THE SOUTHWEST QUARTER AND THE SOUTHEAST QUARTER OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON, SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOWS:

COMMENCING AT A THREE INCH BRASS DISK SET BY THE OREGON STATE HIGHWAY DEPARTMENT IN THE CENTERLINE OF MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213) AT ENGINEER'S STATION 31+00; THENCE SOUTH 73°27'47" EAST A DISTANCE OF 289.83 FEET TO THE NORTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-010378, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SAID POINT ALSO BEING ON THE SOUTHERLY RIGHT-OF-WAY LINE OF HILLTOP AVENUE; THENCE ALONG THE WESTERLY LINE OF SAID TRACT, SOUTH 27°39'59" EAST A DISTANCE OF 104.03 FEET TO THE SOUTHWEST CORNER OF SAID TRACT, AND BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE NORTHERLY LINE OF THOSE TRACTS DESCRIBED IN FEE NO. 72-08888 AND FEE NO. 69-09411, NORTH 78°20'26" EAST A DISTANCE OF 846.78 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 95-073144 AND FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 67°47'51" EAST A DISTANCE OF 59.75 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 96-010376 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE WESTERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 14°26'42" EAST A DISTANCE OF 407.81 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 96-007471, AND FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE COMMON LINE OF THOSE LANDS DESCRIBED IN FEE NO. 96-046001 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 62.63 FEET; THENCE SOUTH 23°58'58" EAST A DISTANCE OF 133.44 FEET TO THE SOUTHEASTERLY CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE SOUTHERLY LINE OF SAID TRACT, AND ALONG THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 98-044696 AND FEE NO. 99-004122, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°38'35" WEST A DISTANCE OF 125.26 FEET; THENCE ALONG SAID SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, AND THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 95-045260, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°19'45" WEST A DISTANCE OF 45.33 FEET; THENCE ALONG SAID SOUTHERLY LINE, AND THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 97-004501, AND FEE NO. 98-041108, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°29'26" WEST A DISTANCE OF 750.61 FEET TO A POINT IN THE NORTHEASTERLY RIGHT-OF-WAY OF BEAVERCREEK ROAD (MARKET ROAD NO. 11) (COUNTY ROAD NO. 398), SAID POINT BEING 30' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG SAID NORTHEASTERLY RIGHT-OF-WAY, NORTH 59°27'26" WEST A DISTANCE OF 206.63 FEET TO THE COMMON NORTHEASTERLY RIGHT-OF-WAY INTERSECTION OF SAID BEAVERCREEK ROAD AND MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), SAID POINT BEING 35' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE OF MOLALLA AVENUE; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, ALONG THE ARC OF A 5694.58 FOOT RADIUS CURVE TO THE RIGHT A DISTANCE OF 66.39 FEET, THROUGH A CENTRAL ANGLE OF 00°40'05" (THE LONG CHORD OF WHICH BEARS NORTH 27°43'34" WEST A DISTANCE OF 66.39 FEET); THENCE NORTH 27°23'32" WEST A DISTANCE OF 307.30 FEET; THENCE NORTH 62°36'28" EAST A DISTANCE OF 5.00 FEET TO A POINT 40 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE, SAID POINT ALSO BEING ON THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 97-022793, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE LEAVING SAID NORTHEASTERLY RIGHT-OF-WAY LINE, AND CONTINUING ALONG SAID SOUTHERLY TRACT LINE, NORTH 78°20'26" EAST A DISTANCE OF 176.19 FEET TO THE SOUTHEASTERLY CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, NORTH 27°39'59" WEST A DISTANCE OF 73.67 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 560,272 SQUARE FEET, OR 12.862 ACRES, MORE OR LESS.

RECORD DESCRIPTIONS

2004-091249 PARCEL 1
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD, SAID POINT BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 10.28 FEET; THENCE ALONG THE SOUTHERLY LINE THAT TRACT DESCRIBED IN FEE NO. 72-08888 DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 653.92 FEET TO THE SOUTHEAST CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, NORTH 12°38'23" WEST A DISTANCE OF 110.72 FEET TO THE NORTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 81-19662, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, SOUTH 88°29'47" EAST A DISTANCE OF 120.00 FEET TO THE NORTHEAST CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, SOUTH 12°38'23" EAST A DISTANCE OF 120.00 FEET TO A POINT ON THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, NORTH 88°29'47" WEST A DISTANCE OF 771.22 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 19,837 SQUARE FEET, OR 0.455 ACRES, MORE OR LESS.

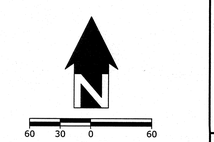
2004-091249 PARCEL 2
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 10.28 FEET TO THE TRUE POINT OF BEGINNING; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 67.85 FEET; THENCE NORTH 62°36'28" EAST A DISTANCE OF 5.00 FEET TO A POINT 40 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE, SAID POINT ALSO BEING ON THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 97-022793, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE LEAVING SAID NORTHEASTERLY RIGHT-OF-WAY LINE, AND CONTINUING ALONG SAID SOUTHERLY LINE, NORTH 78°20'26" EAST A DISTANCE OF 176.19 FEET TO THE SOUTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-010378, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF THOSE TRACTS DESCRIBED IN FEE NO. 72-08888 AND FEE NO. 69-09411, NORTH 78°20'26" EAST A DISTANCE OF 846.78 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 95-073144 AND FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, NORTH 67°47'51" EAST A DISTANCE OF 59.75 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 96-010376 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE WESTERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 14°26'42" EAST A DISTANCE OF 407.81 FEET TO THE COMMON CORNER OF THOSE TRACTS DESCRIBED IN FEE NO. 69-09411, FEE NO. 96-007471, AND FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT OF LAND DESCRIBED IN FEE NO. 69-09411, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 88°29'47" WEST A DISTANCE OF 322.36 FEET TO THE SOUTHEAST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 81-19662, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE EASTERLY LINE OF SAID TRACT DESCRIBED IN FEE NO. 81-19662, NORTH 1238'23" WEST A DISTANCE OF 120.00 FEET; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, NORTH 8829'47" WEST A DISTANCE OF 120.00 FEET; THENCE ALONG THE WESTERLY LINE OF SAID TRACT, SOUTH 12°38'23" EAST A DISTANCE OF 110.72 FEET TO THE SOUTHEAST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 72-08888, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF SAID TRACT DESCRIBED IN FEE NO. 72-08888, NORTH 8829'47" WEST A DISTANCE OF 653.92 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 256,397 SQUARE FEET, OR 5.886 ACRES, MORE OR LESS.

2004-091251
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD, SAID POINT BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE SOUTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 81-19662, FEE NO. 69-09411, AND FEE NO. 96-007471 DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 1156.21 FEET; THENCE SOUTH 23°58'58" EAST A DISTANCE OF 133.44 FEET TO THE SOUTHEASTERLY CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE SOUTHERLY LINE OF SAID TRACT, AND ALONG THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 98-044696 AND FEE NO. 99-004122, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°38'35" WEST A DISTANCE OF 125.26 FEET; THENCE ALONG SAID SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, AND THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 95-045260, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°19'45" WEST A DISTANCE OF 45.33 FEET; THENCE ALONG SAID SOUTHERLY LINE, AND THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 92-21067, FEE NO. 97-004501, AND FEE NO. 98-041108, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°29'26" WEST A DISTANCE OF 750.61 FEET TO A POINT IN THE NORTHEASTERLY RIGHT-OF-WAY OF BEAVERCREEK ROAD (MARKET ROAD NO. 11) (COUNTY ROAD NO. 398), SAID POINT BEING 30' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG SAID NORTHEASTERLY RIGHT-OF-WAY, NORTH 59°27'26" WEST A DISTANCE OF 206.63 FEET TO THE COMMON NORTHEASTERLY RIGHT-OF-WAY INTERSECTION OF SAID BEAVERCREEK ROAD AND MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), SAID POINT BEING 35' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE OF MOLALLA AVENUE; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, ALONG THE ARC OF A 5694.58 FOOT RADIUS CURVE TO THE RIGHT A DISTANCE OF 66.39 FEET, THROUGH A CENTRAL ANGLE OF 00°40'05" (THE LONG CHORD OF WHICH BEARS NORTH 27°43'34" WEST A DISTANCE OF 66.39 FEET); THENCE NORTH 27°23'32" WEST A DISTANCE OF 229.17 FEET TO THE TRUE POINT OF BEGINNING.



CONTAINING AN AREA OF 284,038 SQUARE FEET, OR 6.521 ACRES, MORE OR LESS.

NOTES

1. THIS SURVEY MAKES NO GUARANTEES THAT THE UNDERGROUND UTILITIES SHOWN ARE ALL THE UTILITIES IN THE AREA. THE UNDERGROUND UTILITIES SHOWN ARE BASED ON LOCATE PAINT MARKINGS IN THE FIELD AND AS-BUILT MAPPING. UTILITIES SHOWN MAY NOT BE IN THE EXACT LOCATION AS NOTED ON THIS SURVEY, BUT ARE LOCATED AS ACCURATELY AS POSSIBLE FROM PAINT MARKINGS ON THE GROUND. IF KNOWN, DEPTHS OF UTILITIES ARE AS SHOWN. THE GAS LINE DEPTHS HAVE NOT BEEN VERIFIED. NORTHWEST NATURAL DESIGN STANDARDS REQUIRE 12" TO 18" OF COVER FOR SERVICE LINES AND 30" TO 36" OF COVER FOR MAIN LINES IN THIS AREA. THE AGE AND CONDITION OF ALL UTILITIES IS UNKNOWN AND CANNOT BE CERTIFIED BY A LAND SURVEYOR. CITY OF OREGON CITY WATER DISTRIBUTION SYSTEM DESIGN STANDARDS REQUIRE A STANDARD MINIMUM COVER OVER BURIED WATER MAINS OF 36" FROM FINISH GRADE. WATERLINE DEPTHS WERE NOT VERIFIED AS A PART OF THIS SURVEY.

2. STORM DRAIN AND SANITARY SEWER LINES SHOWN ARE APPROXIMATE AND BASED ON VISIBLE ABOVE GROUND EVIDENCE AND AS-BUILT MAPS.

3. AS OF THE DATE OF THE SURVEY, A GEOTECHNICAL REPORT WAS NOT RECEIVED, THEREFORE THE CONDITIONS OF ALL DRIVING SURFACES, SHOULDERS, CURBS AND SIDEWALKS (ON-SITE AND ADJACENT ROADS) ARE NOT NOTED.

4. SPOT ELEVATIONS ARE SHOWN AT TOP OF CURB, EDGE OF PAVEMENT AND CENTERLINE OF ROADWAYS.

5. POSTED SPEED LIMIT ON BEAVERCREEK ROAD IS 35 MPH. POSTED SPEED LIMIT ON THE MOLALLA AVENUE IS 35 MPH.

6. VERTICAL DATUM IS BASED ON THE CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE RD., ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. PROPERTY DESCRIPTION

LOCATED IN THE S.E. 1/4 & S.W. 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, W.M. CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON

VERTICAL BENCHMARK

VERTICAL DATUM IS BASED ON THE CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE ROAD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. GPS STA. LIBRARY 1990".
ELEVATION = 452.739'.

SURVEY MONUMENT PROTECTION

EXISTING SURVEY MONUMENT ARE TO BE PROTECTED DURING CONSTRUCTION OR REPLACED IN ACCORDANCE WITH OREGON REVISED STATUTES 209.140 – 209.155.

GENERAL NOTES

1. ALL WORK AND MATERIALS SHALL COMPLY WITH ALL OREGON CITY REGULATIONS AND CODES AND O.S.H.A. STANDARDS, INCLUDING BUT NOT LIMITED TO THE CURRENT OREGON CITY ROAD DESIGN AND CONSTRUCTION STANDARDS, CLEAN WATER SERVICES DESIGN AND CONSTRUCTION STANDARDS, THE OREGON TRANSPORTATION COMMISSION STANDARDS FOR ACCESSIBLE PARKING DATED AUGUST 2018, AND THE APWA STANDARDS WHICH ARE HEREBY REFERENCED AS PART OF THESE PLANS.

2. THE DESIGN SHOWN IS BASED UPON THE ENGINEER'S UNDERSTANDING OF THE EXISTING CONDITIONS. THE PLAN DOES NOT REPRESENT A DETAILED FIELD SURVEY. THE EXISTING CONDITIONS SHOWN ON THIS PLAN SHEET ARE BASED UPON THE ALTA SURVEY PREPARED BY CES | NW, DATED JULY 9, 2012. THE CONTRACTOR IS RESPONSIBLE FOR VERIFYING FIELD CONDITIONS PRIOR TO BIDDING THE PROPOSED SITEWORK IMPROVEMENTS. IF CONFLICTS ARE DISCOVERED, THE CONTRACTOR SHALL NOTIFY THE OWNER/DEVELOPER PRIOR TO INSTALLATION OF ANY PORTION OF THE SITEWORK WHICH WOULD BE AFFECTED. IF CONTRACTOR DOES NOT ACCEPT EXISTING SURVEY, INCLUDING TOPOGRAPHY AS SHOWN ON THE PLANS, WITHOUT EXCEPTION, HE SHALL HAVE MADE, AT HIS OWN EXPENSE, A TOPOGRAPHIC SURVEY BY A REGISTERED LAND SURVEYOR AND SUBMIT IT TO THE OWNER FOR REVIEW.

3. CAUTION – NOTICE TO CONTRACTOR
THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR ELEVATION OF EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITIES, AND WHERE POSSIBLE, MEASUREMENTS TAKEN IN THE FIELD. THE INFORMATION IS NOT TO BE RELIED ON AS BEING EXACT OR COMPLETE. THE CONTRACTOR MUST CALL THE APPROPRIATE UTILITY COMPANY AT LEAST 48 HOURS BEFORE ANY EXCAVATION TO REQUEST EXACT FIELD LOCATION OF UTILITIES. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO RELOCATE ALL EXISTING UTILITIES WHICH CONFLICT WITH THE PROPOSED IMPROVEMENTS SHOWN ON THE PLANS.

4. IN THE EVENT OF CONFLICTS BETWEEN THE VARIOUS PROVISIONS OF THIS PLAN SET, THE MORE STRINGENT PROVISION APPLY.

5. ATTENTION: OREGON LAW REQUIRES YOU TO FOLLOW RULES ADOPTED BY THE OREGON UTILITY NOTIFICATION CENTER. THOSE RULES ARE SET FORTH IN OAR 952–001–0001 (ADOPTION OF MODEL RULES) THROUGH 952–001–0100 (RECORD KEEPING REQUIREMENTS). YOU MAY OBTAIN COPIES OF THE RULES BY CALLING THE CENTER.
NOTES: THE TELEPHONE NUMBER FOR THE OREGON UTILITY NOTIFICATION CENTER IS (503) 232–1987.

6. A ROAD CLOSURE WILL NO BE PERMITTED WITHOUT A SEPARATE ROAD CLOSURE PERMIT THROUGH WASHINGTON COUNTY TRAFFIC ENGINEERING.

7. THE CONTRACTOR, AT THE TIME OF MEETING WITH COUNTY INSPECTION STAFF FOR A PRE–CONSTRUCTION MEETING, SHALL PROVIDE THEIR WORK TRAFFIC CONTROL PLAN.

8. ACCOMMODATE ALL ROAD USERS AT ALL TIMES INCLUDING MOTORISTS, BICYCLISTS, PEDESTRIANS, AND THOSE WITH DISABILITIES OR IMPAIRMENTS. INSTALL AND MAINTAIN ADDITIONAL TEMPORARY SIGNING AND TRAFFIC CONTROL DEVICES FOR THE CONTROL OF NON–MOTORIZED VEHICLES AND PEDESTRIANS WHERE A REASONABLE VOLUME OF THESE USERS ARE EXPECTED AND WHERE WORK IS EXPECTED TO LAST LONGER THAN ONE HOUR. MAINTAIN SAFE ACCESSIBILITY OR PROVIDE SUITABLE ALTERNATE ROUTES IN, THROUGH, OR AROUND WORK AREAS.

9. ESTABLISH AND MAINTAIN WORK ZONE TRAFFIC CONTROL IN COMPLIANCE WITH THE OREGON TEMPORARY TRAFFIC CONTROL HANDBOOK FOR OPERATIONS OF THREE DAYS OR LESS (DECEMBER 2011) ANY TIME VEHICLE OR PEDESTRIAN TRAFFIC IS INFLUENCED BY THE WORK. FOR WORK REQUIRING DEVICES IN PLACE LONGER THAN THREE (3) DAYS, A SITE SPECIFIC TRAFFIC CONTROL PLAN BASED ON THE PRINCIPLES IN PART 6 OF THE MUTCD, THE OREGON SUPPLEMENT AND ODOT'S 2015 STANDARD DRAWINGS TM800 – TM871, IS REQUIRED. ALL TRAFFIC CONTROL DEVICES SHALL MEET OR EXCEED THE NCHRP 350 REQUIREMENTS FOR CRASHWORTHINESS. COMPLETED SIGNAL SHUT DOWN REQUESTS MUST BE RECEIVED BY THE COUNTY A MINIMUM OF 3 WORKING DAYS PRIOR TO ANY PROPOSED SIGNAL SHUT DOWN.

NOTES

1. TEMPORARY EROSION AND SEDIMENT CONTROL MEASURES AS SHOWN SERVE AS THE INTENDED BASIS FOR STORMWATER POLLUTION PREVENTION PLANNING. AS GRADING AND SITEWORK PROGRESS IS MADE AND WEATHER CONDITIONS CHANGE, THE CONTRACTOR IS EXPECTED TO MODIFY THE MEASURES AS NEEDED IN ACCORDANCE WITH THE PROJECT STORMWATER POLLUTION PREVENTION PLAN (SWPPP). MATERIAL QUANTITIES TO ADDRESS CHANGES IN TESC NEEDS ARE TO BE CONSIDERED IN BID.
2. WHEN A DOUBLE ROW OF SILT FENCE IS CALLED FOR ON THE PLANS, THE TWO ROWS SHALL HAVE A MINIMUM SPACING OF 3 FEET AND A MAXIMUM SPACING OF 5 FEET.
3. FINISH GRADE CONTOURS SHOWN REFLECT TOP OF FINISH SURFACE ELEVATIONS WITHIN THE ROADWAY AND TRANSITIONS TO TOP OF ROUGH FUTURE SUBGRADE WITHIN THE SITE DEVELOPMENT PADS IN PREPARATION FOR FUTURE DETAILED DEVELOPMENT PLAN APPROVAL FOR EACH OF THE PADS.
4. ROUGH GRADING AND FUTURE PAD FINISHED FLOOR ELEVATIONS ARE APPROXIMATE AND SUBJECT TO DETAILED DESIGN AND PERMIT APPROVAL. SLIGHT VARIATIONS IN PAD GRADING, INCLUDING BUILDING FINISHED FLOOR ELEVATIONS, MAY OCCUR WITH INDIVIDUAL PAD DETAILED DEVELOPMENT PLAN APPROVAL AND DETAILED DESIGN.

NOTES:

1. ONLY LIGHTS WITHIN THE RIGHT OF WAY HAVE BEEN STUDIED/MODELED AND ASSESSED FOR COMPLIANCE. EXISTING LIGHTS AND ISOLINES SHOWN ARE FOR REFERENCE ONLY.
2. THERE ARE NO AS-BUILTS AVAILABLE AT THE TIME OF THIS PRELIMINARY DESIGN. EXISTING LIGHT INFORMATION IS NOT VERIFIED IN THE FIELD. EXISTING LIGHTS ARE TO REMAIN AND BE PROTECTED UNLESS SHOWN OTHERWISE.
3. CONTRACTOR TO VERIFY EXISTING CONDITIONS PRIOR TO REPLACING OR INSTALLING NEW LIGHT FIXTURES.
4. NEW LIGHT POLES SHALL NOT BE LOCATED IN THE PATH OF TRAVEL AND MAINTAIN A 3' CLEARANCE FROM THE FRONT OF CURB PER CITY STANDARDS.
5. PLAN IS DIAGRAMMATIC.
6. SCOPE OF WORK IS ONLY FOR THE RIGHT-OF-WAY. PRIVATE/ONSITE IS EXCLUDED.
7. ALL STREET LIGHTING RELATED WORK AND MATERIALS SHALL COMPLY WITH CITY, COUNTY, AND OTHER APPLICABLE GOVERNING AUTHORITY REQUIREMENTS.

ALTA/ACSM SURVEY

LOCATED IN THE S.E. 1/4 & S.W. 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, W.M. CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON
REFERENCE: STEWART TITLE PRELIMINARY TITLE REPORT SUPPLEMENTAL NO. 1
ORDER NO. 1016646 DATED APRIL 27, 2012

CERTIFICATION FOR SURVEY

1. THE SURVEY WAS MADE ON THE GROUND DURING APRIL AND MAY OF 2012, AND CORRECTLY SHOWS THE AREA OF THE SUBJECT PROPERTY, THE LOCATION AND TYPE OF ALL BUILDINGS, STRUCTURES AND OTHER IMPROVEMENTS SITUATED ON THE SUBJECT PROPERTY.

2. EXCEPT AS SHOWN ON THE SURVEY, THERE ARE NO OBSERVABLE, ABOVE GROUND ENCROACHMENTS BY THE IMPROVEMENTS ON THE SUBJECT PROPERTY UPON ADJOINING PROPERTIES, STREETS OR ALLEYS, OR BY THE IMPROVEMENTS ON ADJOINING PROPERTIES, STREETS OR ALLEYS UPON THE SUBJECT PROPERTY.

3. THE LOCATION OF EACH EASEMENT, RIGHT OF WAY, SERVITUDE, AND OTHER MATTER AFFECTING THE SUBJECT PROPERTY AND LISTED IN STEWART TITLE COMPANY, PRELIMINARY TITLE REPORT SUPPLEMENTAL NO. 1, ORDER NUMBER 1016646, DATED APRIL 27, 2012, WITH RESPECT TO THE SUBJECT PROPERTY, HAS BEEN SHOWN ON THE SURVEY, TOGETHER WITH THE APPROPRIATE RECORDING REFERENCES, TO THE EXTENT THAT SUCH MATTERS CAN BE LOCATED. THE PROPERTY SHOWN ON THE SURVEY IS THE PROPERTY DESCRIBED IN THAT TITLE REPORT.

4. THE SUBJECT PROPERTY HAS ACCESS TO AND FROM DULY DEDICATED AND ACCEPTED PUBLIC STREETS.

5. THE MEASURED BEARINGS AND DISTANCES SHOWN HEREON FORMS A MATHEMATICALLY CLOSED FIGURE WITH A MINIMUM LATITUDE AND DEPARTURE CLOSURE ERROR OF 1 IN 50,000.

6.THIS SITE LIES WITHIN WITHIN THE LIMITS OF FEMA MAP NUMBER 41005C0279D, WHICH IS NOT PRINTED SINCE THE ENTIRE MAP IS IN ZONE 'X' AS REITERATED ON FEMA MAP NUMBER 41005C1ND0A, EFFECTIVE DATE: JUNE 17, 2008.

7.SUBJECT PROPERTY IS ZONED, MUC-2 "MIXED USE CORRIDOR"

8. NO ORTHOPHOTOGRAPHY, PHOTOGRAMMETRIC MAPPING, LASER SCANNING, OR SIMILAR PRODUCTS WERE UTILIZED IN THE PREPARATION OF THIS SURVEY.

I HEREBY CERTIFY TO PACLAND; WAL-MART STORES, INC., A DELAWARE CORPORATION; WAL-MART REAL ESTATE BUSINESS TRUST, A DELAWARE STATUTORY TRUST; WAL-MART TRS, LLC, A DELAWARE LIMITED LIABILITY COMPANY; STEWART TITLE GUARANTY COMPANY;

THIS IS TO CERTIFY THAT THIS MAP OR PLAT AND THE SURVEY ON WHICH IT IS BASED WERE MADE IN ACCORDANCE WITH THE 2011 "MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/ACSM LAND TITLE SURVEYS", JOINTLY ESTABLISHED AND ADOPTED BY ALTA AND NSPS, AND INCLUDES ITEMS 1-6, 7(a), 7(b)(1), 7(c), 8, 9, 10(a), 11(b), 13, 14, 15-19, 20(a), 21 AND 22 OF TABLE 'A' THEREOF. THE FIELD WORK WAS COMPLETED ON JULY 9, 2012.

CES/NW MAKES NO WARRANTIES AS TO MATTER OF UNWRITTEN TITLE SUCH AS ACQUIESCENCE, ESTOPPEL, ADVERSE POSSESSION, ETC.

RYAN H. GODSEY
PROFESSIONAL LAND SURVEYOR
REGISTRATION NO.(OR) 65604

NARRATIVE

THE BASIS OF BEARINGS IS THE MONUMENTED CENTERLINE OF MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), AS ESTABLISHED BY MONUMENTS NO. 140 AND NO. 139 AS SHOWN HEREON PER SN 2010-176, SURVEY RECORDS, CLACKAMAS COUNTY, OREGON.

THE PURPOSE OF THIS SURVEY IS TO RETRACE THE BOUNDARIES AS SHOWN ON CLACKAMAS COUNTY SURVEY NUMBER SN2004-37. ALL MONUMENTS SHOWN WERE VISITED IN THE PROCESS OF THIS RETRACEMENT.

VERTICAL DATUM IS BASED ON A CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE RD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. GPS STA. LIBRARY 1990" ELEVATION = 452.739'

LEGAL DESCRIPTION PER TITLE REPORT

A TRACT OF LAND SITUATED IN THE SOUTHWEST QUARTER AND THE SOUTHEAST QUARTER OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON, SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOWS:

COMMENCING AT A THREE INCH BRASS DISK SET BY THE OREGON STATE HIGHWAY DEPARTMENT IN THE CENTERLINE OF MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213) AT ENGINEER'S STATION 31+00; THENCE SOUTH 73°27'47" EAST A DISTANCE OF 289.83 FEET TO THE NORTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-010378, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SAID POINT ALSO BEING ON THE SOUTHERLY RIGHT-OF-WAY LINE OF HILLTOP AVENUE; THENCE ALONG THE WESTERLY LINE OF SAID TRACT, SOUTH 27°39'59" EAST A DISTANCE OF 104.03 FEET TO THE SOUTHWEST CORNER OF SAID TRACT, AND BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE NORTHERLY LINE OF THOSE TRACTS DESCRIBED IN FEE NO. 72-08888 AND FEE NO. 69-09411, NORTH 78°20'26" EAST A DISTANCE OF 846.78 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 95-073144 AND FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 67°47'51" EAST A DISTANCE OF 59.75 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 96-010376 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE WESTERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 14°26'42" EAST A DISTANCE OF 407.81 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 96-007471, AND FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE COMMON LINE OF THOSE LANDS DESCRIBED IN FEE NO. 96-046001 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 62.63 FEET; THENCE SOUTH 23°58'58" EAST A DISTANCE OF 133.44 FEET TO THE SOUTHEASTERLY CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE SOUTHERLY LINE OF SAID TRACT, AND ALONG THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 98-044696 AND FEE NO. 99-004122, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°38'35" WEST A DISTANCE OF 125.26 FEET; THENCE ALONG SAID SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, AND THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 95-045260, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°19'45" WEST A DISTANCE OF 45.33 FEET; THENCE ALONG SAID SOUTHERLY LINE, AND THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 92-21067, FEE NO. 97-004501, AND FEE NO. 98-041108, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°29'26" WEST A DISTANCE OF 750.61 FEET TO A POINT IN THE NORTHEASTERLY RIGHT-OF-WAY OF BEAVERCREEK ROAD (MARKET ROAD NO. 11) (COUNTY ROAD NO. 398), SAID POINT BEING 30' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG SAID NORTHEASTERLY RIGHT-OF-WAY, NORTH 59°27'26" WEST A DISTANCE OF 206.63 FEET TO THE COMMON NORTHEASTERLY RIGHT-OF-WAY INTERSECTION OF SAID BEAVERCREEK ROAD AND MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), SAID POINT BEING 35' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE OF MOLALLA AVENUE; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, ALONG THE ARC OF A 5694.58 FOOT RADIUS CURVE TO THE RIGHT A DISTANCE OF 66.39 FEET, THROUGH A CENTRAL ANGLE OF 00°40'05" (THE LONG CHORD OF WHICH BEARS NORTH 27°43'34" WEST A DISTANCE OF 66.39 FEET); THENCE NORTH 27°23'32" WEST A DISTANCE OF 307.30 FEET; THENCE NORTH 62°36'28" EAST A DISTANCE OF 5.00 FEET TO A POINT 40 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE, SAID POINT ALSO BEING ON THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 97-022793, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE LEAVING SAID NORTHEASTERLY RIGHT-OF-WAY LINE, AND CONTINUING ALONG SAID SOUTHERLY TRACT LINE, NORTH 78°20'26" EAST A DISTANCE OF 176.19 FEET TO THE SOUTHEASTERLY CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, NORTH 27°39'59" WEST A DISTANCE OF 73.67 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 560,272 SQUARE FEET, OR 12.862 ACRES, MORE OR LESS.

RECORD DESCRIPTIONS

2004-091249 PARCEL 1
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD, SAID POINT BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 10.28 FEET; THENCE ALONG THE SOUTHERLY LINE THAT TRACT DESCRIBED IN FEE NO. 72-08888 DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 653.92 FEET TO THE SOUTHEAST CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, NORTH 12°38'23" WEST A DISTANCE OF 110.72 FEET TO THE NORTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 81-19662, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, SOUTH 88°29'47" EAST A DISTANCE OF 120.00 FEET TO THE NORTHEAST CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, SOUTH 12°38'23" EAST A DISTANCE OF 120.00 FEET TO A POINT ON THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, NORTH 88°29'47" WEST A DISTANCE OF 771.22 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 19,837 SQUARE FEET, OR 0.455 ACRES, MORE OR LESS.

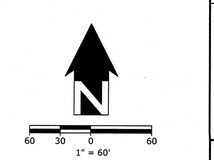
2004-091249 PARCEL 2
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 10.28 FEET TO THE TRUE POINT OF BEGINNING; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 67.85 FEET; THENCE NORTH 62°36'28" EAST A DISTANCE OF 5.00 FEET TO A POINT 40 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE, SAID POINT ALSO BEING ON THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 97-022793, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE LEAVING SAID NORTHEASTERLY RIGHT-OF-WAY LINE, AND CONTINUING ALONG SAID SOUTHERLY LINE, NORTH 78°20'26" EAST A DISTANCE OF 176.19 FEET TO THE SOUTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-010378, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF THOSE TRACTS DESCRIBED IN FEE NO. 72-08888 AND FEE NO. 69-09411, NORTH 78°20'26" EAST A DISTANCE OF 846.78 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 95-073144 AND FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 67°47'51" EAST A DISTANCE OF 59.75 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 96-010376 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE WESTERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 14°26'42" EAST A DISTANCE OF 407.81 FEET TO THE COMMON CORNER OF THOSE TRACTS DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT OF LAND DESCRIBED IN FEE NO. 69-09411, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 88°29'47" WEST A DISTANCE OF 322.36 FEET TO THE SOUTHEAST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 81-19662, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE EASTERLY LINE OF SAID TRACT DESCRIBED IN FEE NO. 81-19662, NORTH 1238'23" WEST A DISTANCE OF 120.00 FEET; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, NORTH 8829'47" WEST A DISTANCE OF 120.00 FEET; THENCE ALONG THE WESTERLY LINE OF SAID TRACT, SOUTH 12°38'23" EAST A DISTANCE OF 110.72 FEET TO THE SOUTHEAST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 72-08888, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF SAID TRACT DESCRIBED IN FEE NO. 72-08888, NORTH 8829'47" WEST A DISTANCE OF 653.92 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 256,397 SQUARE FEET, OR 5.886 ACRES, MORE OR LESS.

2004-091251
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD, SAID POINT BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE SOUTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 81-19662, FEE NO. 69-09411, AND FEE NO. 96-007471 DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 1156.21 FEET; THENCE SOUTH 23°58'58" EAST A DISTANCE OF 133.44 FEET TO THE SOUTHEASTERLY CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE SOUTHERLY LINE OF SAID TRACT, AND ALONG THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 98-044696 AND FEE NO. 99-004122, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°38'35" WEST A DISTANCE OF 125.26 FEET; THENCE ALONG SAID SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, AND THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 95-045260, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°19'45" WEST A DISTANCE OF 45.33 FEET; THENCE ALONG SAID SOUTHERLY LINE, AND THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 92-21067, FEE NO. 97-004501, AND FEE NO. 98-041108, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°29'26" WEST A DISTANCE OF 750.61 FEET TO A POINT IN THE NORTHEASTERLY RIGHT-OF-WAY OF BEAVERCREEK ROAD (MARKET ROAD NO. 11) (COUNTY ROAD NO. 398), SAID POINT BEING 30' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG SAID NORTHEASTERLY RIGHT-OF-WAY, NORTH 59°27'26" WEST A DISTANCE OF 206.63 FEET TO THE COMMON NORTHEASTERLY RIGHT-OF-WAY INTERSECTION OF SAID BEAVERCREEK ROAD AND MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), SAID POINT BEING 35' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE OF MOLALLA AVENUE; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, ALONG THE ARC OF A 5694.58 FOOT RADIUS CURVE TO THE RIGHT A DISTANCE OF 66.39 FEET, THROUGH A CENTRAL ANGLE OF 00°40'05" (THE LONG CHORD OF WHICH BEARS NORTH 27°43'34" WEST A DISTANCE OF 66.39 FEET); THENCE NORTH 27°23'32" WEST A DISTANCE OF 229.17 FEET TO THE TRUE POINT OF BEGINNING.



CONTAINING AN AREA OF 284,038 SQUARE FEET, OR 6.521 ACRES, MORE OR LESS.

BOUNDARY SURVEY

SHEET 1
OF 5

ALTA/ACSM SURVEY

LOCATED IN THE S.E. 1/4 & S.W. 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2
EAST, W.M. CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON
REFERENCE: STEWART TITLE PRELIMINARY TITLE REPORT SUPPLEMENTAL NO. 1
ORDER NO. 1016646 DATED APRIL 27, 2012

SPECIAL EXCEPTIONS

6. CITY LIENS, IF ANY, OF THE CITY OF OREGON CITY.

7. PERSONAL PROPERTY TAXES, IF ANY

8. COVENANTS, CONDITIONS, RESTRICTIONS AND EASEMENTS IN DECLARATION OF RESTRICTIONS, AND ANY AMENDMENTS THERETO:
RECORDED: JUNE 3, 1981
RECORDING NO.: 81015230
(PLOTTED BUILDING RESTRICTION)

9. AN EASEMENT CREATED BY JUDGEMENT, AND THE TERMS AND CONDITIONS THEREOF:
ENTERED: DECEMBER 20, 1996
SUIT NO.: CV96-09-321
IN FAVOR OF: THE CITY OF OREGON CITY
FOR: RIGHT OF WAY
AFFECTS: THE WESTERLY PORTION OF SAID PREMISES
(PLOTTED RIGHT-OF-WAY EASEMENT)

10. EASEMENT AND THE TERMS AND CONDITIONS THEREOF:
GRANTEE: LES SCHWAB PROFIT SHARING TRUST
PURPOSE: INGRESS AND EGRESS
AFFECTS: REFERENCE SAID DOCUMENT FOR PARTICULARS
RECORDED: OCTOBER 1, 2004
RECORDING NO.: 2004091594
(NOT PLOTTED - EASEMENT AREA NOT CLEARLY DEFINED)

11. ANY UNRECORDED LEASEHOLDS, RIGHT OF VENDORS AND HOLDERS OF SECURITY INTEREST ON PERSONAL PROPERTY INSTALLED UPON SAID PROPERTY, AND RIGHT OF TENANTS TO REMOVE TRADE FIXTURES AT THE EXPIRATION OF THE TERM.

12. EVIDENCE OF THE INDEMNITY AND AUTHORITY OF THE OFFICES OF WAL-MART STORES, INC., A DELAWARE CORPORATION TO EXECUTE THE FORTHCOMING INSTRUMENT MUST BE SUBMITTED.

NOTES

1. THIS SURVEY MAKES NO GUARANTEES THAT THE UNDERGROUND UTILITIES SHOWN ARE ALL THE UTILITIES IN THE AREA. THE UNDERGROUND UTILITIES SHOWN ARE BASED ON LOCATE PAINT MARKINGS IN THE FIELD AND AS-BUILT MAPPING. UTILITIES SHOWN MAY NOT BE IN THE EXACT LOCATION AS NOTED ON THIS SURVEY, BUT ARE LOCATED AS ACCURATELY AS POSSIBLE FROM PAINT MARKINGS ON THE GROUND. IF KNOWN, DEPTHS OF UTILITIES ARE AS SHOWN. THE GAS LINE DEPTHS HAVE NOT BEEN VERIFIED. NORTHWEST NATURAL DESIGN STANDARDS REQUIRE 12" TO 18" OF COVER FOR SERVICE LINES AND 30" TO 36" OF COVER FOR MAIN LINES IN THIS AREA. THE AGE AND CONDITION OF ALL UTILITIES IS UNKNOWN AND CANNOT BE CERTIFIED BY A LAND SURVEYOR. CITY OF OREGON CITY WATER DISTRIBUTION SYSTEM DESIGN STANDARDS REQUIRE A STANDARD MINIMUM COVER OVER BURIED WATER MAINS OF 36" FROM FINISH GRADE. WATERLINE DEPTHS WERE NOT VERIFIED AS A PART OF THIS SURVEY.

2. STORM DRAIN AND SANITARY SEWER LINES SHOWN ARE APPROXIMATE AND BASED ON VISIBLE ABOVE GROUND EVIDENCE AND AS-BUILT MAPS.

3. AS OF THE DATE OF THE SURVEY, A GEOTECHNICAL REPORT WAS NOT RECEIVED. THEREFORE THE CONDITIONS OF ALL DRIVING SURFACES, SHOULDERS, CURBS AND SIDEWALKS (ON-SITE AND ADJACENT ROADS) ARE NOT NOTED.

4. SPOT ELEVATIONS ARE SHOWN AT TOP OF CURB, EDGE OF PAVEMENT AND CENTERLINE OF ROADWAYS.

5. POSTED SPEED LIMIT ON BEAVERCREEK ROAD IS 35 MPH. POSTED SPEED LIMIT ON THE MOLALLA AVENUE IS 35 MPH.

6. VERTICAL DATUM IS BASED ON THE CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE RD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. Executive Summary

Project Description
The proposed project is located at 1367 Molalla Avenue, in the City of Oregon City, Clackamas County, Oregon. The site is located on Tax lots 32E05DB03300, 32E05DB03400, 32E05DB03200, 32E05DB03201, 32E05D00500, 32E05D00501, and 32E05D00602. The site is under the jurisdiction of Oregon City Public Works and the Clackamas County Water Environment Services (WES).

The existing property is approximately 12.86 acres (13.67 acres including the public access road) of scrub vegetation with isolated groups of trees and remnants of previously developed wrecking yard, gas station, and tavern.

The west portion of the existing site drains primarily on to the adjacent properties to the south. The east portion of the existing site drains primarily on to the adjacent properties to the east and northeast.

The proposed project includes a retail store (Parcel A), and a multi-family use (Parcel B), together with a public road through the site to provide access and utility service to each parcel (Parcel C), and a Quick Service Restaurant (QSR) (Parcel D). Parcels A, B, and D will receive interim rough grading, with finished conditions pending Detailed Development Plan approval for each of the parcels. The public access road includes a Right-of-Way (ROW) dedication at various widths and a 5-foot Public Utility Easement (PUE) along portions of the frontage of the parcels.

Design Criteria
The purpose of this report is to describe the project's stormwater management strategy and to show that the design meets the agency guidelines.

The standard stormwater requirements provided by Oregon City Public Works require detention, treatment, and infiltration. However, due to the presence of silty clay and a steep slope on the east side of the site, infiltration is not feasible on site.

This project utilizes the WES BMP Sizing Tool for designing the on-site stormwater facilities. The BMP Sizing Tool provides stormwater management design that will control flow durations ranging from 42% of the 2-year to the 10-year storm runoff as determined by the continuous model simulation integrated into the tool. Using this design methodology will provide the required treatment and flow control for the site, without the need for infiltration.

Proposed Drainage System
This project proposes to introduce a network of underground pipes, catch basins, curbs and gutters, to collect surface water runoff associated with the on-site and off-site public improvements. The proposed stormwater facilities will consist of lined rain gardens and lined detention ponds for water quality treatment and flow control. Stormwater detention will be required for both on-site private improvements and off-site public improvements. Space for detention of off-site public improvements is limited, and the detention facility cannot be installed within the right-of-way near the ultimate point of connection to the existing public storm system within the Natural Resource Overlay District (NROD) area in TL 500. Accordingly, the on-site stormwater facility will be sized to over-detain the on-site stormwater to compensate for public stormwater runoff as confirmed during the project's pre-application conference. The stormwater facilities will over detain and over treat these drainage basins to

account for the off-site public access road stormwater that will not be routed to the stormwater facilities.

Stormwater from Parcels A, B and C (Parcel C is the proposed public right-of-way within the main development area of TL3200, 3201, 3300, & 3400) will be routed to storm facilities in the southeast portion of the site, just north of the proposed public road, within the ROW. Stormwater for Parcel D will be routed to storm facilities within Parcel D. Parcel D stormwater will bypass the main storm facility after having received its own water quality and detention treatment. After being treated and detained, stormwater will be discharged to an existing storm pipe that discharges ultimately to Newell Creek. Outflows from the stormwater facilities will be regulated by flow control structures designed to release a peak flow rate not to exceed pre-developed runoff flow rates described above.

Conclusion

The proposed stormwater management systems for this project have been designed in accordance with regulatory criteria described above and consistent with sound engineering practice. This design has incorporated stormwater detention and stormwater quality BMP's. Therefore, no significant adverse impacts to the downstream stormwater system are expected because of the proposed development.

Site Drainage Analysis

Existing Conditions

The project site is located at 1367 Molalla Avenue, in the City of Oregon City, Clackamas County, Oregon. Tax lots 3300, 3201, & 3200 were previously developed as a wrecking yard between approximately 1953 and 2001/2002, with wrecking yard vehicle and structure removal occurring into 2005. Remnant surface features such as broken asphalt and foundations/concrete pads from prior wrecking yard operations are still visible in aerial photos of these parcels after 2005. A gasoline station and tavern formerly operated in the southwest portion of Tax Lot 3400. Each of these prior uses have been demolished and have been described in various Phase I & II Environmental Site Assessments. The southeast portion of TL 3400 and areas down-slope of the top of bluff on TL 3200 are covered in trees, while much of the remainder of the on-site properties exist in scrub vegetation or isolated groups of trees.

The public 18-inch storm line runs to the West of the subject property on the west side of Molalla Boulevard, and to the South of the subject property towards the North side of Beavercreek Road. There is an existing 48-inch stormwater outfall that discharges to Newell Creek. Our proposed stormwater runoff will utilize the existing outfall to Newell Creek.

Proposed Development

The proposed development includes one Quick Service Restaurant (QSR), a retail store, and a multi-family use, together with a public road through the site to provide access and utility service to each parcel. Stormwater from Parcels A, B and C will be routed to a lined rain garden which will then discharge to a lined detention pond for treatment of the 1-inch 24-hour water quality design storm and detention for the 10-year 24-hour storm event. The storm facilities for Parcels A, B and C will be a public storm facility within the public access road ROW. Stormwater from Parcel D will be routed to an on-site, private stormwater facility within Parcel D. The Parcel D storm facility will also consist of a lined rain garden discharging to a lined detention pond for treatment of the 1-inch 24-hour water quality design storm and detention for 42% of the 2-year to the 10-year 24-hour storm event. Following on-site treatment, runoff from Parcel D will bypass the public stormwater management system. The treated and detained stormwater from all the storm facilities will be routed through the off-site public access road to the existing discharge outfall to Newell Creek.

The public stormwater facility will over detain and over treat the on-site drainage basins to account for the off-site public access road stormwater that will not be routed to the stormwater facilities.

Soils

According to the NRCS Web Soil Survey, this site is composed mostly of Jory silty clay loam. Based on a geotechnical engineering report provided by Terracon Consultants, dated September 12th, 2022, the existing soil at the site consists of a surface layer of red clay surface soil. According to the Terracon report, groundwater was encountered from 4 to 20 feet below the surface. The Terracon report states that the groundwater observed in their borings appear to represent perched groundwater and does not

appear to be continuous in nature and groundwater fluctuations occur. See Appendix A of this report for additional information regarding soils and groundwater.

Drainage Basin Areas

The proposed Parcels A, B, and D, together with the public road are assumed in the full-build condition for the purposes of this analysis so that the various stormwater management facilities can be sized correctly. Parcels A, B, and D will undergo future Detailed Development Plan review in the future and will address any design changes from the assumptions in this report. While Parcel D will provide its own on-site storm facility with its DDP application, we've evaluated approximate sizing for this facility to determine impacts to the storm system downstream of Parcel D.

This project will consist of 5 separate drainage basins, as shown in the Drainage Basin Map in Appendix B. The project will create 377,077 sf of private impervious area and 89,144 sf of pervious area and will treat and detain 377,077 sf of impervious and 55,689 sf of pervious area. The project will create or improve 30,169 sf of public impervious and 7,003 sf of public pervious area.

On-site Private Basin 1:

This basin consists of Parcel A, the proposed retail stores. The basin is approximately 1.66 acres of impervious roof, pavement, and sidewalk (PRI-1) and 0.15 acres of pervious landscape area (PRP-1). The basin will be conveyed to the public rain garden and detention pond facilities for treatment and detention, where it will be mixed with stormwater from On-site Basin 2 and On-site Basin 3. The treated and detained stormwater will then be conveyed to the point of connection with the existing 48-inch public storm pipe prior to its existing discharge into a tributary of Newell Creek. The approximately 5,770 sf of existing pervious area on the west side of the parcel that currently drains off-site onto Molalla Ave will be reduced to 1,103 sf of pervious area draining off-site. This area will be graded and stabilized, but will not be treated or detained, as it is infeasible to collect, is not pollution generating, and will continue to naturally drain off site. Please see the Drainage Basin Map in Appendix B.

On-site Private Basin 2:

This basin consists of Parcel B, the proposed multi-family use. The basin is approximately 4.14 acres of impervious roof, pavement, and sidewalk (PRI-2) and 0.48 acres of pervious landscape area (PRP-2). The basin will be conveyed to the public rain garden and detention pond facilities for treatment and detention, where it will be mixed with stormwater from On-site Basin 1 and On-site Basin 3. The treated and detained stormwater will then be conveyed to the point of connection with the existing 48-inch public storm pipe prior to its existing discharge into a tributary of Newell Creek. The approximately 228,279 sf of existing pervious area on the east side of the parcel that currently drains east will be reduced to 16,275 sf of pervious area draining east. This area will be graded and stabilized, but will not be treated or detained, as it is infeasible to collect, is not pollution generating, and will continue to naturally drain off site. The east portion of Parcel B is a Geologic Hazard Area (steep slopes). The limits of disturbance do not get closer than 35 feet from the top of the steep slope near the edge of the Geologic Hazard Area. This portion of the site will remain as is, other than a natural surface pedestrian pathway, and existing drainage patterns here will continue.

On-site Private Basin 3:

This basin consists of Parcel D, the proposed QSR. The basin is approximately 1.21 acres of impervious roof, pavement, storm facilities, and sidewalk (PRI-3) and 0.32 acres of pervious landscape area (PRP-3).

The basin will be conveyed to a private rain garden and detention pond, located within Parcel D, for treatment and detention. The treated and detained stormwater will then bypass the public stormwater facility treating Basins 1, 2, & 3 and connect to the proposed storm system downstream from the public stormwater facility where it will then be conveyed to the point of connection with the existing 48-inch public storm pipe prior to its existing discharge into a tributary of Newell Creek. The approximately 182,811 sf of existing pervious area on the southwest side of the site that currently drains south will be reduced to 15,729 sf of pervious area draining off-site. This area will not be treated or detained, as it is infeasible to collect, is not pollution generating, and will continue to naturally drain off site.

The private stormwater management facility in Basin 4 will be designed concurrently with the detailed development of Parcel D. The analysis in this section is provided to show that the proposed Detailed Development Plan storm system can accommodate the future development of Parcel D. Were the Parcel D storm system to become overwhelmed by a large storm event, we recommend an overflow drainage structure be designed to capture the 100-year 24-hour storm event prior to it overtopping the planned facility and send that flow into the by-pass storm piping provided in the proposed public street. The storm pipes serving Parcel D will be sized to convey the 100-year 24-hour storm event for Basin 4/Parcel D as well.

Off-site Public Basin 1:
The proposed public access road runs through the site from Molalla Avenue to the southeast corner of the site. From the southeast corner of the site, the public access road snakes down to Beavercreek Road. This second portion of the public access road is off-site. The basin is approximately 0.71 acres of impervious pavement and sidewalk (PUI-1) and 0.4 acres of pervious landscape area (PUP-1). Space for detention of off-site public improvements is limited, and the detention facility cannot be installed within the right-of-way near the ultimate point of connection to the existing public storm system within the Natural Resource Overlay District (NROD) area in TL 500. Accordingly, the on-site public stormwater facilities will over detain and over treat the on-site basins to account for the off-site public access road stormwater that will not be routed to the stormwater facilities.

Stormwater in this basin will be captured in catch basins and conveyed to the existing outfall location adjacent to the off-site public access road, that discharges to Newell Creek.

Were this system to become overwhelmed by a large storm event that it was unable to convey or to become clogged, the catch basins would begin to overflow and flow down the off-site public access road to the south, avoiding the steep slope just east of the site and public access road, and overflow near the existing discharge point. To guard against such an overflow, inlets and inlet leads in this low point will be oversized to minimize the chances of overflow.

On-site Public Basin 2:
This basin consists of Parcel C, the on-site public access road. The basin is approximately 1.61 acres of impervious pavement, storm facilities, and sidewalk (PUI-2) and 0.28 acres of pervious landscape area (PUP-2). The basin will be conveyed to the public rain garden and detention pond facilities for treatment and detention, where it will be mixed with stormwater from On-site Basin 1 and On-site Basin 2. The treated and detained stormwater will then be conveyed to point of connection with the existing 48-inch public storm pipe prior to its existing discharge into a tributary of Newell Creek.

The public stormwater facility lies inside a small basin that, if it were to fill up, would overtop into the adjacent street at elevation 433 feet. A HydroCAD model was run (see Appendix C) to model this basin's capacity during a 100-year 24-hour storm event. During this storm event, the water surface elevation within this basin peaks at 428.93 feet. Therefore, the stormwater facility basin will contain the 100-year 24-hour storm event and any overflow into the street or steep slopes to the east is not expected to occur.

For analysis and sizing of BMPs, the project development area is broken into ten Drainage Management Areas (DMAs), as defined in the WES BMP Sizing Tool. The area and condition of the ten DMAs are shown in Table 1 below. See Appendix B for the Basin Map.

Table 1 –Drainage Management Areas

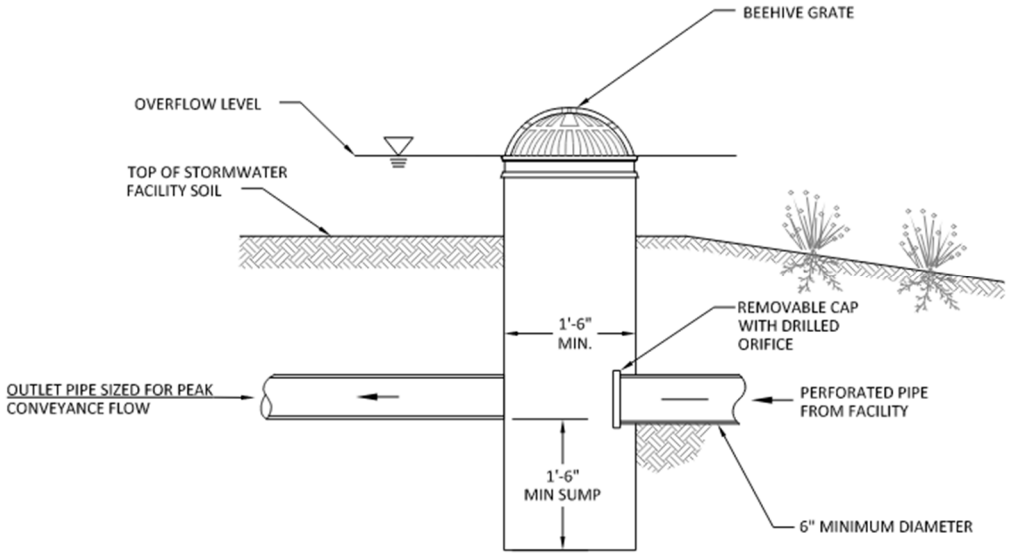
On-Site Basin Areas Draining to Public Storm Facilities			
Basin	**Area (sf)**	**Pre-developed Condition**	**Post-developed Condition**
PRI-1	72,516	Pervious - Forested	Impervious - Roof/Pavement
PRP-1	6,366	Pervious - Forested	Pervious - Landscape
PRI-2	180,369	Pervious - Forested	Impervious - Roof/Pavement
PRP-2	20,996	Pervious - Forested	Pervious - Landscape
PUI-2	70,148	Pervious - Forested	Impervious - Pavement
PUP-2	16,380*	Pervious - Forested	Pervious - Landscape
On-Site Basin Area Draining to Private Storm Facilities			
PRI-3	52,512	Pervious - Forested	Impervious – Roof/Pavement
PRP-3	13,774*	Pervious - Forested	Pervious - Landscape
Total On-site DMA*	***433,061***		
Off-Site Basin Area			
PUI-1	31,087	Pervious - Forested	Impervious - Pavement
PUP-1	6,085	Pervious - Forested	Pervious - Landscape
Total Off-site DMA	***37,172***		
Total DMA's*	***470,233***		

**DMA's do not include the stormwater facility area (BMP's)*

Modeling

The WES BMP Sizing Tool was utilized to assist with BMP sizing and calculations for the water quality, 2-year and 10-year storm events. Stormwater treatment facility's flow control structures were designed using the WES BMP Sizing Tool, for those events as well. Refer to BMP Sizing Report attached in Appendix D.

Flow control structure diagrams are shown in the figures below:



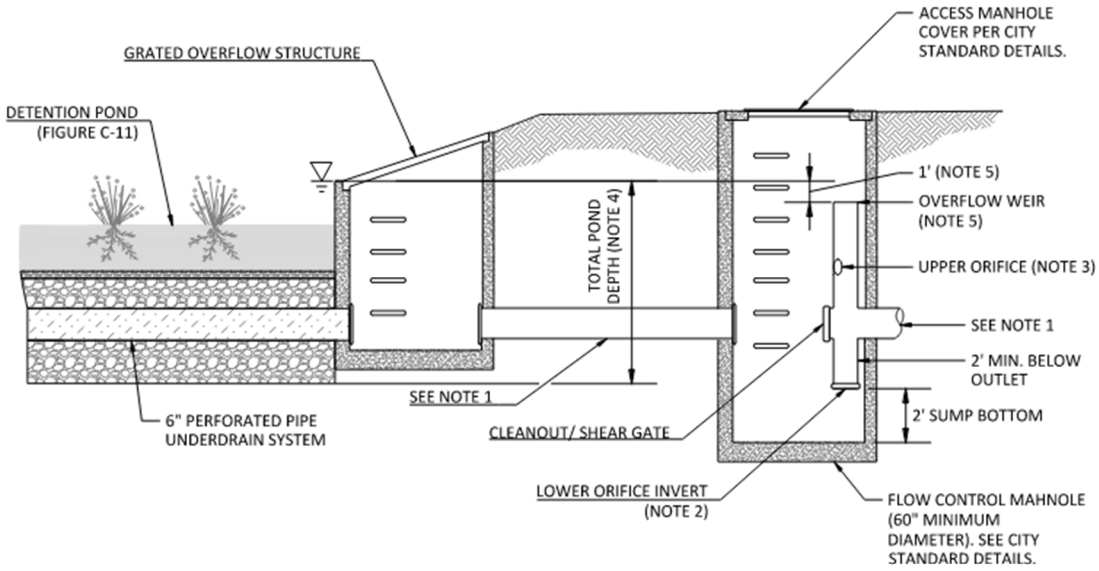


Figure 1 - Rain Garden Flow Control Structure

NOTES:

1. PIPE SIZED FOR PEAK DESIGN STORM AS DETERMINED BY ENGINEER .
2. LOWER ORIFICE: THE INVERT ELEVATION OF THE LOWER ORIFICE MUST BE AT, OR BELOW, THE POND BOTTOM (BOTTOM OF THE 3 FEET OF DRAIN ROCK & GROWING MEDIA).
3. UPPER ORIFICE: THE UPPER ORIFICE SHOULD BE AT AN ELEVATION 2/3 OF THE TOTAL POND DEPTH ABOVE THE POND BOTTOM.
4. TOTAL POND DEPTH, PER FACILITY SIZING MODEL, INCLUDES GROWING MEDIA, SEPARATION LAYER, AND DRAIN ROCK AS SHOWN ON FIGURE C-11.).
5. OVERFLOW WEIR: 1' BELOW MAXIMUM WATER ELEVATION OR TOP OF TOTAL POND DEPTH.

Figure 2 - Detention Pond Flow Control Structure

The required storm facility sizes and proposed facility sizes, according to the BMP Sizing Tool, are shown in Table 2.

Table 2 –Storm Facility Sizing

Rain Garden Storm Facilities		
Storm Facility	**Required Minimum Surface Area (sf)**	**Proposed Surface Area (sf)**
Public Rain Garden (lined)	5,685.5	6,000.0
Private Rain Garden (lined)	891.0	1,700.0
Detention Pond Storm Facilities		
Storm Facility	**Adequate Size?***	**Proposed Facility Volume (cf)**
Public Detention Pond (Lined)	Yes	2,911.8
Private Detention Pond (Lined)	Yes	1,027.7

**According to the BMP Sizing Tool (See Appendix D)*

Conclusion

The proposed stormwater management system for this project has been designed in accordance with regulatory criteria described above and is consistent with sound engineering practice. This design has incorporated stormwater quality treatment and detention BMPs to the maximum extent practicable. Therefore, no significant adverse impacts to surrounding surface water are expected as a result of the proposed improvements.

Terracon Project No. 82215043

Dear Mr. Rossman:

We have completed a Geotechnical Engineering evaluation for the above referenced project. Our services were performed in accordance with our Master Services Agreement dated November 20, 2017, and the Task Order dated June 22, 2021, and our Change Orders dated December 9, 2021, and June 10, 2022.

This report presents the findings of the subsurface exploration and provides geotechnical recommendations concerning slope stability, earthwork and the design and construction of foundations, floor slabs, and pavements for the proposed project.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report or if we may be of further service, please contact us.

Sincerely,
Terracon Consultants, Inc.

Ryan T. Houser, RG, CEG
Project Geologist

Kristopher T. Hauck, P.E.

INTRODUCTION

This report presents the results of our subsurface exploration and geotechnical engineering services performed for the proposed apartment complex, retail pads, and related pavements and utilities to be located at 1367 Molalla Avenue in Oregon City, Clackamas County, Oregon. The purpose of these services is to provide information and geotechnical engineering recommendations relative to:

- Subsurface soil conditions
- Groundwater conditions
- Site preparation and earthwork
- Demolition considerations
- Excavation considerations
- Slope stability considerations
- Foundation design and construction
- Floor slab design and construction
- Seismic site class per IBC
- Lateral earth pressures
- Pavement design and construction
- Slope hazard mitigation

The geotechnical engineering Scope of Services for this project included the advancement of one drilled boring and installation of a piezometer to monitor groundwater levels. Previous investigations at the site included advancement of 29 drilled borings and excavation of 68 test pits to depths ranging from approximately 3 to 50 feet below existing site grades. Logs of current and previous explorations are included in the **Exploration Results** section.

Maps showing the site and exploration locations are shown on **Figure 1 - Site Location** and **Figures 2 through 4 - Exploration Plans** in the **Figures** section. The results of the laboratory testing performed on soil samples obtained from the site during the field exploration are included on the boring logs and/or as separate graphs in the **Exploration Results** section.

SITE CONDITIONS

The following description of site conditions is derived from our site visit in association with the field exploration and our review of publicly available topographic maps.

Item	Description
Parcel Information	The project is located at 1367 Molalla Avenue in Oregon City, Clackamas County, Oregon. The site consists of 4 tax lots totaling approximately 12.86 acres. The approximate center of the site is located at the following coordinates: ■ Latitude: 45.3356° N ■ Longitude: 122.5881° W
Existing Improvements	Former buildings were removed, although several retaining walls, foundations, and floor slabs remained as of our last site visit in 2022.
Current Ground Cover	The majority of the site was covered with grass, blackberry bushes, and scattered trees. The eastern edge of the site was densely vegetated with trees and blackberry bushes.
Existing Topography	The majority of the site consisted of three graded benches that stepped down to the east. Each bench was nearly level to gently sloping and were separated by graded slopes up to about 10 feet high with gradients up to about 3 horizontal to 1 vertical (3H:1V). The eastern edge of the site drops steeply down at inclinations in the range of 1½H:1V to ½H:1V to the east toward Newell Creek. The overall slope system height is on the order of 200 feet in vertical drop. We understand that this steep slope area contains active and ancient landslide complexes and has been studied extensively by Portland State University geologists and other researchers.

We also collected photographs at the time of our field exploration program. Representative photos are provided in our **Photography Log**.

PROJECT DESCRIPTION

Our initial understanding of the project was provided in our proposal and was discussed during project planning. Several iterations of collaboration has transpired since the project was initiated, and our final understanding of the project conditions is as follows:

Item	Description
Information Provided	The following documents were provided to us: ■ "Site Plan," Sheet 1.11, prepared by Studio 15 Architecture, Inc., dated June 4, 2021. ■ "Preliminary Existing Conditions Survey," prepared by S&F Land Services, dated June 2021. ■ Oregon City Multi-Family Concept Grading Pavement Plans, Sheets C1.0, C2.0, C2.1, C3.0, C3.1, C4.00," prepared by Kimley-Horn, dated May 27, 2022. We were also provided the geotechnical report for the original planned structure.
Project Description	The proposed development is shown on the attached **Exploration Plans** (**Figures 2 through 4**), and includes construction of: ■ 15 multi-story (2 to 3) apartment buildings with a total of 236 dwelling units. Some of the buildings will incorporate ground level parking structures with apartments above. ■ Covered parking areas (carports). ■ 2 "pad-ready" development pads along the Molalla Avenue frontage for single story retail development. ■ A clubhouse building ■ Swimming pool Associated paved parking and drive lane areas
Building Construction	The proposed apartment and clubhouse buildings will be wood-framed with a slab-on-grade ground floor.
Finished Floor Elevation	The proposed apartment complex will be developed close to existing site grades. Final finish floor elevations are undetermined at this time.
Maximum Loads (Assumed)	■ Columns: 40 kips ■ Walls: 4 kips per linear foot (klf) ■ Slabs: 150 pounds per square foot (psf)
Below-Grade Structures	Development will include construction of a subsurface utility vault that will incorporate restrained retaining walls.
Free-Standing Retaining Walls	Development may include construction of free-standing retaining walls to accommodate grade changes along the eastern edge of the site and for the southeast road extension. We understand retaining walls up to 11 feet in height may be constructed.

Item	Description
Pavements	Paved driveway and parking will be constructed on the perimeter of the site. The Site Plan indicates parking will include 423 parking spaces. Both rigid (concrete) and flexible (asphalt) pavement sections will be incorporated into the final design. Anticipated traffic is as follows: ■ Autos/light trucks: 1,393 vehicles per day ■ Light delivery and trash collection vehicles: 20 vehicles per week ■ Tractor-trailer trucks: <5 vehicles per week The pavement design period is 20 years.
Estimated Start of Construction	Summer 2023

EXISTING GEOTECHNICAL REPORTS

Our Scope of Services is based on our understanding of the project as described by The Wolff Company and the expected subsurface conditions as described below. Terracon previously completed the following reports for the project site:

- "Preliminary Results of Slope Stability Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon," prepared by Zipper Zeman Associates (ZZA, now Terracon since 2005), dated July 3, 2002.
- "Subsurface Exploration and Geotechnical Engineering Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon," prepared by ZZA, dated February 13, 2004.
- "Preliminary Engineering Geology and Soil Engineering Report, Proposed Retail Development, Molalla Avenue and Beavercreek Road Oregon City, Oregon," prepared by Terracon, dated October 8, 2012.

GEOTECHNICAL CHARACTERIZATION

Geology

The site is located in the northern Willamette Valley geologic province, which consists of a structural trough between the Coastal Range and the Cascade Range. This basin is underlain by thick deposits of sand and gravel washed into it during the Pliocene epoch when the climate in the area was very dry. These granular deposits are locally covered by the Boring lavas (Qtb) in northwest Clackamas County.

Based on the *Oregon Geologic Data Standard v. 2.1* and Oregon Department of Geology and Mineral Industries *Geologic Map of the Oregon City 7.5' Quadrangle, Clackamas County, Oregon, 2009* this site is located within a geologic unit mapped as Tbc-Basalt of Canemah defined as flow or flows of grey medium-grained, olivine basalt. The Oregon Department of Geology and Mineral Industries (DOGAMI), Bulletin 99, *Geologic Map of the Canby and Oregon City Quadrangles, Oregon 1979*, maps the site as consisting of Boring lavas (Qtb), which it describes as Pliocene-Pleistocene lavas, light-gray, open-textured olivine basalt; flow structures common; includes some pyroclastic material of local extent; widely spaced joint pattern. Lavas and breccias have weathered to a residual red clay surface soil. Vertical exposures are susceptible to mass movement and deep bedrock sliding because of failure of underlying material (see the description below with clay materials within the Troutdale unit).

The Boring Lava deposits overly the Troutdale (Tpt), which are described as Pliocene sandstone and conglomerate; indurated beds and lenses of well-sorted sand and cobbly gravel with up to 30 percent quartzite clasts. Some sand originally composed of volcanic glass have altered to an impermeable high shrink-swell clay. The clay can be unstable and cause overlying competent units to fail by landslide. The publications indicate that on slopes where this clay layer daylights, one generally encounters a spring. Also, if layers dip out of the slope, it can become a failure plane for a slump or slump-earthflow when the pore water pressure has built up to a critical value on top of the clay layer.

Based on the *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs, O-06-27, 2006* and the *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon, IMS-26, 2009,* a mapped landslide was identified adjacent to the site to the east. The landslide is identified as a prehistoric or ancient landslide (movement greater than 150 years ago). This is defined by landslide features that are slightly eroded and there is no evidence of historic (recent in last 150 years) movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

The borings completed for this report and the previously referenced 2004 ZZA report are generally consistent with the above geologic mapping for the Boring Lavas/Basalt of Canemah, although the basalt has become deeply weathered in certain areas. The Troutdale unit was not encountered to the maximum depth of the borings at approximately 90½ feet below the ground surface. Although direct evidence of landslide features were not readily observed during our exploration programs for the 2004 report, we did observe the general headscarp area of the ancient landslide area during our 2012 and 2021 slope reconnaissances with the aid of the recent Lidar-based landslide maps.

Seismic Hazards

Seismic hazards resulting from earthquake motions can include slope stability, liquefaction, and surface rupture due to faulting or lateral spreading. Liquefaction is the phenomenon wherein soil strength is dramatically reduced when subjected to vibration or shaking.

We reviewed the Statewide Geohazards Viewer (HazVu) published by the Oregon Department of Geology and Mineral Studies (DOGAMI) and available online[1]. The viewer categorizes the expected earthquake shaking from light, moderate, strong, very strong, severe and violent; and the landslide susceptibility from low, moderate, high, and very high.

- Earthquake Liquefaction Hazard: Non-Liquefiable
- Expected Earthquake Shaking: Very Strong
- Landslide Susceptibility (due to earthquake): Low (Landsliding Unlikely) on the majority of the site, with Moderate (Landsliding Possible) to Very High (Existing Slide) on the eastern margin of the site. See **Engineering Geology Update** section for additional discussion.

Faults

The United States Geological Survey (USGS) Quaternary Fault and Fold Database of the United States published a report containing descriptions of nearby faults. Faults in the project vicinity include the Bolton fault (No.874), the Oatfield fault (No.875), and the Portland Hills fault (No.877). Published information pertaining to each fault or fault zone is provided in the following tables:

Bolton fault (Class B) No. 874

Information	Description
Length	9 km
Strike (degrees)	N53°W
Sense of Movement	Reverse
Dip Direction	SW
Slip-rate Category	Less than 0.2 mm/yr
Most recent prehistoric deformation	Undifferentiated Quaternary (<1.6 Ma)
Distance from Fault	1 km NE

[1] Statewide Geohazards Viewer (HazVu) published by the Oregon Department of Geology and Mineral Industries (DOGAMI) https://gis.dogami.oregon.gov/hazvu/

Oatfield fault (Class A) No. 875

Information	Description
Length	29 km
Strike (degrees)	N41W
Sense of Movement	Reverse, Right lateral
Dip Direction	NE
Slip-rate Category	Less than 0.2 mm/yr
Most recent prehistoric deformation	Undifferentiated Quaternary (<1.6 Ma)
Distance from Fault	2 km NNE

Portland Hills fault (Class A) No. 877

Information	Description
Length	49 km
Strike (degrees)	N37°W
Sense of Movement	Reverse, Right lateral
Dip Direction	SW
Slip-rate Category	Less than 0.2 mm/yr
Most recent prehistoric deformation	Undifferentiated Quaternary (<1.6 Ma)
Distance from Fault	5 km NE

Based on our review of the available fault information, the depth to bedrock, and the site's proximity to the nearest known faults, it is our opinion that the risk of surface rupture due to ground faulting is low.

Groundwater Conditions

We observed our explorations while drilling and after completion for the presence and level of groundwater. The water levels observed in the explorations are provided on the boring logs in **Exploration Results**, and are summarized below.

Boring Number	Approximate Ground Surface Elevation (feet) [1]	Observation Date	Approximate Depth to Groundwater/ Seepage while Drilling/Excavating (feet) [1]
02-B-3	447	October 29, 2001	19
02-B-22	451	March 7, 2002	20
02-MW-1	445	October 31, 2001	14
02-MW-1	445	November 2, 2001	8
02-MW-3	456	October 31, 2001	16
02-MW-3	456	November 2, 2001	17.5
02-MW-4	447	October 31, 2001	15
02-MW-4	447	November 2, 2001	11.2
02-MW-5	445	October 31, 2001	15
02-MW-5	445	November 2, 2001	11.5
02-TP-8	445	November 1, 2001	11
02-TP-43	426	March 4, 2002	9
02-TP-1A	435	March 1, 2002	9
02-TP-8A	442	March 1, 2002	6½
02-TP-12A	452	March 2, 2002	4
02-TP-20A	452	March 2, 2002	9½
21-B-1[2]	429	December 2021 – July 1, 2022	(not encountered)

1. Based on elevations obtained from the site topographic plan. Elevations may differ from those presented on the attached logs, which were based on a previous topographic map of the site.
2. A vibrating wire piezometer was installed at a depth of 30¾ feet below the ground surface (bgs), at the top of the basaltic bedrock.

Groundwater observations presented above appear to represent perched groundwater and does not appear to be continuous in nature. Groundwater level fluctuations occur due to seasonal variations in the amount of rainfall, runoff and other factors not evident at the time the borings were performed. Therefore, groundwater levels during construction or at other times in the life of the structure may be higher or lower than the levels indicated on the boring logs. The possibility of groundwater level fluctuations should be considered when developing the design and construction plans for the project.

A vibrating wire piezometer was installed in Boring 21-B-1 near the top of the descending slope at the east end of the site. The instrument was placed immediately above the basaltic andesite within the boring at a depth of approximately 30 feet bgs. As of the date of this report, groundwater

was not recorded by this instrument. Groundwater levels will continue to be measured within this boring throughout 2022.

GeoModel

We have developed a general characterization of the subsurface conditions based upon our review of the subsurface exploration, laboratory data, geologic setting and our understanding of the project. This characterization, termed GeoModel, forms the basis of our geotechnical calculations and evaluation of site preparation and foundation options. Conditions encountered at each exploration point are indicated on the individual logs. The individual logs can be found in the **Exploration Results** section and the GeoModel can be found on **Sections A-A', B-B', and C-C'** (Figures 10 through 12) in the **Figures** section of this report. As part of our analyses, we identified the following model layers within the subsurface profile.

Model Layer	Layer Name	General Description
1	**Existing Fill**	Topsoil, Asphalt, Silty Sand Fill, Clayey Silt Fill, Poorly Graded Gravel Fill, Gravelly Silt Fill placed during previous grading at the site
2	**Residual Soil (Native)**	Silt with trace Clay, Clayey Sand with Gravel, contains a variable amount of basaltic andesite boulders and cobbles
3	**Boring Lava**	Basaltic Andesite, fresh to slightly weathered, slightly fractured to very fractured

ENGINEERING GEOLOGY UPDATE

Terracon previously prepared an engineering geology report for the site, the results of which were presented in our referenced October 8, 2012, report. A copy of the 2012 report is attached at the end of this report. As part of our current scope of work, Terracon performed an engineering geology reconnaissance of the site slopes to document current site conditions. In addition, we reviewed aerial photographs, geologic maps, and geologic hazard maps produced since completion of our 2012 report, as detailed in the following sections.

RESEARCH

Geologic and Geologic Hazards Maps Review

Terracon reviewed the following geologic and geologic hazard maps that include the project site that have become available since our 2012 reports were issued:

- 2012 Oregon Department of Geology and Mineral Industries (DOGAMI) Open-File Report O-12-02, Lidar-based surficial geologic map and database of the greater Portland, Oregon, area, Clackamas, Columbia, Marion, Multnomah, Washington, and Yamhill Counties, Oregon,

and Clark County, Washington, by Lina Ma, Ian P. Madin, Serin Duplantis, and Kendra J. Williams

- 2013 DOGAMI Open-File Report O-13-08, Landslide hazard and risk study of northwestern Clackamas County, Oregon, by William J. Burns, Katherine A. Mickelson, Cullen B. Jones, Sean G. Pickner, Kaleena L. B. Hughes, and Rachel Sleeter.
- 2020 U.S. Geological Survey Scientific Investigations Map SIM-3443, Geologic map of the greater Portland metropolitan area and surrounding region, Oregon and Washington, by Wells, R.E., Haugerud, R.A., Niem, A.R., Niem, W.A., Ma, Lina, Evarts, R.C., O'Connor, J.E., Madin, I.P., Sherrod, D.R., Beeson, M.H., Tolan, T.L., Wheeler, K.L., Hanson, W.B., and Sawlan, M.G.

Based on our review, the geologic mapping presented on these maps is consistent with the mapped publications discussed in our referenced engineering geology report. The Landslide Hazard mapping (2013) indicates the eastern portion of the site, including the area of the headscarp and recommended setback, has a "high" potential for deep-seated landslides. The mapping indicates the eastern approximate quarter of the area of proposed development has a "moderate" potential for deep-seated landslides. The shallow landslide potential is "high" along the landslide scarp, and "moderate" directly above the landslide scarp. The slope between the site and the residential properties to the north also shows a "moderate" potential for shallow landslides. The landslide hazard susceptibility depicted on these maps is consistent with those discussed in the referenced reports prepared for the site. Portions of the landslide susceptibility maps showing the approximate site boundaries are attached as **Figure 6 - Deep Landslide Susceptibility Map** and **Figure 7 - Shallow Landslide Susceptibility Map** in the **Figures** section of this report.

Aerial Photograph Review

We reviewed aerial photographs taken from 2012 to 2020 showing the site to determine if significant changes to vegetation or slope configuration are apparent, which may indicate a slope failure. Our aerial photograph review did not identify any areas showing significant changes to vegetation or slope configuration on the scarp; however, two areas below the landslide headscarp showed vegetation patterns that appeared to be inconsistent with the surrounding areas. These areas were specifically visited during our site reconnaissance, which is described in the following section.

ENGINEERING GEOLOGIC RECONNAISSANCE

Terracon Consultants, Inc., Project Geologist Ryan T. Houser, CEG, performed a surface reconnaissance of the subject property and adjacent slopes on July 1, 2021.

The property was bordered to the west by Molalla Avenue, to the north by single-family and multi-family residences fronting on Hilltop Avenue, to the south by businesses fronting on Beavercreek

Road, and to the east by a forested natural area (Newell Creek Canyon Natural Area). The majority of the site consisted of three graded benches that stepped down to the east. Each bench was nearly level to gently sloping and were separated by graded slopes up to about 10 feet high with gradients up to about 3 horizontal to 1 vertical (3H:1V). Topography of the site is consistent with that shown on the existing conditions survey map provided by the client, as shown on **Figure 8 - Topographic Map** in the **Figures** section of this report. Photographs taken at the time of our reconnaissance are presented in the **Photography Log**.

The former building pad portions of the site above the headscarp were vacant and free of structures. This portion of the site appeared to be in a condition virtually identical to that described in the referenced reports. No signs of slope instability were noted on this portion of the site.

The headscarp appeared to be in a condition identical to that described in the referenced reports, with no indicators of additional failures noted during our reconnaissance. The slope was generally vegetated with fir and oak trees. The majority of the trees on the slope exhibited straight trunks. We noticed several recent treefalls on the slope, which appeared to be the result of wind and/or ice and not slope failures since the disturbed soils were limited to the root wads of the fallen trees.

The areas of variable vegetation noted during our review of aerial photographs were located near the toe of the headscarp within the natural area, as shown on **Figure 9 - Reconnaissance Plan** in the **Figures** section of this report. Both areas contained vegetation different than the surrounding trees. The soils in these areas had a higher moisture content than the slope or surrounding areas at the base of the headscarp. A spring was located at the base of the slope east of the northeastern property corner at the northern “wet soils” area shown on **Figure 9 - Reconnaissance Plan** in the **Figures** section of this report. Based on topography, these areas represent “sag ponds” that often form at the base of headscarps after a landslide. In this case, the sag ponds did not contain standing water but did maintain a higher soil moisture content than the surrounding soils that was not conducive to tree growth. The areas surrounding the sag ponds were vegetated with mature trees, with no indications of recent reactivations of the landslide.

SEISMIC CONSIDERATIONS

Seismic Design

The seismic design requirements for structures are based on the Seismic Design Category. Site Classification is required to determine the Seismic Design Category for a structure. The Site Classification is based on the upper 100 feet of the site profile defined by a weighted average value of either shear wave velocity, standard penetration resistance, or undrained shear strength in accordance with Section 20.4 of ASCE 7-16.

Description	Value
2019 Oregon Structural Specialty Code (OSSC) [1]	D[2]
Site Latitude	45.3360°N
Site Longitude	122.5880°W
S_S MCE_R Ground Motion for a Short Period [3]	0.812g
S_1 MCE_R Ground Motion for a 1-Second Period [3]	0.366g
PGA_M Site Modified Peak Ground Acceleration	0.451

1. Seismic site classification in general accordance with the *2019 Oregon Structural Specialty Code (OSSC)*, which refers to ASCE 7-16.
2. ASCE 7-16 requires a site soil profile extending to a depth of 100 feet be used for seismic site classification. Borings at this site were extended to a maximum depth of 90½ feet. The site properties below the boring depth to 100 feet were estimated based on our experience and knowledge of geologic conditions of the general area.
3. These values were obtained using online seismic design maps and tools available on the Applied Technology Council (ATC) website referenced in Section 1613.2.1 of the 2019 OSSC.

Liquefaction

Liquefaction is the phenomenon where saturated soils develop high pore-water pressures during seismic shaking and lose their strength characteristics. This phenomenon generally occurs in areas of high seismicity, where groundwater is shallow and loose granular soils or relatively low- to non-plastic fine-grained soils are present.

Based on their plasticity characteristics, the shallow high-plasticity soils are considered non-liquefiable. Based on their very stiff/dense nature, the underlying residual soil is considered non-liquefiable within the depths explored. In addition, relatively shallow, non-liquefiable basaltic andesite bedrock underlies the site. These findings are consistent with liquefaction hazard mapping for the site described above, which indicates soils at the site are non-liquefiable.

SLOPE STABILITY

Published geologic maps referenced in the attached October 8, 2012, engineering geology report and in the **Engineering Geology Update** section referenced above indicate that shallow surficial landsliding and debris flows are the primary types of slope failure in Newell Creek Canyon. In addition, recent hazard mapping indicates a moderate to high risk of deep-seated failures on the eastern portion of the site. It is our opinion that the previously discussed deep-seated failure of the mapped landslide was due to significant undercutting of lower-strength materials that underly the basalt by the ancestral Newell Creek. The resultant landslide debris covered the lower strength materials, forcing Newell Creek further to the east. In our opinion, the landslide debris and current location of Newell Creek provide a level of protection against erosion of the lower

strength materials, and a reduced risk of deep seated failures for the life of the current development.

Mechanics of Stability

Slope stability analyses take into consideration material strength, presence and orientation of weak layers, water (piezometric) pressures, surcharge loads, and the slope geometry. Mathematical computations are performed using computer-assisted simulations to calculate a Factor of Safety (FS). Minor changes to slope geometry, surface water flow and/or groundwater levels could result in slope instability. Reasonable FS values are dependent upon the confidence in the parameters utilized in the analyses performed, among other factors related to the project itself.

Geometric Analysis Results

Slope stability analyses were performed for the cross-section geometries based on the provided topographic map and publicly available topographic information. Parameters for the analyses were derived from our exploration program, experience, and laboratory tests. Stability analyses were conducted using the computer program Slope/W Version 7.16 developed by Geo-Slope International.

Unstable or Potentially Unstable Slopes

Based on the results of our field investigation, laboratory testing program, and geotechnical analysis, development of the site is considered feasible from a geotechnical viewpoint provided the conclusions and considerations provided herein are incorporated into the design and construction of the project. A horizontal acceleration of 0.225 (1/2 of the PGA_M) was entered for the seismic stability calculations.

The stability of the slopes at the cross-section locations shown on **Figure 3 –Exploration Plan East** were analyzed based on the provided topography, proposed grading, soil properties derived from our geotechnical exploration, laboratory test results and our experience with similar soil conditions. Soil and bedrock properties used in the analyses are shown below:

Material	Moist Unit Weight (pcf)	Drained Cohesion (psf)	Drained Friction Angle (degrees)
Existing Fill	120	0	27
Proposed Fill	125	0	32
Probable Slide Material	120	100	5
Residual Soil	125	250	30
Fresh Bedrock	150	500	45

Based on the analyses, the calculated FS for the critical surface identified in each section is shown below. It's important to note that these results incorporate the planned grading at this time. However, these analyses do not include any risk mitigation elements recommended later in this section.

Cross-Section	Minimum Calculated Factor-of-Safety for Slopes With Proposed Grading (no mitigation)	
	Static	Seismic
A-A'	1.65	1.06
B-B'	1.36	0.81
C-C'	1.91	1.17

The typically accepted minimum FS for static long-term slope stability supporting improvements is 1.5, and 1.15 for seismic slope stability. As shown in the table above, the proposed fill placement at the top of the slope will result in a factor of safety below the accepted minimums.

Slope Hazard Mitigation Recommendations

We evaluated multiple slope stability mitigation options including the use us deep foundations to support the proposed parking areas, the use of lightweight fill materials, and incorporating geogrid into the new structural fill areas. Based on our analyses, we recommend the proposed retaining wall incorporate a row of soldier piles to reinforce the top of the slope. The soldier piles should consist of a row of drilled shaft cast-in-place concrete piers. In addition, we recommend buildings setback a minimum of 35 feet from the top of the headscarp at the east end of the site. This line is shown on the attached **Figure 9 - Reconnaissance Map** and **Figure 3 - Exploration Plan East**. These piles should be embedded a minimum of 5 feet into the bedrock materials. Additional discussion of these recommendations is provided in **Geotechnical Overview** section. Details of the pile recommendations are provided in the **Soldier Pile Walls** section.

Incorporating these recommendations into the slope stability analyses results in the following calculated FS for the critical surfaces:

Cross-Section	Minimum Calculated Factor-of-Safety for Slopes Mitigated with Soldier Piles	
	Static	Seismic
A-A'	2.48	1.61
B-B'	2.87	1.56
C-C'	2.80	1.75

While these factors of safety appear significantly higher than the goal of design of 1.5 for static and 1.15 for seismic, these are the minimums provided the piles are embedded into the bedrock. Our analyses for piles not embedded into the bedrock did not achieve adequate factors of safety. As indicated in the preceding table, installation of soldier piles will provide sufficient increase in

the factors of safety. The slope stability results for each cross section representing the proposed grading incorporating soldier piles are included as **Figures 13 through 18** in the **Figures** section of this report.

GEOTECHNICAL OVERVIEW

Based on the results of our slope stability and engineering analyses, it is our opinion that the proposed development is feasible from the geotechnical engineering standpoint. The primary geotechnical considerations for development of the site are:

- **Existing Landslide Hazard:** As indicated above, we recommend the retaining wall at the east end of the site incorporate a row of soldier piles to aid in slope stability. The soldier piles should consist of drilled shaft cast-in-place concrete piers that are designed to provide lateral support for new fill and existing native soils (above the bedrock) west of the proposed retaining wall. Soldier pile recommendations are provided in the **Soldier Pile Walls** section. In addition, we recommend a 35-foot building setback from the top of the descending slope at the east end of the site (See **Figure 3 - Exploration Plan East**). The recommended setback is for habitable structures, so minor encroachments of parking and grading can be considered an acceptable use provided the following considerations are incorporated into final grading plans in order to minimize impact to slope stability:
  - Drainage should be controlled so that no water is discharged onto or over the descending slope.
  - Additional area loading of the top of the slope should be avoided (i.e. no additional fill that would increase weight at the top of the slope beyond that included in our slope stability model as shown on the proposed grading plan and cross sections).

- **Existing Fill Pad:** Up to about 7 feet of undocumented fill soils underlie the proposed parking and drive lane area at the east end of the site. “Undocumented” fill is fill that lacks documentation regarding its subgrade conditions or evaluation of compaction while it was placed. Due to the potential of long-term settlement of such fill, we recommend the fill be removed and replaced with properly placed and compacted structural fill as described in the **Earthwork** section. The approximate area of the fill (based on topography) is shown on **Figure 8 - Topographic Map**.

- **Previous Tank Excavations:** Several underground storage tanks related to a former gas station were removed from within the southwest corner of the site in the parking area southwest of southern building pad fronting on Molalla Avenue. The approximate location of the former gas station is shown on the **Figure 8 - Topographic Map**. We are not aware of density test or observation reports regarding the placement of backfill within the excavations remaining after removal of the tanks. Therefore, we recommend the fill be treated as “undocumented,” and that it be removed and replaced with properly placed and compacted

structural fill. The suitability of existing fill for reuse as structural fill can be evaluated during construction. As an alternative, additional test pits could be advanced into the existing fill to determine if it can be reused as structural fill.

- **Moisture Sensitivity:** The near surface, silt soils could become unstable with typical earthwork and construction traffic, especially after precipitation events. The effective drainage should be completed early in the construction sequence and maintained after construction to avoid potential issues. If possible, the grading should be performed during the warmer and drier times of the year. If grading is performed during the winter months, an increased risk for possible undercutting and replacement of unstable subgrade will persist. Additional site preparation recommendations, including subgrade improvement and fill placement, are provided in the **Earthwork** section.

The **General Comments** section provides an understanding of the report limitations.

EARTHWORK

Earthwork is anticipated to include demolition, clearing and grubbing, excavations, and fill placement. The following sections provide recommendations for use in the preparation of specifications for the work. Recommendations include critical quality criteria, as necessary, to render the site in the state considered in our geotechnical engineering evaluation for foundations, floor slabs, and pavements.

Site Preparation

Prior to placing new fill, existing vegetation and root mat should be removed. Complete stripping of the topsoil should be performed in the proposed building and parking/driveway areas. Existing pavements, foundations, subsurface structures, and utilities remaining from previous development should be removed in their entirety. Existing fill soils should be removed and replaced with controlled structural fill.

The subgrade should be proof rolled with an adequately loaded vehicle such as a fully-loaded tandem-axle dump truck. The proof rolling should be performed under the direction of the Geotechnical Engineer. Areas excessively deflecting under the proof roll should be delineated and subsequently addressed by the Geotechnical Engineer. Such areas should either be removed or modified by stabilizing with cement. Excessively wet or dry material should either be removed or moisture conditioned and recompacted.

Terracon completed an Environmental Site Assessment (ESA) report for the project under separate cover. The ESA indicates contaminated soils within portions of the former wrecking yard at the east end of the site near the top of the descending slope. Any contaminated soils removed

near the top of the descending slope during remediation practices should be replaced with properly controlled, low-permeability structural fill soils. A former fueling station was also identified on the western portion of the site. We understand that the fuel tank was previously removed and the resulting excavation was loosely backfilled with excavated soils. The contractor should be aware that earthwork activities associated with the proposed development may encounter contaminated native and/or undocumented fill soils within these areas. The ESA reports completed for the site should be thoroughly reviewed prior to the start of earthwork activities.

Existing Fill

As noted in **Geotechnical Characterization**, many of the explorations encountered existing fill to depths of up to about 7 feet. The consistency/density of the fill is highly variable. Therefore, we recommend the fill be completely removed and replaced with properly placed and compacted structural fill in proposed building and pavement areas. Removal of undocumented fill soils should extend a minimum of 10 feet beyond building and pavement areas. Once materials have been removed, the entire area should be proof rolled with heavy, rubber tire construction equipment, to aid in delineating areas of soft or otherwise unsuitable soil. Areas of soft or otherwise unsuitable material should be undercut and replaced with either new structural fill or suitable, existing on site materials. Once unsuitable materials have been remediated, and the subgrade has passed the proof roll test, the existing and undocumented fill that was removed can be evaluated for reuse as structural fill.

Subgrade Stabilization

For this site, improvement of working surfaces subgrade with Portland cement could be considered. Cement amendment of soils should be performed by a pre-qualified contractor having experience with successfully stabilizing subgrades in the project area on similar sized projects with similar soil conditions.

For planning purposes, we estimate that pavement subgrades would need to be amended with an approximate 7 to 8 percent cement by dry weight in order to provide a stabilized subgrade for both wet weather and pavement support. We recommend a cement-amendment design be prepared during the full design phase to refine this estimate for construction specifications.

Fill Material Types

Fill required to achieve design grades should be classified as select fill, structural fill and general fill. Select fill is material used below turbine foundations, whereas structural fill is material used above or within 10 feet of foundation structures and within roadways or constructed slopes. General fill is material used to achieve grade outside of these structural areas. Fill materials used should meet the following material property requirements:

Soil Type[1]	Specification	Acceptable Parameters (for Structural Fill)
Common Fill	2021 ODOT Standard Specifications for Construction (ODOT SSC) Section 00330.13 Selected General Backfill[2]	All locations across the site, except beneath footing pads Dry weather only
Granular Common Fill	ODOT SSC Section 0030.13 Selected General Backfill[3]	All locations across the site. Dry weather only
Select Fill	ODOT SSC Section 00330.14 Selected Granular Backfill[4]	All locations across the site. Wet and Dry weather acceptable.
Crushed Aggregate Base (CAB)	ODOT SSC Section 02630.10 Dense Graded Aggregate (2”-0 to 1”-0) with the modification that less than 8% pass the No. 200 sieve as determined by ASTM D 422.	Finished base course materials for roadways and footing subgrades.
Lean Concrete (Mud-Mat)	ODOT SSC 00442 with the exception that minimum 28-day strength shall be 500 psi. Higher strength minimums may be specified by the Structural Engineer as needed.	All locations underneath mat foundations and spread foundations.

1. Controlled, compacted fill should consist of approved materials that are free (free = less than 3% by weight) of organic matter and debris (i.e. wood sticks greater than ½ inch in diameter). Frozen material should not be used, and fill should not be placed on a frozen subgrade. A sample of each material type should be submitted to the geotechnical engineer for evaluation.
2. Material should have a liquid limit less than 40 and plasticity index of less than 10.
3. Material should have less than 50% passing the No. 200 sieve and be non-plastic in nature.
4. Material should have a maximum aggregate size of 2 inches and no more than 8% passing the No. 200 sieve by weight determined by ASTM D 422.
5. Decomposed bedrock and basalt bedrock can be used as fill/backfill provided it is properly processed to a “soil-like consistency” to meet the USCS Classifications presented above with no pieces larger than 2 inches.
6. The contractor shall select the appropriate material for use based on the current and forecasted weather conditions at the time of construction.

Fill Compaction Requirements

Recommended compaction and moisture content criteria for structural fill materials are as follows:

Material Type and Location	Minimum Compaction Requirement (%)	Range of Moisture Contents for Compaction	
		Minimum	Maximum
Common Fill	**Per the Modified Proctor Test (ASTM D 1557)**		
All locations where used	95	-2%	+2%
Select Fill & CAB	**Per the Modified Proctor Test (ASTM D 1557)**		

Material Type and Location	Minimum Compaction Requirement (%)	Range of Moisture Contents for Compaction	
		Minimum	Maximum
All locations where used (e.g. beneath foundations, slabs, pavements)	95	-4%	+2%

Utility Trench Backfill

For low permeability subgrades, utility trenches are a common source of water infiltration and migration. Utility trenches penetrating beneath the buildings should be effectively sealed to restrict water intrusion and flow through the trenches, which could migrate below the buildings. The trench should provide an effective trench plug that extends at least 5 feet from the face of building exteriors. The plug material should consist of cementitious flowable fill or low permeability clay. The trench plug material should be placed to surround the utility line. If used, the clay trench plug material should be placed and compacted to comply with the water content and compaction recommendations for structural fill stated previously in this report.

Grading and Drainage

All grades must provide effective drainage away from the buildings during and after construction and should be maintained throughout the life of the structure. Water retained next to the buildings can result in soil movements greater than those discussed in this report. Greater movements can result in unacceptable differential floor slab and/or foundation movements, cracked slabs and walls, and roof leaks. The roofs should have gutters/drains with downspouts that discharge onto splash blocks at a distance of at least 10 feet from the buildings.

Exposed ground should be sloped and maintained at a minimum 5% away from the buildings for at least 10 feet beyond the perimeter of the buildings. Locally, flatter grades may be necessary to transition ADA access requirements for flatwork. After building construction and landscaping have been completed, final grades should be verified to document effective drainage has been achieved. Grades around the structure should also be periodically inspected and adjusted, as necessary, as part of the structure's maintenance program. Where paving or flatwork abuts the structure, a maintenance program should be established to effectively seal and maintain joints and prevent surface water infiltration.

Earthwork Construction Considerations

Shallow excavations for the proposed structures are anticipated to be accomplished with conventional construction equipment. Upon completion of filling and grading, care should be taken to maintain the subgrade water content prior to construction of floor slabs. Construction traffic over the completed subgrades should be avoided. The site should also be graded to prevent ponding of surface water on the prepared subgrades or in excavations. Water collecting over or

adjacent to construction areas should be removed. If the subgrade freezes, desiccates, saturates, or is disturbed, the affected material should be removed, or the materials should be scarified, moisture conditioned, and recompacted prior to floor slab construction.

As a minimum, excavations should be performed in accordance with OSHA 29 CFR, Part 1926, Subpart P, “Excavations” and its appendices, and in accordance with any applicable local, and/or state regulations.

Construction site safety is the sole responsibility of the contractor who controls the means, methods, and sequencing of construction operations. Under no circumstances shall the information provided herein be interpreted to mean Terracon is assuming responsibility for construction site safety, or the contractor's activities; such responsibility shall neither be implied nor inferred.

Construction Observation and Testing

The earthwork efforts should be monitored under the direction of the Geotechnical Engineer. Monitoring should include documentation of adequate removal of vegetation and topsoil, proof rolling, and mitigation of areas delineated by the proof roll to require mitigation.

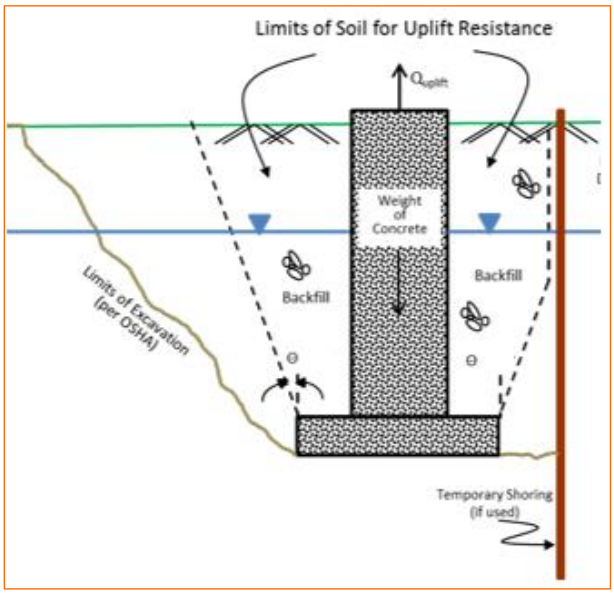
Each lift of compacted fill should be tested, evaluated, and reworked, as necessary, until approved by the Geotechnical Engineer prior to placement of additional lifts. Each lift of fill should be tested for density and water content at a frequency of at least one test for every 2,500 square feet of compacted fill in the building areas and 5,000 square feet in pavement areas. One density and water content test should be performed for every 50 linear feet of compacted utility trench backfill. In areas of foundation excavations, the bearing subgrade should be evaluated under the direction of the Geotechnical Engineer. If unanticipated conditions are encountered, the Geotechnical Engineer should prescribe mitigation options.

In addition to the documentation of the essential parameters necessary for construction, the continuation of the Geotechnical Engineer into the construction phase of the project provides the continuity to maintain the Geotechnical Engineer’s evaluation of subsurface conditions, including assessing variations and associated design changes.

SHALLOW FOUNDATIONS

If the site has been prepared in accordance with the requirements noted in the **Earthwork** section, the following design parameters are applicable for shallow foundations.

Design Parameters – Compressive Loads

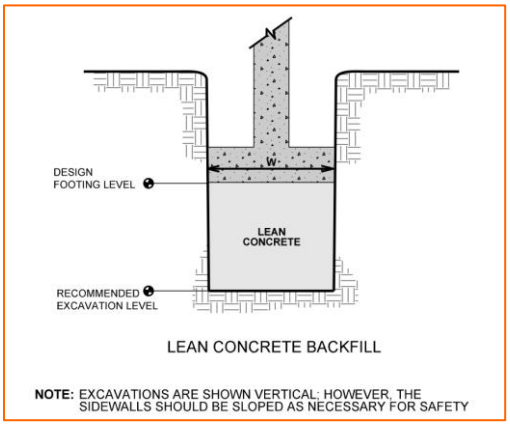


Item	Description
Maximum Net Allowable Bearing Pressure[1,2]	2,000 psf
Required Bearing Stratum[3]	Structural fill or undisturbed native residual soil
Minimum Foundation Dimensions	Columns: 24 inches Continuous: 18 inches
Ultimate Passive Resistance[4] **(equivalent fluid pressures)**	150 pcf (cohesive backfill) 360 pcf (granular backfill)
Ultimate Coefficient of Sliding Friction[5]	0.30 (native silt soils) 0.50 (granular structural fill material)
Minimum Embedment below Finished Grade[6]	Exterior footings in unheated areas: 12 inches Exterior footings in heated areas: 12 inches Interior footings in heated areas: 12 inches
Estimated Total Settlement from Structural Loads[2]	Less than about 1 inch
Estimated Differential Settlement[2,7]	About ⅔ of total settlement

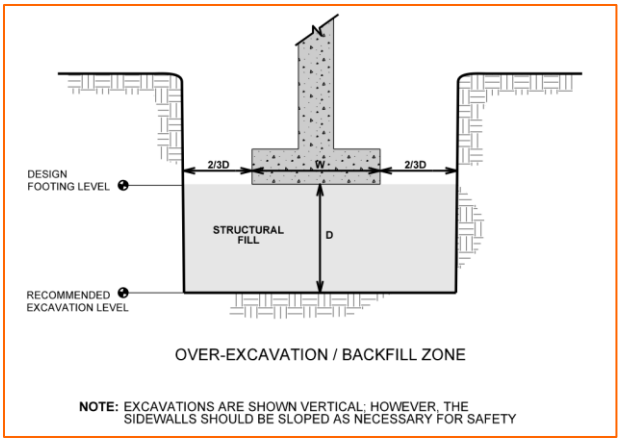
1. The maximum net allowable bearing pressure is the pressure in excess of the minimum surrounding overburden pressure at the footing base elevation. An appropriate factor of safety has been applied. Values assume that exterior grades are no steeper than 20% within 10 feet of structure.
2. Values provided are for maximum loads noted in **Project Description**.
3. Unsuitable or soft soils should be overexcavated and replaced per the recommendations presented in the **Earthwork**.
4. Use of passive earth pressures require the sides of the excavation for the spread footing foundation to be nearly vertical and the concrete placed neat against these vertical faces or that the footing forms be removed and compacted structural fill be placed against the vertical footing face.
5. Can be used to compute sliding resistance where foundations are placed on suitable soil/materials. Should be neglected for foundations subject to net uplift conditions.
6. Embedment necessary to minimize the effects of frost and/or seasonal water content variations. For sloping ground, maintain depth below the lowest adjacent exterior grade within 5 horizontal feet of the structure.
7. Differential settlements are as measured over a span of 50 feet.

Design Parameters - Uplift Loads

Uplift resistance of spread footings can be developed from the effective weight of the footing and the overlying soils. As illustrated on the subsequent figure, the effective weight of the soil prism defined by diagonal planes extending up from the top of the perimeter of the foundation to the ground surface at an angle, θ, of 20 degrees from the vertical can be included in uplift resistance. The maximum allowable uplift capacity should be taken as a sum of the effective weight of soil plus the dead weight of the foundation, divided by an appropriate factor of safety. A maximum



total unit weight of 100 pcf should be used for the backfill. This unit weight should be reduced to 40 pcf for portions of the backfill or natural soils below the groundwater elevation.



Foundation Construction Considerations

As noted in **Earthwork**, the footing excavations should be evaluated under the direction of the Geotechnical Engineer. The base of all foundation excavations should be free of water and loose soil, prior to placing concrete. Concrete should be placed soon after excavating to reduce bearing soil disturbance. Care should be taken to prevent wetting or drying of the bearing materials during construction. Excessively wet or dry material or any loose/disturbed material in the bottom of the footing excavations should be removed/reconditioned before foundation concrete is placed.

If unsuitable bearing soils are encountered at the base of the planned footing excavation, the excavation should be extended deeper to suitable soils, and the footings could bear directly on these soils at the lower level or on lean concrete backfill placed in the excavations. This is illustrated on the sketch below.

Overexcavation for structural fill placement below footings should be conducted as shown below. The overexcavation should be backfilled up to the footing base elevation, with structural fill placed, as recommended in the **Earthwork** section.

FLOOR SLABS

Depending upon the finished floor elevation, unsuitable, undocumented fills may be encountered at the floor slab subgrade levels. These soils should be replaced with structural fill so the floor slab is supported on suitable natural soils or newly placed structural fill.

Design parameters for floor slabs assume the requirements for **Earthwork** have been followed. Specific attention should be given to positive drainage away from the structure and positive drainage of the aggregate base beneath the floor slab.

Floor Slab Design Parameters

Item	Description
Floor Slab Support [1]	Minimum 6 inches of free-draining (less than 6% passing the U.S. No. 200 sieve) crushed aggregate compacted to at least 95% of ASTM D 698 [2, 3]
Estimated Modulus of Subgrade Reaction [2]	100 pounds per square inch per inch (psi/in) for point loads

1. Floor slabs should be structurally independent of building footings or walls to reduce the possibility of floor slab cracking caused by differential movements between the slab and foundation.
2. Modulus of subgrade reaction is an estimated value based upon our experience with the subgrade condition, the requirements noted in **Earthwork**, and the floor slab support as noted in this table. It is provided for point loads. For large area loads the modulus of subgrade reaction would be lower.
3. Free-draining granular material should have less than 5% fines (material passing the No. 200 sieve). Other design considerations such as cold temperatures and condensation development could warrant more extensive design provisions.

The use of a vapor retarder should be considered beneath concrete slabs on grade covered with wood, tile, carpet, or other moisture sensitive or impervious coverings, or when the slab will support equipment sensitive to moisture. When conditions warrant the use of a vapor retarder, the slab designer should refer to ACI 302 and/or ACI 360 for procedures and cautions regarding the use and placement of a vapor retarder.

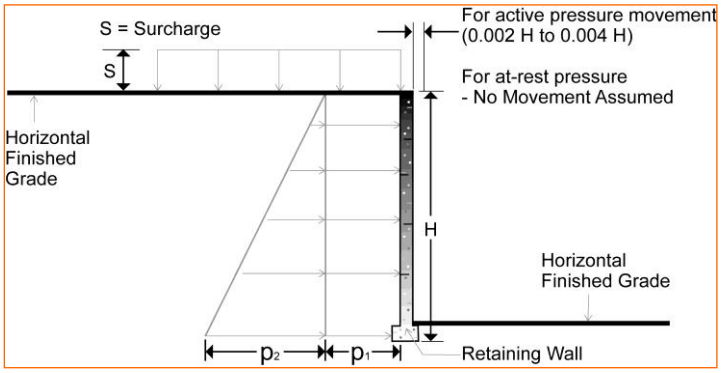
Saw-cut control joints should be placed in the slab to help control the location and extent of cracking. For additional recommendations refer to the ACI Design Manual. Joints or cracks should be sealed with a water-proof, non-extruding compressible compound specifically recommended for heavy duty concrete pavement and wet environments.

Where floor slabs are tied to perimeter walls or turn-down slabs to meet structural or other construction objectives, our experience indicates differential movement between the walls and slabs will likely be observed in adjacent slab expansion joints or floor slab cracks beyond the length of the structural dowels. The Structural Engineer should account for potential differential settlement through use of sufficient control joints, appropriate reinforcing or other means.

Mitigation measures, as noted in **Existing Fill** within the **Earthwork** section, are critical to the performance of floor slabs. In addition to the mitigation measures, the floor slab can be stiffened by adding steel reinforcement, grade beams and/or post-tensioned elements.

Floor Slab Construction Considerations

Finished subgrade, within and for at least 10 feet beyond the floor slab, should be protected from traffic, rutting, or other disturbance and maintained in a relatively moist condition until floor slabs are constructed. If the subgrade should become damaged or desiccated prior to construction of floor



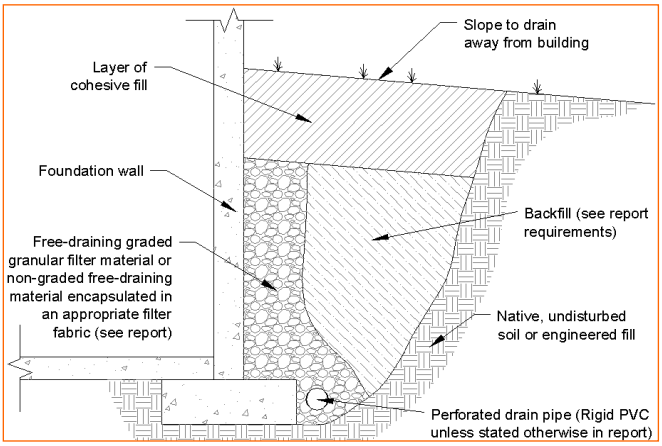
slabs, the affected material should be removed and structural fill should be added to replace the resulting excavation. Final conditioning of the finished subgrade should be performed immediately prior to placement of the floor slab support course.

The Geotechnical Engineer should approve the condition of the floor slab subgrades immediately prior to placement of the floor slab support course, reinforcing steel, and concrete. Attention should be paid to high traffic areas that were rutted and disturbed earlier, and to areas where backfilled trenches are located.

LATERAL EARTH PRESSURES

Design Parameters

Structures with unbalanced backfill levels on opposite sides should be designed for earth pressures at least equal to values indicated in the following table. Earth pressures will be influenced by structural design of the walls, conditions of wall restraint, methods of construction and/or compaction and the strength of the materials being restrained. Two wall restraint conditions are shown in the diagram below. Active earth pressure is commonly used for design of free-standing cantilever retaining walls and assumes wall movement. The “at-rest” condition assumes no wall movement and is commonly used for basement walls, loading dock walls, or other walls restrained at the top. The recommended design lateral earth pressures do not include a factor of safety and do not provide for possible hydrostatic pressure on the walls (unless stated).



Lateral Earth Pressure Design Parameters				
Earth Pressure Condition [1]	Coefficient for Select Fill Backfill [2]	Surcharge Pressure [3, 4, 5] p_1 (psf)	Effective Fluid Pressures (psf) [2, 4, 5]	
			Unsaturated [6]	Submerged [6]
Active (Ka)	0.31	(0.27)S	(35)H	0.27
At-Rest (Ko)	0.47	(0.43)S	(55)H	0.43
Passive (Kp)	3.25	---	(480)H	3.69

1. For active earth pressure, wall must rotate about base, with top lateral movements 0.002 H to 0.004 H, where H is wall height. For passive earth pressure, wall must move horizontally to mobilize resistance.
2. Uniform, horizontal backfill, compacted to at least 95% of the ASTM D 1557 maximum dry density, rendering a maximum unit weight of 120 pcf.
3. Uniform surcharge, where S is surcharge pressure.
4. Loading from heavy compaction equipment is not included.
5. No safety factor is included in these values.
6. To achieve “Unsaturated” conditions, follow guidelines in Subsurface Drainage for Below-Grade Walls section below. “Submerged” conditions are recommended when drainage behind walls is not incorporated into the design.

Backfill placed against structures should consist of granular soils or low plasticity cohesive soils. For the granular values to be valid, the granular backfill must extend out and up from the base of the wall at an angle of at least 45 and 60 degrees from vertical for the active and passive cases, respectively.

Subsurface Drainage for Below-Grade Walls

A perforated rigid plastic drain line installed behind the base of walls and extends below adjacent grade is recommended to prevent hydrostatic loading on the walls. The invert of a drain line around a below-grade building area or exterior retaining wall should be placed near foundation bearing level. The drain line should be sloped to provide positive gravity drainage to daylight or to a sump pit and pump. The drain line should be surrounded by clean, free-draining granular material having less than 5% passing the No. 200 sieve, such as No. 57 aggregate. The free-draining aggregate should be encapsulated in a filter fabric. The granular fill should extend to within 2 feet of final grade, where it should be capped with compacted cohesive fill to reduce infiltration of surface water into the drain system.

As an alternative to free-draining granular fill, a pre-fabricated drainage structure may be used. A pre-fabricated drainage structure is a plastic drainage core or mesh which is covered with filter fabric to prevent soil intrusion, and is fastened to the wall prior to placing backfill.

SOLDIER PILE WALLS

Based on the slope stability analyses and the proposed development plan, we recommend that the retaining wall along the east end of the proposed fill pad be supported on deep foundations consisting of a row of cast in place concrete piles. Based on our analyses, the piles should be spaced no more than 8 feet apart. The piles should be embedded a minimum of 5 feet into the basalt bedrock encountered at the site, and should be designed to retain the proposed structural fill (under the parking and drive lanes), and underlying native residual soils to the surface of the bedrock. Based on our explorations, the surface of the bedrock ranges from about 20 to 33 feet below site grades along the wall alignment. This depth will likely have more variation during construction to the variable thickness of the fill present at the site.

Lateral Earth Pressures

Based on slope stability analyses attached to this report, we recommend the piles be designed to retain the soils from the proposed finished grade to the surface of the basalt bedrock. The parameters defined in the table below should be utilized in the design of the drilled shafts to determine required embedment depth and spacing, taking into consideration a minimum spacing between piles of 8 feet along the top of the slope and a minimum embedment of 5 feet into the bedrock. Additional embedment into the bedrock may be necessary to provide adequate resistance to overturning.

The design of lateral earth stabilization piers is conventionally accomplished using empirical relationships and apparent earth pressure distributions. These earth pressure distributions or envelopes do not represent the precise distribution of earth pressures but rather constitute

hypothetical pressures from loads can be calculated which would not likely be exceeded in the event of a landslide.

Design of these systems could be based on either “active” or “at-rest” lateral earth pressures, depending on the degree of deformation that can be tolerated. Piers which are free to deform on the order of 0.001 to 0.002 times the height of the exposed potential height is considered to be capable of mobilizing active earth pressures. This lateral deformation is likely to be accomplished by vertical settlement of up to roughly 0.002 times the height of the piers, which may extend back from the side of the slide face a distance equal to roughly the height of the exposed height. A greater amount of lateral deformation could allow greater vertical settlements. Since there are structural elements within the zone considered to be at risk during a potential slide, we believe it is appropriate to design utilizing at-rest earth pressures.

An assumed “at-rest” earth pressure condition theoretically assumes no movement of the soil behind the stabilization piers; however, some settlement should realistically be anticipated due to construction practices and/or the fact that it is not possible to construct a perfectly stiff system and the space between the piers are reliant on soil arching for support should be piers be exposed.

Material	Equivalent Fluid Weight		Strength Parameters (Drained)	
	At Rest (pcf)	Allowable Passive (pcf)	Drained Cohesion (psf)	Drained Friction Angle (degrees)
Existing Fill	120	320	0	27
Proposed Fill	125	407	0	32
Residual Soil	125	375	250	30
Fresh Bedrock	150	874	500	45

In the table above, the at-rest pressures act on the pile spacing above the bedrock and on the pier diameter below that depth. The passive pressures act on twice the pier diameter. We recommend a minimum pier embedment of at least 5 feet into competent basalt bedrock.

Construction Considerations

If soldier piles are installed prior to removal of the existing debris-laden undocumented fill, caving conditions should be expected in the fill materials. Therefore, drilled shaft excavations may require the use of temporary casing and drilling fluid to maintain integrity of the excavation walls and bottom. Groundwater was not encountered within the anticipated depth of drilling, but isolated perched zones may be encountered within the residual soil or at the top of the underlying bedrock, particularly following periods of heavy rainfall. Thick drilling fluid and/or casing may be required to offset the groundwater and caving conditions. Following completion of the excavation and prior

to installing reinforcement or concrete the bottom of the shaft must be cleaned of any soft or loose material.

Caving of the sidewalls and/or heaving of the shaft bottoms may occur during wet weather conditions. We recommend that the contractor be prepared to use casing and/or slurry installation methods in the event that wall sloughing, caving, or heave occurs. The contractor should also be equipped to clean out the bottom of the shafts if loose soil is observed or suspected.

If less than 3 inches of water is present in the bottom of the excavation, groundwater seepage into the excavation is at a rate of no more than 12 inches per hour and the shaft diameter is greater than or equal to 3 feet; concrete may be placed by free-fall. Under free-fall placement, deposit concrete through the center of the reinforcement cage by a method which prevents segregation of aggregates and splashing of concrete on the reinforcement cage. Place concrete so that the free-fall is vertical down the center of the shaft without hitting the sides, the steel reinforcing bars or steel cage bracing.

If the drilled shaft does not meet the above requirements, we recommend placing concrete from the bottom of the holes with a tremie pipe to form a continuous column and prevent aggregate separation. Concrete should be placed with a higher than average slump into the excavation through a tremie pipe extending to the bottom of the excavation. An uninterrupted supply and placement of concrete should be performed to produce a monolithic pier. Use clean, watertight tremie pipes large enough in diameter to allow the free flow of concrete. The tremie pipes should be placed within one to two feet above the bottom of the excavation prior to the commencement of concrete placement. Maintain a minimum 5 feet embedment of the tremie pipe in the concrete during concrete placement.

The bottom of the shaft must be observed or tested to verify that all loose material has been removed and dense granular soil is exposed. The contractor should review the conditions encountered and reported on the boring logs and in this report and provide appropriate equipment to excavate the shafts to the design depths at this site.

Reinforcing steel and concrete should be placed inside the temporary casing. The casing should be pulled as the concrete is placed to provide final contact between the soil and the concrete. A minimum head of 5 feet of concrete should be maintained above the lower edge of the casing as it is pulled to prevent intrusion of soil during extraction.

PAVEMENTS

General Pavement Comments

Pavement designs are provided for the traffic conditions and pavement life conditions as noted in **Project Description** and in the following sections of this report. A critical aspect of pavement performance is site preparation. Pavement designs noted in this section must be applied to the site which has been prepared as recommended in the **Earthwork** section.

Pavement Design Parameters

Design of Asphaltic Concrete (AC) pavements are based on the procedures outlined in the American Association of State Highway and Transportation Officials (AASHTO), 1993. Design of Portland Cement Concrete (PCC) pavements are based upon American Concrete Institute (ACI) 330; Guide for Design and Construction of Concrete Parking Lots.

A subgrade CBR of 9 (from attached laboratory testing) was used for the AC pavement designs, and a modulus of subgrade reaction (k) of 100 pci was used for the PCC pavement designs where subgrade stabilization consisting of CAB or cement treated soil is employed. The values were empirically derived based upon our experience with the fine-grained subgrade soils and our understanding of the quality of the subgrade as prescribed by the **Site Preparation** conditions as outlined in **Earthwork**. A modulus of rupture of 580 psi was used for pavement concrete.

Pavement Section Thicknesses with Subgrade Stabilization

As a minimum, we suggest the following pavement section be considered:

Asphaltic Concrete Design		
Layer	Thickness (inches)	
	Light Duty [1]	Heavy Duty [1]
AC [2]	3	4
Aggregate Base [3]	7	8

1. See **Project Description** for more specifics regarding Light Duty and Medium Duty traffic.
2. All materials should meet the Oregon Department of Transportation (ODOT) Standard Specifications for Construction (2018).
   - Asphaltic Surface - ODOT Type A Asphaltic Cement Concrete: Section 00744
   - Asphaltic Base - ODOT Type B Asphaltic Cement Concrete, Class I: Section 00745
3. A minimum 1.5-inch surface course should be used on ACC pavements.

Portland Cement Concrete Design		
Layer	Thickness (inches)	
	Light Duty [1]	Heavy Duty [3]
PCC [2]	5	6
Aggregate Base [3]	7	8

1. See **Project Description** for more specifics regarding traffic classifications.
2. All materials should meet the current State Department of Transportation ODOT) Standard Specifications for Highway and Construction (2018).
   - Concrete Pavement - ODOT Portland Cement Concrete Type C: Section 00756
3. In areas of anticipated heavy traffic, fire trucks, delivery trucks, or concentrated loads (e.g. dumpster pads), and areas with repeated turning or maneuvering of heavy vehicles.

We understand that typical fire departments require that the proposed pavement sections at the site will support a fire emergency truck once the apartment complex is constructed. Typically, we estimate total fire-truck load of 80,000 pounds for a three axle (single tire) truck. Based on these assumptions and the proposed loading conditions, we computed the ultimate bearing capacity of the pavement sections relative to a 20 percent increase of the factored load of the fire truck. From a bearing failure standpoint, the Truck Loading Section pavements are estimated to be adequate for support of the fire truck vehicle (with a factor of safety of 2.5). Pavement areas may experience some localized cracking from these large fire truck vehicle loads but are not expected to experience bearing failure of the pavement section. Based on this analysis, it is our opinion that pavement will provide adequate support for the temporary use of an emergency fire truck at the site.

Pavement Drainage

Pavements should be sloped to provide rapid drainage of surface water. Water allowed to pond on or adjacent to the pavements could saturate the subgrade and contribute to premature pavement deterioration. In addition, the pavement subgrade should be graded to provide positive drainage within the granular base section. The subgrade and the pavement surface should have a minimum ¼ inch per foot slope to promote drainage. Appropriate sub-drainage or connection to a suitable daylight outlet should be provided to remove water from the base layer.

Pavement Maintenance

The pavement sections represent minimum recommended thicknesses and, as such, periodic maintenance should be anticipated. Therefore, preventive maintenance should be planned and provided for through an on-going pavement management program. Maintenance activities are intended to slow the rate of pavement deterioration and to preserve the pavement investment. Maintenance consists of both localized maintenance (e.g., crack and joint sealing and patching) and global maintenance (e.g., surface sealing). Preventive maintenance is usually the priority when implementing a pavement maintenance program. Additional engineering observation is

recommended to determine the type and extent of a cost-effective program. Even with periodic maintenance, some movements and related cracking may still occur and repairs may be required. Pavement performance is affected by its surroundings. In addition to providing preventive maintenance, the civil engineer should consider the following recommendations in the design and layout of pavements:

- Final grade adjacent to paved areas should slope down from the edges at a minimum 2%.
- Subgrade and pavement surfaces should have a minimum 2% slope to promote proper surface drainage.
- Install below pavement drainage systems surrounding areas anticipated for frequent wetting.
- Install joint sealant and seal cracks immediately.
- Seal all landscaped areas in or adjacent to pavements to reduce moisture migration to subgrade soils.
- Place compacted, low permeability backfill against the exterior side of curb and gutter.
- Place curb, gutter and/or sidewalk directly on clay subgrade soils rather than on unbound granular base course materials.

GENERAL COMMENTS

Our analysis and opinions are based upon our understanding of the project, the geotechnical conditions in the area, and the data obtained from our site exploration. Natural variations will occur between exploration point locations or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. Terracon should be retained as the Geotechnical Engineer, where noted in this report, to provide observation and testing services during pertinent construction phases. If variations appear, we can provide further evaluation and supplemental recommendations. If variations are noted in the absence of our observation and testing services on-site, we should be immediately notified so that we can provide evaluation and supplemental recommendations.

Our Scope of Services does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

Our services and any correspondence or collaboration through this system are intended for the sole benefit and exclusive use of our client for specific application to the project discussed and are accomplished in accordance with generally accepted geotechnical engineering practices with no third-party beneficiaries intended. Any third-party access to services or correspondence is solely for information purposes to support the services provided by Terracon to our client. Reliance upon the services and any work product is limited to our client, and is not intended for

third parties. Any use or reliance of the provided information by third parties is done solely at their own risk. No warranties, either express or implied, are intended or made.

Site characteristics as provided are for design purposes and not to estimate excavation cost. Any use of our report in that regard is done at the sole risk of the excavating cost estimator as there may be variations on the site that are not apparent in the data that could significantly impact excavation cost. Any parties charged with estimating excavation costs should seek their own site characterization for specific purposes to obtain the specific level of detail necessary for costing. Site safety, and cost estimating including, excavation support, and dewatering requirements/design are the responsibility of others. If changes in the nature, design, or location of the project are planned, our conclusions and recommendations shall not be considered valid unless we review the changes and either verify or modify our conclusions in writing.

Terracon Project No. 82125030

Dear Mr. Vanderdasson:

Terracon Consultants, Inc. (Terracon) is pleased to present our *Preliminary Engineering Geology and Soil Engineering Report* for the Proposed Retail Development project in Oregon City, Oregon. Our services were completed in general accordance with our *Proposal for Geotechnical Engineering Services – Revised* (P82110035R1), dated July 20, 2012. Email authorization to proceed with our services was provided by PACLAND on July 20, 2012. This report presents our preliminary conclusions regarding the stability of the slopes and soils from the proposed development.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report, or if we may be of further service, please contact us.

Sincerely,
Terracon Consultants, Inc.

APPENDIX A – EXHIBITS

Exhibit A-1	Site Plan
Exhibit A-2	Landslide Map Excerpt
Exhibit A-3	Preliminary Geologic Cross Section
Exhibit A-4	Preliminary Static Slope Stability
Exhibit A-5	Preliminary Seismic Slope Stability

EXECUTIVE SUMMARY

The site's geology and associated geologic hazards were researched with regard to the proposed site development. The preliminary engineering geology and geotechnical considerations associated with the proposed project are summarized below.

- **Existing, Adjacent Landslide Hazards:** The steep slope area to the east is a well-documented landslide hazard area. However, the area immediately adjacent to the site is mapped as an ancient landslide. Recent surface reconnaissance of the steep slope area does not indicate recent movement of the weathered landslide features.

- **Proposed Development Feasibility:** The proposed development is feasible from a geotechnical standpoint provided structures, significant fills, and other loads are located outside a suitable setback. Previous engineering studies established a setback of 35 feet from the top of slope and may be used for planning purposes of the new development.

- **Retaining Walls:** A retaining wall is proposed along the east side of the truck route at the currently proposed 35-foot top of slope setback. Additional engineering design will be necessary for the retaining wall, although our preliminary slope stability models indicate the walls are setback sufficiently from the top of the slope and should not adversely impact the stability of the slope.

- **Site Drainage and Erosion Control:** Surface water should be collected and routed away from the steep slope area. Infiltration facilities should not be implemented due to the potential for the infiltrated water to daylight on the adjacent steep slope areas and decrease slope stability. The area within the setback at the top of the slope may be cleared of invasive vegetation, such as blackberries, and suitably vegetated to reduce erosion towards the steep slope area.

This summary should be used in conjunction with the entire report for design purposes. It should be recognized that details were not included or fully developed in this section, and the report must be read in its entirety for a comprehensive understanding of the items contained herein. The **GENERAL COMMENTS** section should be read for an understanding of the report limitation.

PRELIMINARY ENGINEERING GEOLOGY AND SOIL ENGINEERING REPORT PROPOSED RETAIL DEVELOPMENT MOLALLA AVENUE AND BEAVERCREEK ROAD OREGON CITY, OREGON

Project No. 82125030
October 8, 2012

1.0 INTRODUCTION

In accordance with your request and written authorization, Terracon has completed a Preliminary Engineering Geology and Soil Engineering Evaluation for the proposed retail development in Oregon City, Oregon. Terracon, formerly Zipper Zeman Associates (ZZA), previously completed the following reports:

- Preliminary Results of Slope Stability Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon, by ZZA, dated July 3, 2002.
- Subsurface Exploration and Geotechnical Engineering Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon, by ZZA, dated February 13, 2004.

2.0 PURPOSE AND SCOPE

The purpose of this report is to satisfy the requirement for both a Preliminary Engineering Geology Report and a Preliminary Soil Engineering Report as required by the Oregon City Geologic Hazards Checklist. An updated geotechnical engineering report will be provided at a later date with engineering recommendations to be used for final design of the development.

Our scope of services included a slope reconnaissance, review of previous subsurface boring and test pit explorations, review of published geologic literature, preliminary geotechnical engineering analysis, and preparation of this report.

3.0 PROJECT INFORMATION

3.1 Site Location

ITEM	DESCRIPTION
Location	The site is located at the northeast corner of Molalla Avenue and Beavercreek Road in Oregon City, Oregon as shown in Exhibit A-1 – Site Plan.
Existing improvements	The site is currently vacant and fenced off. All former buildings have been razed, although several slab and foundations remain. Several retaining walls and/or slopes on the order of 4 feet or less in height are on the site.
Surroundings	The site is bounded by single and multi-family residences to the north, Molalla Avenue and commercial properties to the west, commercial properties to the south, and an undeveloped steep slope area dropping off to the east.
Current ground cover	The site is covered with grass, shrubs (blackberries, etc.), and scattered to dense stands of trees. The southeast portion of the site is wooded, and the entire south edge of the property is overgrown with dense blackberry shrubs.
Existing topography	The majority of the site is relatively flat with several low retaining walls creating broad terraces stepping down to the east. The eastern edge of the site drops steeply down at inclinations in the range of 1½H:1V to ½H:1V to the east toward Newell Creek. The overall slope system height is on the order of 200 feet in vertical drop. We understand that this steep slope area contains active and ancient landslide complexes and has been studied extensively by Portland State University geologists and other researchers.

3.2 Project Description

ITEM	DESCRIPTION
Structures	Main Retail Building The project will include a new one-story retail building and loading dock with a proposed total footprint of approximately 60,000 square feet (SF). The building footprint is planned in the northeast portion of the site as shown on the attached Site Plan. Outlots 1- 4 Four outlots are currently planned for the western third of the site for three retail buildings ranging from approximately 3,600 SF to 7,200 SF and a one- to two-story commercial/office building of approximately 23,000 SF. Outlot 2 will potentially include a remote drive-thru banking structure.
Building construction	Main Retail Building We have assumed that the store will be constructed with masonry block load-bearing and non-load-bearing walls; steel columns, girders, and joists for support of the roof structure; and on-grade cast-in-place floor slabs. Outlots 1-4 No information is available on the outlot buildings, but we assume they will be either wood-framed or masonry block construction with slab-on-grade floors.
Finished floor elevations	Main Retail Building: Currently planned at elevation 445 feet. Outlot 1: Currently planned at elevation 448 feet. Outlot 2: Currently planned at elevation 444 feet. Outlot 3: Currently planned at elevation 442 feet. Outlot 4: Currently planned at elevation 448 feet.
Maximum loads	Main Retail Building Columns: 85 kips gravity and 150 kips maximum live loading. Walls: 1.5 to 2 klf non-load bearing and 4 to 6 klf for load bearing. Slabs: 125 psf uniform loading and 5-kip concentrated loading max. Outlot Buildings The loads for these buildings are not known at this time, but are assumed to not exceed those listed above for the main retail building.

ITEM	DESCRIPTION
Maximum allowable settlement	Main Retail Building Total Static Settlement: 1 inch Masonry Walls: L/900 or ½ inch over 40 feet Outlots Total Static Settlement: 1 inch (assumed) Differential: L/900 or ½ inch over 40 feet (assumed)
Grading	Significant fills on the order of 10 to 12 feet in maximum thickness are expected on the east half of the site and in the building pad. Excavation cuts (or removal of stockpile areas) up to approximately 10 feet may be needed in the proposed truck route off the southeast corner of the site in the existing stockpile areas.
Cut and fill slopes	3H:1V slopes approximately 4 feet or less in height are expected.
Free-standing retaining walls	An approximately 626-foot long by 5- to 12-foot high retaining wall is planned along the east edge of the truck route outside the steep slope setback. Guards rails and/or fall protection fencing are anticipated atop the retaining walls. Determination of the wall type, e.g., segmental block, soldier pile, etc., has not yet been determined along the east side of the truck route but will be determined as part of the final design to include slope stability concerns.
Below Grade Areas	A loading dock area is planned on the northeast corner of the building with a finish grade of 4 feet below the finish floor elevation.
Stormwater Management	A buried detention structure is planned in the southeast corner of the site under the parking area. We understand that the depth of the structure is currently planned at approximately 7 feet below finish grade.
Off-site Improvements	A public road and truck route is proposed from the southeast corner of the site south to Beavercreek Road.
Buried Utilities	We understand that stormwater and water pipes will run along the truck route on the east side of the site. Depths are anticipated to be 10 feet or less. A sanitary sewer line is proposed to run east-west from Molalla between Outlot 2 and Outlot 3 to the main retail building. The sanitary sewer will also run north-south up the Outlot 2 parking lot north to Outlots 1 and 4. Depths have not been determined yet, but may exceed 10 feet in depth.

4.0 LITERATURE REVIEW

Per Oregon City Municipal Code 17.44.050, we reviewed the following documents for this report:

- The State of Oregon Department of Geology and Mineral Industries (DOGAMI) in Bulletin 99, Geology and Geological Hazards of North Clackamas County, Oregon (1979), or in any subsequent DOGAMI mapping for the Oregon City area;
- Portland State University study entitled “Environmental Assessment of Newell Creek Canyon, Oregon City, Oregon (1992);
- Portland State University study, "Landslides in the Portland, Oregon, Metropolitan Area Resulting from the Storm of February 1996: Inventory Map, Database and Evaluation" (Burns and others, 1998);
- DOGAMI Open File Report O-06-27, "Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from LIDAR Imagery and Aerial Photographs" (Madin and Burns, 2006);
- "Preliminary Geologic Map of the Oregon City Quadrangle, Clackamas County, Oregon" (Madin, in press).

We also reviewed the following, more recently published documents:

- Map showing faults, bedrock geology, and sediment thickness of west half of Oregon City 1:100,000 quad, Washington, Multnomah, Clackamas and Marion Counties, Oregon, 1998, IMS-4, Burns et al., (DOGAMI)
- *Oregon Geologic Data Standard v. 2.1,* 2009 (DOGAMI)
- *Geologic Map of the Oregon City 7.5’ Quadrangle, Clackamas County, Oregon*, 2009, GMS-119 (DOGAMI)
- *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs*, O-06-27, 2006 (DOGAMI)
- *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon*, IMS-26, 2009 (DOGAMI)

5.0 PRELIMINARY ENGINEERING GEOLOGY

According to Oregon City’s Geologic Hazards Checklist, a preliminary engineering geology report must be prepared that relates the following items to the actual development proposal:

- (5.1) A description of geologic formations, bedrock and surficial materials including artificial fill; location of any faults, folds, etc.
- (5.2) Structural data including bedding, jointing, and shear zones

- (5.3) Off-site geologic conditions that may pose a hazard to the site or that may be affected by on-site development
- (5.4) Cross sections showing subsurface structure, logs of subsurface explorations and analysis if necessary to evaluate the site
- (5.5) Signature and certification number of the engineering geologist
- (5.6) The report shall also contain a statement as to whether any hazard areas should not be disturbed because of the potential for damage to the site or neighboring properties
- (5.7) The report shall include specific comments resulting from their review of the civil plans for the project including recommendations on maximum cuts, structural fills, rockery walls, drainage behind any type of walls, maximum slopes above walls, removal of toe of slopes, the use of rock hammers and blasting, and so forth.

The above items are discussed individually in the following sections.

5.1 Geologic Description

Geologically, the site is located in the northern Willamette Valley, which consists of a structural trough between the Coastal Range and the Cascade Range. This basin is underlain by thick deposits of sand and gravel washed into it during the Pliocene epoch when the climate in the area was very dry. These granular deposits are locally covered by the Boring lavas (Qtb) in northwest Clackamas County.

Based on the *Oregon Geologic Data Standard v. 2.1* and Oregon Department of Geology and Mineral Industries *Geologic Map of the Oregon City 7.5' Quadrangle, Clackamas County, Oregon, 2009* this site is located within a geologic unit mapped as Tbc-Basalt of Canemah defined as flow or flows of grey medium-grained, olivine basalt. The Oregon Department of Geology and Mineral Industries (DOGAMI), Bulletin 99, *Geologic Map of the Canby and Oregon City Quadrangles, Oregon 1979*, maps the site as consisting of Boring lavas (Qtb), which it describes as Pliocene-Pleistocene lavas, light-gray, open-textured olivine basalt; flow structures common; includes some pyroclastic material of local extent; widely spaced joint pattern. Lavas and breccias have weathered to a residual red clay surface soil. Vertical exposures are susceptible to mass movement and deep bedrock sliding because of failure of underlying material (see the description below with clay materials within the Troutdale unit).

The Boring Lava deposits overly the Troutdale (Tpt), which are described as Pliocene sandstone and conglomerate; indurated beds and lenses of well-sorted sand and cobbly gravel with up to 30 percent quartzite clasts. Some sand originally composed of volcanic glass have altered to an impermeable high shrink-swell clay. The clay can be unstable and cause overlying competent units to fail by landslide. The publications indicate that on slopes where this clay layer daylights, one generally encounters a spring. Also, if layers dip out of the slope, it can become a failure

plane for a slump or slump-earthflow when the pore water pressure has built up to a critical value on top of the clay layer.

Based on the *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs, O-06-27, 2006* and the *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon, IMS-26, 2009,* a mapped landslide was identified adjacent to the site to the east. The landslide is identified as a prehistoric or ancient landslide (movement greater than 150 years ago). This is defined by landslide features that are slightly eroded and there is no evidence of historic (recent in last 150 years) movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

The borings completed for the previously referenced 2004 ZZA report are generally consistent with the above geologic mapping for the Boring Lavas/Basalt of Canemah, although the basalt has become deeply weathered in certain areas. The Troutdale unit was not encountered to the maximum depth of the borings at approximately 50½ feet below the ground surface. Although direct evidence of landslide features were not readily observed during our exploration programs for the 2004 report, we did observe the general headscarp area of the ancient landslide area during our 2012 slope reconnaissance with the aid of the recent Lidar-based landslide maps. An excerpt of the landslide map is appended as Exhibit A-2.

5.2 Structural Data

Bedrock outcrops or exposures were not observed during our site visits on the subject property or immediately downslope of the subject property. As discussed above, the bedrock in the site vicinity is mapped as Tbc-Basalt of Canemah defined as flow or flows of grey medium-grained, open-textured, olivine basalt. Flow structures are common, includes some pyroclastic material of local extent, and widely spaced joint pattern. Lavas and breccias have weathered to residual red clay surface soil. Vertical exposures are susceptible to mass movement and deep bedrock sliding because of failure of underlying material. The rock cores completed for the previously referenced 2004 ZZA report indicate close fracture spacing in the upper, weathered zones of the bedrock grading to wide fracture spacing in the fresh, competent bedrock at depth.

5.3 Off-Site Geologic Conditions

The *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs, O-06-27, 2006* and the *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon, IMS-26, 2009,* indicate a mapped landslide area adjacent to the east side of the site. The landslide is identified as a prehistoric or ancient landslide (movement greater than 150 years ago). This is defined by landslide features that are slightly eroded and there is no evidence of historic (recent in last 150

years) movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

During our initial exploration period during 2001-2002, we performed a surface reconnaissance of the steep slope area on the eastern edge of the site and immediately downslope of the site to the east. We also re-visited these areas on July 31, 2012 to determine the current conditions. During our slope reconnaissance visits, we walked and mapped the landslide area. We identified a main head scarp along the eastern site boundary, followed by numerous (3 to 5) internal scarps further east of the site within the ancient mapped landslide itself. A spring was observed at the base of the head scarp approximately 100 feet east of the northeast corner of the site at approximately 350 feet in elevation. A second spring was observed approximately 150 feet east of the southeast corner of the site at approximately 290 feet in elevation. Four nick points (i.e., drops in the streambed from erosion) were observed in the stream bed at the base of the ancient landslide ranging in height from 1½ feet to 6 feet. Gray, stiff to medium stiff, wet, lean clay with cemented clasts of gray clay was observed at various points along the stream bed. These deposits can be correlated to the fine grained portion of the Troutdale formation described above. At the time of our site reconnaissance Terracon did not identify new slide areas immediately downslope of the proposed development.

Our field observations agree with the above-referenced published landslide mapping. We did not observe indications of recent movement during our slope reconnaissance during the 2001-2002 ZZA exploration programs and our recent site visit in July 2012.

5.4 Geologic Cross-Sections

Our interpretation of the site's geologic cross-section is shown in Exhibit A-3 of this report.

5.5 Signature and Certification Number of Engineering Geologist

The signature and certification number of the engineering geologist is provided on the report signature page after the front cover.

5.6 Disturbance of Hazards Statement

The geologic hazards of concern for the site development are the steep slope area and ancient landslide to the east of the site. This geologic hazard area should not be disturbed due to the potential for damage to the site and/or neighboring properties. An exception for disturbance would be the removal of invasive vegetation, such as blackberry bushes, and replanting with species suitable for erosion control purposes. After removal of the invasive vegetation, minor grading may necessary, such as bucket smoothing and track walking the slope with a tracked

excavator, to reduce erosion and help temporary and permanent ground cover (e.g., hydroseed, mulch, bark, plantings, etc.) become established on the slope.

5.7 Civil Plans Review Comments

We have reviewed the current civil grading plans. The current site development plans are described in the Section 3 of this report and do not propose to disturb the geologic hazard area. These plans were developed using the 2004 ZZA report recommendations as a guideline. According to these plans, the maximum permanent cuts are relatively low, on the order of 2 to 3 feet for the retaining walls along the north property line. Fills will be up to approximately 12 feet along the east retaining wall area for the proposed truck route, but this wall will be located outside of a top of slope setback of 35 feet. The retaining walls, drainage behind the walls, and maximum slopes above and below the walls will be engineered as part of future design work for the site, and will consider the weight of the fill and loads on the retaining structure on the stability of the slope area. Consideration of the wall type, bedrock conditions, and associated installation procedures will also be included in the retaining wall design. In our opinion, the proposed site development is feasible from a geotechnical perspective without adverse impacts on the stability to the adjacent slope.

6.0 PRELIMINARY SOIL ENGINEERING REPORT

According to Oregon City's Geologic Hazards Checklist, a preliminary soil engineering report must be prepared that relates the following items to the actual development proposal:

- (6.1) The engineering feasibility of the proposed development and addressing strength properties of surface and subsurface soils with regard to stability of slopes
- (6.2) Appropriate types of foundations together with bearing values and settlement criteria for foundation design, soil erosion potential, permeability and infiltration rates
- (6.3) Excavation, filling and grading criteria including recommended final slopes
- (6.4) Surface and subsurface drainage; planting and maintenance of slopes
- (6.5) Other identified soil or subsurface constraints together with geotechnical remediation and other recommendations to alleviate or minimize their effects; and signature and seal of the geotechnical engineer
- (6.6) The report shall also contain a statement as to whether the proposed development, constructed in accordance with the recommended methods, is reasonably likely to be safe and prevent landslide or other damage to other properties over the long term, and whether any specific areas should not be disturbed by construction.

- (6.7) The report shall include specific comments resulting from their review of the civil plans for the project including recommendations on maximum cuts, structural fills, rockery walls, drainage behind any type of walls, maximum slopes above walls, removal of toe of slopes, the use of rock hammers and blasting, and so forth.

The above items are discussed individually in the following sections.

6.1 Engineering Feasibility

In our opinion, the proposed site development is feasible from a geotechnical perspective. Exhibits A-4 and A-5 show our preliminary slope stability models for static and seismic conditions, respectively. The following soil parameters were used in our analysis.

STRATA	FRICTION ANGLE (DEGREES)	COHESION (PSF)	UNIT WEIGHT (PCF)
Proposed Structural Fill	32	0	125
Existing Fill: Silt w/Debris	27	0	120
Highly – Moderately Weathered Basalt	30	250	125
Slightly Weathered to Fresh Basalt	45	250	150
Possible Slide Material	5	100	120

These parameters were partly based on the direct shear test results reported in the 2004 ZZA report and partly based on our engineering judgment. A horizontal seismic coefficient of 0.13g was used in our analysis, which is approximately one-half of the design earthquake peak ground acceleration determined per 2009 IBC methods. The models indicate factors of safety greater than 1.5 and 1.1 for static and seismic conditions, respectively. Based on the slope stability model, the proposed retaining wall and fill are far enough away from the slope and have low effect on the slope stability at the site from a preliminary standpoint.

6.2 Foundation Types, Soil Erosion Potential, Permeability/Infiltration

The appropriate type of foundation for the proposed buildings are conventional shallow spread footings. Allowable bearing values of 2,000 psf for up to 1 inch of settlement may be used for planning purposes.

According to the USDA Soil Conservation Service, the erosion potential of the site soils are "slight" on the relatively flat areas of the site and "severe" on the steep slope areas east of the site. Permeability ranges from 0.6 to 2.0 in the sites soils, however, infiltration systems are not recommended due to the location of the site adjacent the steep slope area.

6.3 Excavation, Filling, and Grading Criteria

Recommendations for excavation, filling and grading are included in the 2004 ZZA report and may be used for preliminary purposes. This information will be updated in the final geotechnical report.

6.4 Other Soil or Subsurface Constraints

Due to the previous development at the site, including existing foundations and floor slabs, existing fill will likely be encountered during subgrade preparation for fills and foundations. Within the proposed building pad, we recommend that all existing fill be removed down to suitable native soils, and the backfilled with compacted structural fill as recommended in the previous section and the 2004 report. Overexcavation of the existing fill soils will also likely be necessary in the retaining wall area along the east retaining wall (truck route). Alternatives, such as partial overexcavation and replacement or the use of aggregate pier ground improvement, should be considered during the final geotechnical report phase.

6.5 Proposed Development Stability Statement

In our opinion, the proposed development should not adversely affect the stability of the slope nor increase landslide risk to other properties with the incorporation of the 35-foot development setback. Additional fill or loads should not be placed over the unstable steep slope areas. The preliminary setback from the top of slope is currently 35 feet, but this may change on examination of new data and analysis from upcoming exploration and testing. It should be noted that there are documented, existing, ancient and recent landslides further downslope of the property that may continue to move but will not be adversely impacted by the subject site development. One benefit to the site development will actually be control of surface water, which currently is not being controlled above the steep slope area.

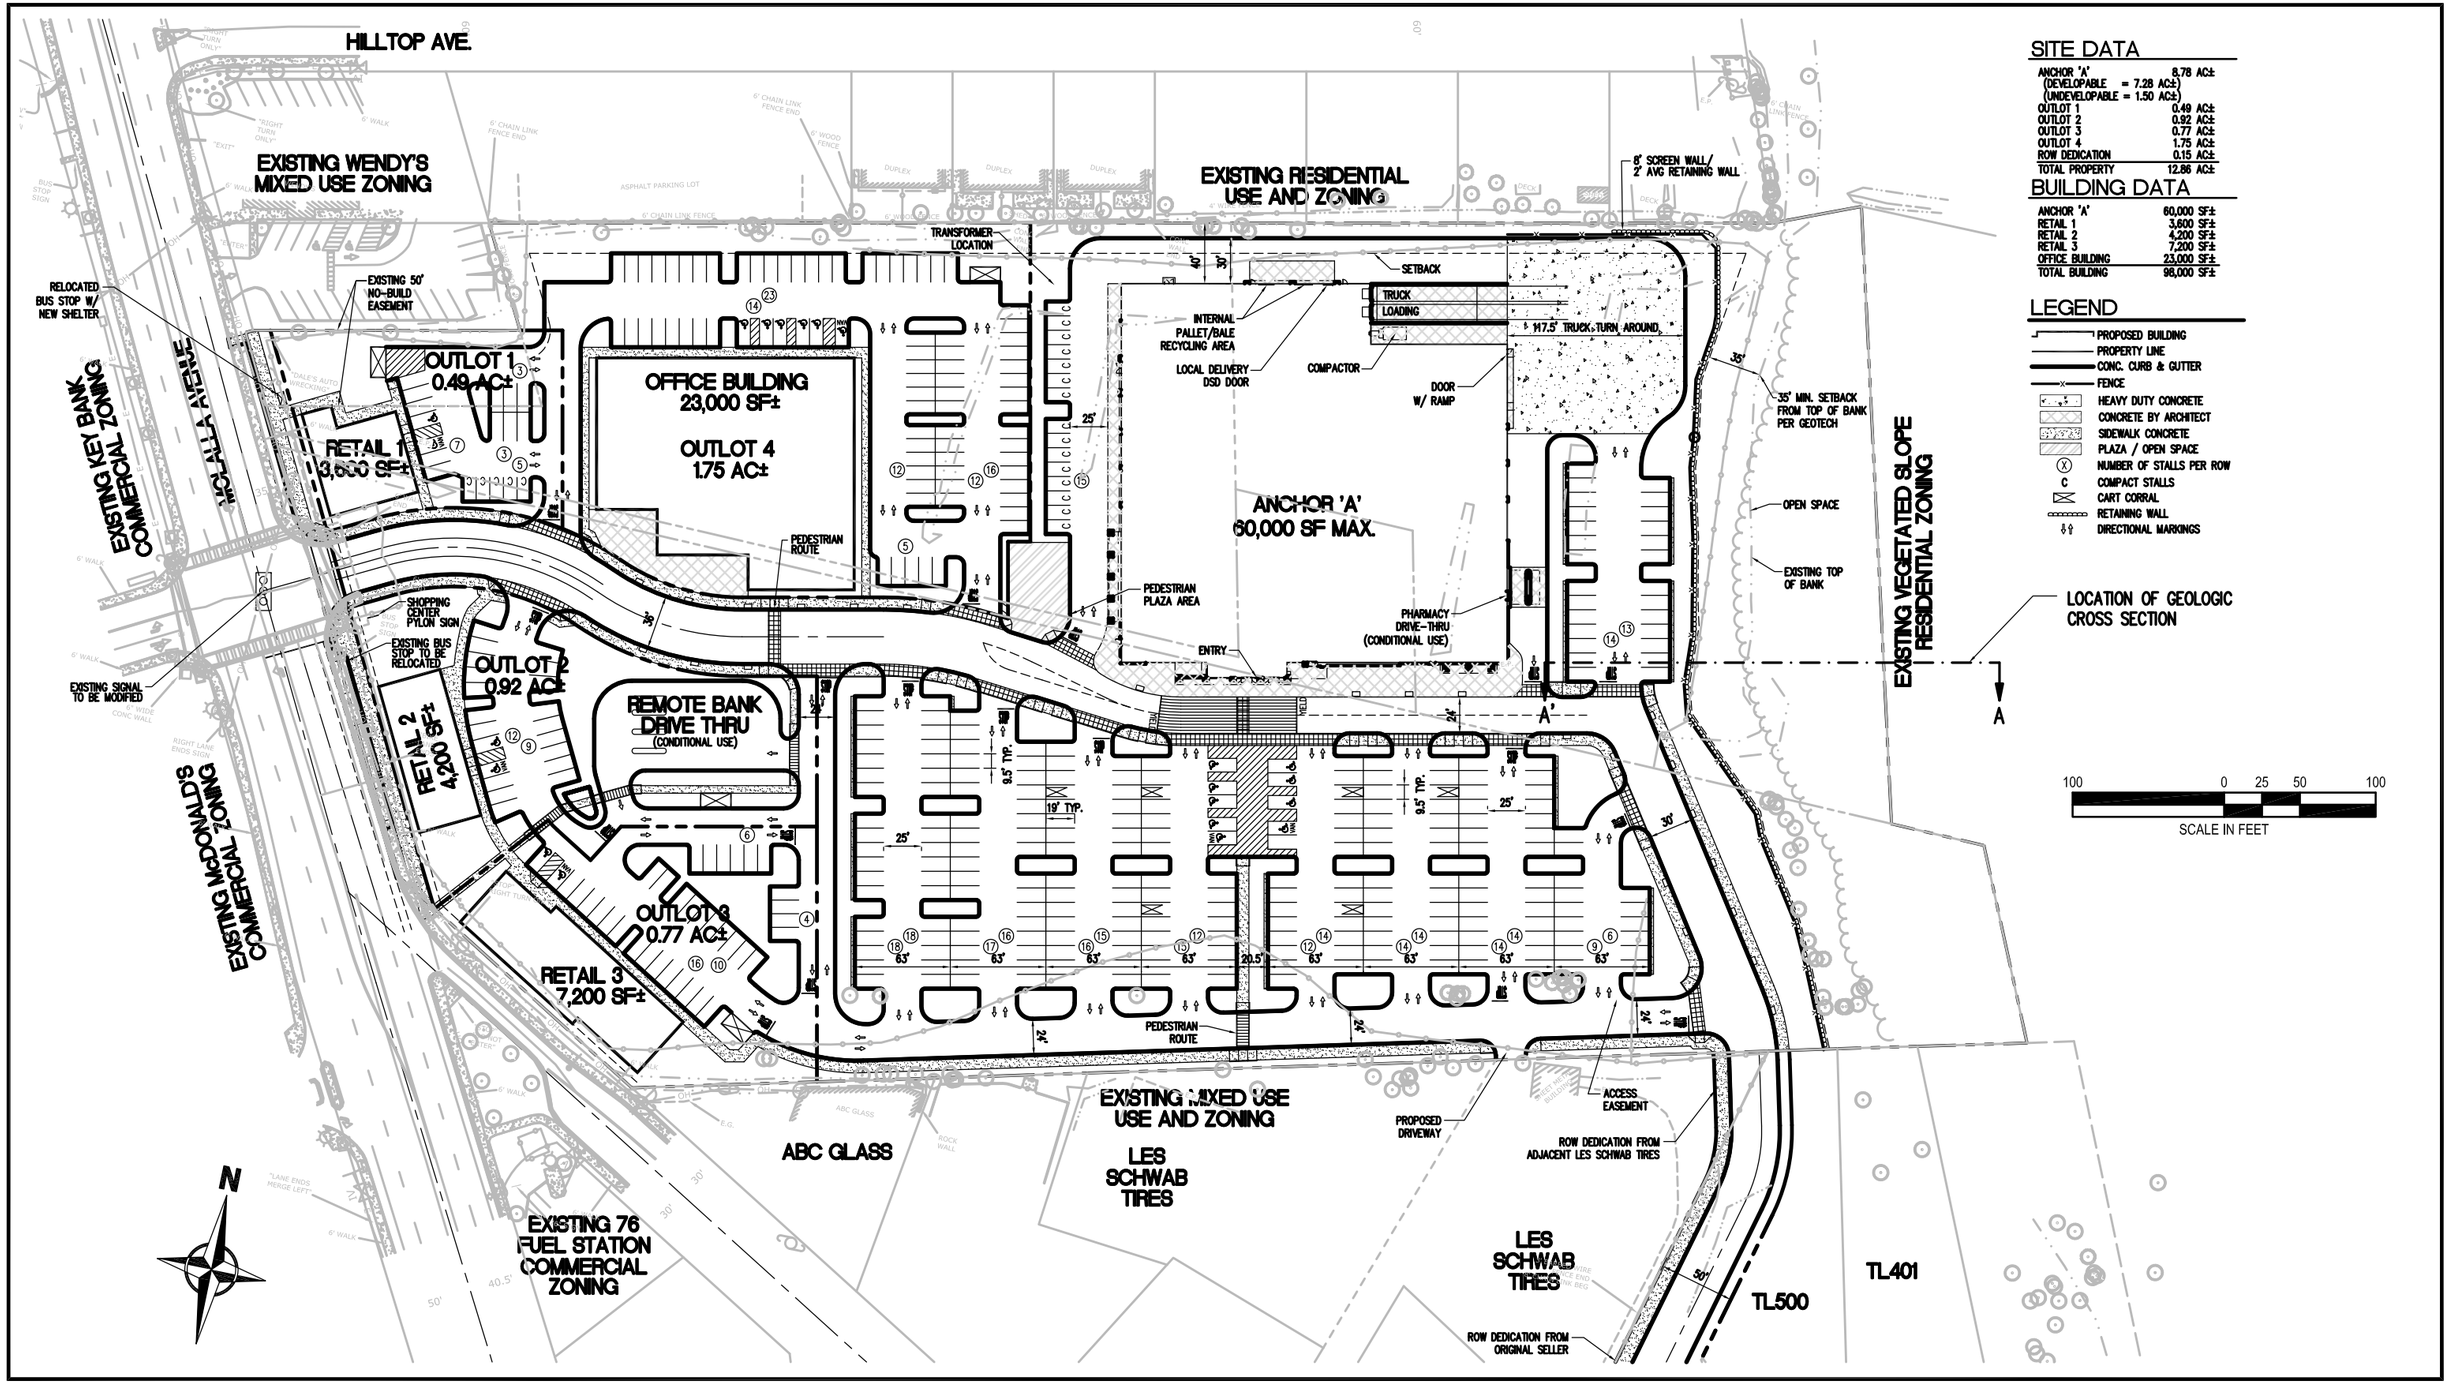
6.6 Civil Plans Review Comments

We have reviewed the current civil grading plans. The current site development plans are described in the Section 3 of this report and do not propose to disturb the geologic hazard area. These plans were developed using the 2004 ZZA report recommendations as a guideline. The maximum permanent cuts are relatively low, on the order of 2 to 3 feet for the retaining walls along the north property line. Fills will be up to approximately 12 feet along the east retaining

wall area for the proposed truck route, but this wall will be located outside of a top of slope setback of 35 feet. The retaining walls, drainage behind the walls, and maximum slopes above and below the walls will be engineered as part of future design work for the site, and will consider the weight of the fill and loads on the retaining structure on the stability of the slope area. Consideration of the wall type, bedrock conditions, and associated installation procedures will also be included in the retaining wall design. In our opinion, the proposed site development is feasible from a geotechnical perspective without adversely impacted the stability of the slope to the east.

7.0 GENERAL COMMENTS

Terracon should be retained to review the final design plans and specifications so comments can be made regarding interpretation and implementation of our geotechnical recommendations in the design and specifications. Terracon also should be retained to provide observation and testing services during grading, excavation, foundation construction and other earth-related construction phases of the project.



The analysis and recommendations presented in this report are based upon the data obtained from the borings performed at the indicated locations and from other information discussed in this report. This report does not reflect variations that may occur between borings, across the site, or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. If variations appear, we should be immediately notified so that further evaluation and supplemental recommendations can be provided.

The scope of services for this project does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

This report has been prepared in accordance with generally accepted geotechnical engineering practices for the exclusive use of PACLAND, and their respective successors and assigns, for specific application to the project location and stated purpose. No warranties, either express or implied, are intended or made. Site safety, excavation support, and dewatering requirements are the responsibility of others. In the event that changes in the nature, design, or location of the project as outlined in this report are planned, the conclusions and recommendations contained in this report shall not be considered valid unless Terracon reviews the changes and either verifies or modifies the conclusions of this report in writing.

LANDSLIDE ACTIVITY: Each landslide has been classified according to the relative age of last movement. This map display uses color to show the activity.

HISTORIC and/or ACTIVE (movement less than 150 years ago): The landslide appears to have moved within historic time or is currently moving (active).

PREHISTORIC or ANCIENT (movement greater than 150 years ago): Landslide features are slightly eroded and there is no evidence of historic movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

2021 Exploration

Exploration Number	Exploration Type	Exploration Depth (feet)	Location	
			Latitude	Longitude
21-B-1	Drilled Boring	90½	45.3363°N	122.5863°W

Exploration Layout and Elevations: Terracon personnel provided the exploration layout. Coordinates were obtained with a handheld GPS unit (estimated horizontal accuracy of about ±10 feet) and approximate elevations were obtained from Google Earth Pro data. If elevations and a more precise exploration layout are desired, we recommend explorations be surveyed following completion of fieldwork.

Subsurface Exploration Procedures: We advance soil borings with a truck-mounted drill rig using continuous flight augers (hollow stem or solid stem). Four samples were typically obtained in the upper 10 feet of each boring and at intervals of 5 feet thereafter. Soil sampling was performed using thin-wall tube and/or split-barrel sampling procedures. In the thin-walled tube sampling procedure, a thin-walled, seamless steel tube with a sharp cutting edge is pushed hydraulically into the soil to obtain a relatively undisturbed sample. In the split barrel sampling procedure, a standard 2-inch outer diameter split barrel sampling spoon is driven into the ground by a 140-pound automatic hammer falling a distance of 30 inches. The number of blows required to advance the sampling spoon the last 12 inches of a normal 18-inch penetration is recorded as the Standard Penetration Test (SPT) resistance value. The SPT resistance values, also referred to as N-values, are indicated on the boring logs at the test depths. The samples were placed in appropriate containers, taken to our soil laboratory for testing, and classified by a geotechnical engineer. In addition, we observed and recorded groundwater levels during drilling and sampling.

All explorations were supervised and logged by a field geologist who recorded field test data, classified soils, and collected the samples from the explorations. Our exploration team prepared field boring logs as part of standard drilling operations including sampling depths, penetration distances, and other relevant sampling information. Field logs include visual classifications of materials encountered during drilling, and our interpretation of subsurface conditions between samples. Final boring logs, prepared from field logs, represent the geotechnical engineer's interpretation, and include modifications based on observations and laboratory tests.

Upon encountering bedrock or refusal-to-drilling conditions, rock coring (using NQ/NX rock core barrel) was performed within select borings.

All explorations were supervised and logged by a field engineer or field geologist who recorded field test data, classified soils, and collected the samples from the explorations. Our exploration team prepared field boring logs as part of standard drilling operations including sampling depths, penetration distances, and other relevant sampling information. Field logs include visual classifications of materials encountered during drilling, and our interpretation of subsurface conditions between samples. Final boring logs, prepared from field logs, represent the geotechnical engineer's interpretation, and include modifications based on observations and laboratory tests.

Vibrating Wire Piezometer: We installed one vibrating wire piezometer (VWP) in boring 21-B-1 on December 17, 2021. The VWP was installed at a depth of approximately 30¾ feet below the ground surface (bgs), at the top of the intact, very low permeability, Boring lava (basaltic bedrock). This depth was determined by the project geotechnical engineer following completion of drilling. Prior to installation, the lower portion of the boring was filled with a bentonite chip-grout mixture and low-permeability grout was extended from approximately 35 feet bgs to about 1-foot bgs.

During installation, the VWP was taped to a one-inch diameter PVC pipe with the pressure sensor facing upwards. The VWP cable was taped to the PVC pipe on approximate 3-foot intervals as it was lowered into the boring. Once the VWP was at the target depth, a bentonite chip-grout mixture was placed from the bottom of the exploration to a depth of approximately 35 feet bgs. Then a low permeability grout was introduced to seal the upper portion of the exploration and allow the mini data logger to record changes in the vibrating wire frequency, and thus changes in pressure. The VWP wire was connected to a mini data logger housed within a steel, flush-mount wellhead. The mini data logger was set to record vibrating wire readings every 4 hours, starting December 20, 2021 at 5:00PM. Completion of the VWP is summarized in the following table:

Depth (feet bgs)	Description	Detail
0	Steel, flush-mount wellhead	Approximate 8-inch diameter and 18-inches tall
0 to 1	Void (open space)	---
1 to 35	Low permeability grout	50 PSI Grout for Medium to Hard Soils 30 gallon Water / 94 lb. Portland Cement
30¾	VWP piezometer installation	Geokon 4500S-350KPA (51psi)
35 to 90½	Bentonite chip-low permeability grout mixture	50 PSI Grout for Medium to Hard Soils 30 gallon Water / 94 lb. Portland Cement / 25 lb. Bentonite

Property Disturbance: We backfilled borings according to local jurisdiction requirements after completion of each exploration. Our services do not include repair of the site beyond backfilling our boreholes. Excess auger cuttings were dispersed in the general vicinity of each borehole. Since backfill material often settles below the surface after a period, we recommend boreholes be checked periodically and additional backfill added, if necessary.

Laboratory Testing

The project engineer reviewed the field data and assigned laboratory tests to understand the engineering properties of the various soil strata, as necessary, for this project. The following tests were performed for this project.

- ASTM D2216 Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
- ASTM D6913 Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis
- AASHTO T-267 Standard Method of Test for Determination of Organic Content in Soils by Loss on Ignition
- ASTM D1883 Standard Test Method for California Bearing Ratio (CBR) of Laboratory-Compacted Soils
- ASTM D6913 Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis
- ASTM D1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort
- ASTM G51 Standard Test Method for Measuring pH of Soil for Use in Corrosion Testing
- ASTM C 1580 Standard Test Method for Water-Soluble Sulfate in Soil
- ASTM G187 Standard Test Method for Measurement of Soil Resistivity Using the Two-Electrode Soil Box Method
- ASTM D2938 Standard Test Method for Unconfined Compressive Strength of Intact Rock Core Specimens
- ASTM D3080 Standard Test Method for Direct Shear Test Of Soils Under Consolidated Drained Conditions

The laboratory testing program included examination of soil samples by an engineer. Based on the material's texture and plasticity, we described and classified the soil samples in accordance with the Unified Soil Classification System.

Rock classification was conducted using locally accepted practices for engineering purposes; petrographic analysis may reveal other rock types. Rock core samples typically provide an improved specimen for this classification. Boring log rock classification was determined using the Description of Rock Properties.

	Date Drilled: 10/31/01	Logged By: MJB

Test Pit TP-1
Approximate ground surface elevation: 425 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Duff over soft, damp, brown, SILT with trace fine sand. (Topsoil) Sparse fine roots to 1.2 feet and sparse medium roots to 2 feet.	S-1@0.5' MC=24%
1.0-3.0	Soft grading to stiff, damp, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles.	S-2@2' MC=16%
3.0-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown sandy silt with trace clay.	
	Test pit completed at 10.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-2
Approximate ground surface elevation: 435 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Duff over soft, damp to moist, dark brown, SILT with trace fine sand and occasional fine gravel. (Topsoil) Sparse fine roots to one foot and sparse medium to large roots to 2 ½ feet. Pocket penetrometer at 0.5 feet = 1.75 tons per square foot (tsf.)	
0.8-3.0	Soft grading to stiff, damp, orange-brown, SILT with trace clay, fine sand, and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders. Pocket penetrometer at 1.5 feet > 4.5 tsf.	S-1@1.5'
3.0-7.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown silt with trace clay to silty SAND. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2@3.5' MC=31%
	Digging refusal at 7.0 feet on a boulder on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-3
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Duff over soft, moist to wet, dark brown, SILT with trace fine sand and occasional gray, moderately weathered, round, basaltic andesite boulders. (Topsoil) Sparse fine to medium roots to 1.2 feet.	S-1@0.5' S-2@1.0' MC=41%
1.0-2.5	Soft grading to stiff, damp to moist, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 2.75 tsf.	S-3@2.0' MC=25%
2.5-11.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown sandy silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-4@10.5' MC=44%
	Test pit terminated at 11.5 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-4
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.3	Duff over soft, damp to moist, dark brown, SILT with trace fine sand (Topsoil.) Moderate to dense fine roots to 1.2 feet and sparse medium roots to 1.2 feet.	S-1@1.0' MC=36%
1.3-3.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.5 feet = 1.5 tsf.	S-2@2.5' MC=24%
3.0-11.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay.	S-3@6.0' MC=53%
	Test pit terminated at 11.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-5
Approximate ground surface elevation: 441 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Duff over soft, moist to wet, dark brown, SILT with trace fine sand (Topsoil) Moderate to dense fine roots to 1.0 feet and sparse medium roots to 1.2 feet.	S-1@0.5’
0.7-3.5	Medium stiff, damp to moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 3 feet > 4.5 tsf.	
3.5-7.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown sandy silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite boulders.	S-2@7.0’
	Test pit terminated at 7.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-6
Approximate ground surface elevation: 442 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Duff over soft, moist, dark brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine roots to 0.8 feet and sparse medium roots to 1.2 feet.	
0.7-3.5	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 3 feet = 2.0 to 2.5 tsf.	S-1@1.0’ S-2 @3.0’
3.5-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-3@5.5’
	Test pit terminated at 10.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-7
Approximate ground surface elevation: 443 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Short to medium length grass and blackberry vines over soft, moist to wet, dark brown, SILT with trace fine sand and occasional pockets of 3/8" minus crushed rock (Topsoil/FILL) Moderate to dense fine roots to medium roots to 1.2 feet.	S-1@0.5' MC=30%
1.0-3.5	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 3.75 tsf.	S-2@2.0' MC=21%
3.5-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional dark gray, subangular, slightly weathered, basalt with visible vesicles.	S-3@10.0' MC=56%
	Test pit terminated at 10.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-8
Approximate ground surface elevation: 443 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.2	Grass over soft, moist to wet, dark brown, sandy, gravelly SILT (Topsoil/FILL) Dense fine roots to 1.0 feet.	S-1@1.0'
1.2-4.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite boulders. Pocket penetrometer at 3.0 feet > 4.5 tsf.	
4.0-11.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2@10.5'
	Test pit terminated at 11.0 feet on 11/1/01. Slight groundwater seepage observed at 11.0 feet. No caving observed.	

Test Pit TP-9
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Short grass and blackberry vines over soft, moist to wet, brown, gravelly SILT with trace fine sand. (Topsoil/FILL) Moderate to dense fine to medium roots to 1.0 feet.	S-1@0.5’
0.7-6.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
6.0-10.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	
	Test pit terminated at 10.5 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-10
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines over soft, moist to wet, brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine to medium roots to 1.2 feet.	S-1@1.0’ MC=28%
1.0-3.0	Soft grading to stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
3.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-2@5.0’ MC=20%
	Test pit terminated at 11.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-11
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines over soft, moist to wet, dark brown, SILT with occasional gravel. (Topsoil) Moderate to dense fine to medium roots to 1.8 feet.	S-1@0.5 MC=32%
1.0-3.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@2.0' MC=29% S-3@5.0' MC=44%
3.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders. Test pit terminated at 11.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	S-4@9.0' MC=59%

Test Pit TP-12
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Short grass and blackberry vines over soft, moist to wet, brown, gravelly SILT with trace fine sand. (Topsoil/FILL) Moderate fine to medium roots to 0.9 feet.	S-1@1.0'
1.5-3.5	Soft grading to stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 1.75 tsf. Pocket penetrometer at 3.0 feet > 4.5 tsf.	
3.5-9.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders. Test pit terminated at 9.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-13
Approximate ground surface elevation: 445 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.5	Short grass and blackberry vines over soft, wet, brown, SILT with trace to some sand. (Topsoil) Moderate fine to medium roots to 1.5 feet.	S-1@0.3' MC=24%
0.5-3.0	Medium stiff grading to stiff, moist to wet, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@2.0'
3.0-6.0	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	
	Test pit terminated at 6.0 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-14
Approximate ground surface elevation: 447 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.5	Short grass and blackberry vines over soft, wet, brown, SILT with trace to some sand. (Topsoil) Moderate fine roots to 1.0 feet.	S-1@0.3'
0.5-4.0	Medium stiff to stiff, moist to wet, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@3.0'
4.0-5.5	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 5.5 feet on 11/2/01 due to equipment failure. No groundwater seepage observed. No caving observed.	

Test Pit TP-15
Approximate ground surface elevation: 447 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Grass over soft, damp to moist, brown, SILT with SILT and occasional gravel. (Topsoil) Moderate fine roots to 2.0 feet.	S-1@1.0' MC=27%
1.5-7.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
7.0-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown sandy silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2@9.0' MC=59%
	Test pit terminated at 10.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-16
Approximate ground surface elevation: 446 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine roots to 1.0 feet.	S-1@0.5'
1.0-4.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
4.0-7.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown sandy silt with trace clay.	S-2@6.0'
7.0-10.0	Medium dense to very dense, dark gray, moderately weathered, subangular to rounded, poorly sorted, vesicular basalt clasts in a matrix of medium stiff to stiff, damp, red silt with trace clay.	
	Test pit terminated at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-17
Approximate ground surface elevation: 447 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.7	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine roots to 1.0 feet.	S-1@0.5' MC=26% S-2@1.0' MC=26%
1.7-3.0	Medium stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-3@2.5' MC=21%
3.0-7.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-4@5.5' MC=26%
7.0-10.5	Medium dense to very dense, dark gray, moderately weathered, subangular to rounded, poorly sorted, vesicular basalt clasts in a matrix of medium stiff to stiff, damp, red silt with trace clay.	S-5@9.5' MC=55%
	Test pit terminated at 10.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-18
Approximate ground surface elevation: 405 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Soft, wet, dark brown, SILT with some gravel, organic debris and roots. (Topsoil)	
1.0-7.0	Very dense, moderately weathered, sub-rounded basaltic andesite boulders in matrix of medium dense, moist, orange-gray, silty SAND to sandy SILT.	
	Test pit completed at 7.0 on feet on 11/2/01 with refusal on boulder. No groundwater seepage observed. No caving observed.	

Test Pit TP-19
Approximate ground surface elevation: 402 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Soft, wet, dark brown, SILT with some clay and sand, organic debris and roots. (Topsoil)	
0.8-2.5	Loose to medium dense, moist, orange-gray, silty SAND to sandy SILT with occasional cobbles and boulders of severely weathered basalt.	S-1@2’
2.5-7.5	Very dense basaltic andesite boulders from 2 to 8 feet in diameter in a medium stiff, sandy SILT matrix.	
	Test pit completed at 7.5 feet on 11/2/01 with refusal on boulder. No groundwater seepage observed. No caving observed.	

Test Pit TP-20
Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Grass over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine roots to 0.8 feet, sparse medium roots to 1.2 feet.	
0.8-2.5	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@1.5’ MC=28%
2.5-10.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional, gray, moderately weathered, round basaltic andesite cobbles and boulders.	S-2@4.0’ MC=56%
	Test pit terminated at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-21
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.3	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine to medium roots to 1.5 feet.	S-1@0.5’
1.3-9.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@2.0’
9.5-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-22
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine and medium roots to 1.0 feet.	
1.0-6.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	
6.5-10.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-23
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Wood debris and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine and medium roots to 1.0 feet.	S-1@0.5' MC=25%
0.7-6.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 1.75 tsf. Pocket penetrometer at 3.5 feet = 3.0 to >4.5 tsf.	S-2@1.5' MC=26%
6.5-7.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	
	Test pit terminated at 7.5 feet due to space constraints on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-24
Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Metal debris over soft, damp, brown, blocky, SILT with trace fine sand. (Fill) Trace fine roots to 0.7 feet.	S-1@0.5' S-2@1.0'
0.8-1.5	Soft to medium stiff, moist, brown, SILT with trace clay. (FILL)	
1.5-3.5	Soft to medium stiff to stiff, moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-3@2.5'
3.5-4.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	
	Test pit terminated at 4.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-25
Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.5	Wrecking yard debris over soft to medium stiff, damp, brown, SILT with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and wrecking yard debris. (Fill) Trace fine to medium roots to 1.0 feet.	S-1@0.5' S-2@2.0'
4.5-7.5	Medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
7.5-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3@10.5'
	Test pit terminated at 10.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-26
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.4	1-inch of asphalt over 3-inches of 5/8" minus crushed rock base.	S-1@0.5' MC=26%
0.4–1.1	Soft to medium stiff, damp to moist, brown, SILT with trace fine sand and occasional gravel (Topsoil prior to paving.) Trace fine to medium roots to 0.6 feet. Pocket penetrometer at 1.0 feet > 1.5 tsf.	S-2@1.0' MC=27%
1.1-4.5	Medium stiff to stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders. Pocket penetrometer at 2.5 feet = A.5 tsf.	S-3@2.5' MC=37%
4.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay to silty SAND.	S-4@10.5' MC=46%
	Test pit terminated at 11.0 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-27
Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.6	Grass over loose, damp to wet, brown silty GRAVEL and wrecking yard debris. (FILL). Trace fine to medium roots to 1.6 feet.	S-1@0.5’
0.6–1.3	Soft to medium stiff, damp, brown, SILT with trace fine sand and occasional gravel (Relic topsoil)	
1.3-3.0	Medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@1.5’
3.0-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-28
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Blackberry vines over loose, damp to wet, brown silty GRAVEL and wrecking yard debris. (FILL) Trace fine to medium roots to 1.5 feet.	S-1@0.5' MC=16%
0.8–1.5	Soft to medium stiff, damp to moist, dark brown, SILT with trace fine sand and occasional gravel. (Relic topsoil)	S-2@1.0' MC=32%
1.3-3.2	Medium stiff to stiff, moist, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-3@2.5' MC=31%
3.2-8.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite and boulders.	S-4@6.0' MC=57%
	Test pit terminated at 8.5 feet on a boulder on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-29
Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.0	Grass over soft to medium stiff, damp to moist, brown, SILT with gravel and occasional asphalt debris. (Fill) Dense fine roots to 0.5 feet.	S-1@1.5'
4.0-7.5	Medium stiff to stiff, moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@5.0'
7.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	
	Test pit terminated at 11.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-30
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.8	Grass and gravel over soft to medium stiff, damp to moist, brown, SILT with gravel and occasional asphalt debris. (FILL) Moderate fine roots to 0.3 feet. Occasional gray, moderately weathered, round, basaltic andesite boulders.	S-1@1.0’
1.8-6.0	Medium stiff to stiff, moist, orange-brown grading to red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
6.0-11.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 11.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-31
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-5.0	Grass and gravel over soft to medium stiff, damp to moist, brown, SILT with gravel and occasional asphalt debris. (FILL) Moderate fine roots to 1.1 feet.	
5.0-9.5	Medium stiff to stiff, moist, orange-brown grading to red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@6.0’ MC=25%
9.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2@11.0’ MC=53%
	Test pit terminated at 11.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-32
Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0–1.0	Blackberry vines over loose, damp to moist, dark brown, SILT with gravel and occasional metal debris. (Topsoil/FILL) Moderate fine to medium roots to 1.2'.	S-1@0.5' MC=11%
1.0-1.7	Soft to medium stiff, damp, light brown, SILT with trace sand and occasional gravel and metal debris. (FILL)	S-2@1.3' MC=25%
1.7-3.0	Medium stiff, damp, light brown, SILT with occasional asphalt and metal debris. (FILL)	S-3@2.5' MC=20%
3.0-4.7	Medium stiff, damp, reddish-brown, SILT with occasional fine to medium roots.	
4.7-9.0	Medium stiff to stiff, moist, orange-brown grading to reddish-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-4@7.5' MC=27%
9.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-5@9.5'

Test pit terminated at 11.0 feet on 11/2/01.
No groundwater seepage observed.
No caving observed.
Fill was from Molalla Avenue cut, approximately 50 years ago, according to Rocky Younger, property owner.

Test Pit TP-33
Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Short grass, blackberry vines, and metal debris over soft, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel. (Topsoil/FILL) Moderate fine to medium roots to 1.0 feet.	S-1@0.8’
1.0-5.5	Medium stiff, damp, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
5.5-11.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 11.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-34
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-2.0	Short grass and metal debris over medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@1.5’ MC=41%
2.0-12.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2@9.5’ MC=66% S-3@12.0’ MC=62%
	Test pit terminated at 12.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-35
Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Metal debris over loose, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel and wrecking yard debris. (Topsoil/FILL) Moderate fine and medium roots to 1.0 feet.	S-1@0.5’
1.0-3.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
3.5-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-36
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines and metal debris over soft to medium stiff, damp to moist, brown, SILT with trace fine sand and wrecking yard debris (Topsoil/FILL) Moderate fine and medium roots to 1.0 feet. Pocket penetrometer at 1.0 feet = 1.5 tsf.	S-1@1.0’ MC=29%
1.0-5.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 1.5 tsf. Pocket penetrometer at 2.5 feet = 2.5 tsf.	S-2@2.0’ MC=29%
5.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3@10.5’ MC=50%
	Test pit terminated at 11.0 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-37
Approximate ground surface elevation: 431 Feet

Depth (feet)	Material Description	Sample No.
0.0-5.0	Blackberry vines over soft to medium stiff, damp to moist, brown, SILT with significant large pieces of concrete and asphalt debris. (FILL) Moderate fine and medium roots to 1.4 feet.	S-1@1.0' MC=19%
5.0-8.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@7.0' MC=35%
8.0-12.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3@10.0' MC=50%
	Test pit terminated at 12.5 feet on a boulder on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-38
Approximate ground surface elevation: 431 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines and short grass over medium dense, moist to wet, brown, silty sandy GRAVEL with significant asphalt debris (FILL) Moderate fine and medium roots to 0.8 feet.	S-1@0.5'
1.0-5.5	Soft to medium stiff, damp, orange-brown SILT with significant large pieces of asphalt and concrete debris. (FILL)	S-2@2.0'
	Digging refusal at 5.5 feet due on concrete debris on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-39
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Duff and asphalt debris over soft to medium stiff, damp to moist, orange-brown, SILT with some sand and occasional asphalt debris and 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-1@1.0' MC=46%
3.5-7.5	Soft to medium stiff, moist, brown, SILT with organics, and occasional wood and metal debris. (FILL)	S-2@4.0' MC=26% S-3@7.0' MC=28%
7.5-10.5	Medium stiff to stiff, damp to moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
10.5-13.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders.	S-4@11.5' MC=42%
	Test pit terminated at 13.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-40
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.9	Duff over soft, damp, brown, SILT with trace fine sand. (Topsoil) Sparse fine roots to 1.0 feet and sparse medium roots to 1.9 feet.	S-1@1.0' MC=23%
1.9-3.0	Medium stiff, damp, orange-brown, sandy SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders. Pocket penetrometer at 2.0 feet >4.5 tsf.	S-2@2.5' MC=21%
3.0-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders.	S-3@5.5' MC=21%
	Test pit completed at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-41
Approximate ground surface elevation: 441 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Duff over soft, damp to moist, brown, SILT with trace fine sand and occasional gravel. (Topsoil) Moderate fine to medium roots to 1.2 feet and sparse large roots to 1.5 feet.	S-1@0.5-2.0' S-1A@0.5-2.5'
1.5-2.5	Soft grading to stiff, damp, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders.	S-2@2.5' MC=26%
2.5-6.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders.	S-3@5.5'
	Digging refusal at 10.0 feet on a boulder on 11/3/01. No groundwater seepage observed. No caving observed. Samples S-1 and S-1A were shelby tube samples.	

Test Pit TP-42
Approximate ground surface elevation: 432 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Soft to medium stiff, wet, brown grading to orange-brown, SILT with some sand, organic debris and roots to 3". (Topsoil)	
1.0-4.0	Soft grading to stiff, damp, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders.	
4.0-6.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders to 3 feet in diameter.	
	Test pit completed at 6.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-43
Approximate ground surface elevation: 426 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Medium stiff, moist to wet, orange-brown, sandy SILT with some gravel, clay, and debris consisting of concrete, asphalt, crushed rock, and wire. (Fill)	S-1@1'
3.5-7.8	Soft to medium stiff, wet, dark gray-brown, SILT with some clay, sand and gravel. Occasional clasts of concrete, asphalt, brick and trace organic material. (Fill)	S-2@5'
7.8-8.0	Pine needles and thin branches to 1-inch in diameter. (Fill)	
8.0-11.0	Large andesitic boulder encountered at east end of test pit. Boulder appeared to be in a matrix of stiff to medium stiff, gray-brown SILT. (Fill)	
	Test pit completed at 11.0 feet on 3/4/02. Very slight seepage observed at 9 feet at time of exploration. No caving observed.	

Test Pit TP-44
Approximate ground surface elevation: 421.5 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.3	Grass sod.	
0.3-6.0	Soft to medium stiff, wet, orange-brown, sandy SILT with some clay and gravels. Occasional clasts of asphalt and concrete to 2 feet in diameter. 2-½ foot diameter andestitic boulder encountered at 1.5 feet. (Fill)	S-1@2'
6.0-8.0	Soft grading to stiff, wet, orange-brown, SILT with some clay and trace to some gray, sub-rounded clasts of severely weathered basaltic ardisite.	
8.0-11.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular to sub-rounded, poorly sorted basaltic andesite clasts in a matrix of medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay.	
	Test pit completed at 11.0 feet on 3/4/02. No groundwater observed at time of exploration. No caving observed.	

Test Pit TP-45
Approximate ground surface elevation: 433.5 Feet

Depth (feet)	Material Description	Sample No.
0.0-2.5	Soft grading to stiff, moist, orange-brown, SILT with trace to some clay, sand, and 3 inch minus fragments of severely weathered basaltic andesite.	S-1@1'
2.5-6.0	Very dense, damp, gray, moderately weathered andesitic boulders to 3 feet in diameter in a matrix of medium stiff to stiff, moist to wet, orange-brown, SILT with trace clay to silty SAND with trace clay. Boulders sub-angular to rounded.	
	Test pit completed at 6.0 feet with refusal on 6-foot diameter andesitic boulder. No groundwater observed at time of exploration. No caving observed.	

Test Pit TP-46
Approximate ground surface elevation: 438 Feet

Depth (feet)	Material Description	Sample No.
0.0-6.0	Concrete and asphalt debris with matrix of sandy GRAVEL with some silt (dirty crushed rock). Approximately 40% asphalt and 20% concrete based on visual estimation. (Fill)	
6.0-7.0	Soft to medium stiff, moist, orange-brown, SILT with some sand and clay.	
	Test pit completed at 7 feet on 3/4/02. No groundwater seepage observed at time of exploration. No caving observed.	

Test Pit TP-47
Approximate ground surface elevation: 435 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.2	Grass sod.	
0.2-3.0	Asphalt debris in matrix of sandy gravel with some silt (crushed rock). Approximately 40-50% asphalt based on visual estimation. (Fill)	S-1@1'
3.0-6.0	Medium stiff, moist, orange-brown, sandy SILT with some gravel and trace clay. (Fill)	
6.0-8.5	Soft grading to stiff, moist, orange-brown, SILT with trace to some clay, sand, and 3 inch minus fragments of severely weathered basaltic andesite.	S-2@4'
8.5-11.0	Very dense, damp, gray, moderately weathered andesitic boulders to 3 feet in diameter in a matrix of medium stiff to stiff, moist to wet, orange-brown, SILT with trace clay to silty SAND with trace clay. Boulders sub-angular to rounded.	
	Test pit completed at 11.0 feet on 3/4/02. No groundwater seepage observed at time of exploration. No caving observed.	

Test Pit TP-48
Approximate ground surface elevation: 433 Feet

Depth (feet)	Material Description	Sample No.
0.0-5.5	Stiff to medium stiff, moist to wet, orange-brown, SILT with some sand and trace clay and occasional clasts of asphalt and concrete. (Fill)	
5.5-10.0	Randomly oriented rebar reinforced concrete debris from 6 to 8 inches thick and up to 4 feet across. Approximately 5% of debris consisted of rebar, asphalt, and wire. (Fill)	
	Test pit completed at 10.0 feet on 3/4/02 due to refusal on large concrete debris. No groundwater seepage observed at time of exploration. No caving observed.	

Test Pit TP-1A
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-6.0	Duff and asphalt debris over very soft to medium stiff, moist, reddish-brown, SILT with some sand and occasional asphalt debris and 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-1 @ 0.5' S-2 @ 2'
6.0-9.0	Soft to medium stiff, moist, gray SILT with organic and metal debris and occasional cobbles of of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-3 @ 8'
9.0-12.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-4 @ 9.5'
	Test pit terminated at 12.0 feet on 03/01/2002. Slight groundwater seepage observed at 9.0 feet, perched on native soils. No caving observed.	

Test Pit TP-2A
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Duff over 7-inches of asphalt over 3-inches of 3/8-inch minus crushed rock base.	S-1 @ 1'
0.8-8.0	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-2 @ 8'
8.0-9.0	Soft, damp to moist, light gray to dark gray, SILT with trace clay and wood, metal, glass, and rubber debris. (FILL)	
9.0-11.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
	Test pit terminated at 11.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-3A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.3	Metal debris over soft, damp to moist, gray SILT with trace clay and occasional fine rootlets. Slight to moderate odor of oil impact. (FILL)	
0.3-7.5	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-1 @ 0.5' S-2 @ 2'
7.5-8.0	Soft, damp to moist, orange-brown silt with trace clay and fine rootlets. (Relict topsoil horizon)	
8.0-12.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 12.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-4A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Metal debris over 5/8-inch minus crushed rock base. Very strong odor of oil impact. Visible free product (appears to be crankcase oil) in crushed rock. (FILL)	S-1 @ 1'
1.5-8.0	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-2 @ 3' S-3 @ 7'
8.0-10.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
	Test pit terminated at 12.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-5A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Metal debris and grass over very soft, damp, gray SILT with trace clay and gravel. (FILL)	S-1 @ 1'
1.0-8.5	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-2 @ 8'
8.5-9.0	Loose, damp, brown-gray SILT with trace clay, occasional gravel and fine rootlets. (Relict topsoil horizon.)	
9.0-11.0	Medium stiff, damp, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 11.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-6A

Approximate ground surface elevation: 431 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines and short grass over soft, damp, dark gray SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	
1.0-6.0	Soft to medium stiff, damp, red-brown SILT with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and large pieces of asphalt and concrete debris. (FILL)	S-1@2.0'
6.0-6.5	Medium dense, damp, gray sandy SILT with some gravel. (FILL)	
	Digging refusal at 6.5 feet due on concrete debris on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-7A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.4	8-inches of asphalt over 8-inches of 3/8-inch minus crushed rock base. Very strong odors of gasoline and weathered gasoline. Gasoline dissolving asphalt.	
1.4-2.5	Soft, moist, red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and gravel. (FILL)	S-1 @ 1.5'
2.5-5.0	Soft to medium stiff, moist, red-brown SILT with trace clay and occasional 3-inch minus, gray angular fragments of severely to highly weathered, highly fractured basaltic andesite.	S-2 @ 3.5'
5.0-9.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-3 @ 6' S-4 @ 6.5'
	Test pit terminated at 9.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-8A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Soft, damp to moist, dark brown SILT with trace clay and occasional gravel.	
1.0-3.5	Soft to medium stiff, damp, red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and gravel.	S-1 @ 3'
3.5-7.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay	S-2 @ 6.5'
	Test pit terminated at 7.5 feet on 03/01/2002. Moderate groundwater seepage observed at 6.5 feet. Slight caving observed below 6.5 feet.	

Test Pit TP-9A

Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Medium dense, damp, dark gray silty sandy GRAVEL with occasional cobbles. (FILL)	S-1 @ 1.5'
3.5-5.5	Soft to medium stiff, damp to moist, orange-red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 3.5'
5.5-9.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-3 @ 9.5'
	Test pit terminated at 9.5 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-10A

Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Loose to medium dense, damp, gray-brown SILT with trace clay and trace fine sand and occasional fine highly weathered, highly fractured basaltic andesite gravel.	S-1 @ 1'
1.5-4.5	Soft to medium stiff, damp, orange-red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 2'
4.5-6.5	Medium stiff to stiff, damp, red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
6.5-7.0	Medium dense to very dense, gray, highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-3 @ 7'
	Test pit terminated at 7.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-11A

Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Sparse grass and metal debris over 5/8-inch minus crushed rock base. (FILL)	
0.8-2.0	Soft to medium stiff, damp, gray, SILT with trace clay and occasional metal, rubber, and glass debris. Slight odor of weathered gasoline and slight staining observed. (FILL)	S-1 @ 1.5'
2.0-4.5	Soft to medium stiff, damp, red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2 @ 3'
4.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-3 @ 5.5' S-4 @ 11'
	Test pit terminated at 11.0 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-12A

Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Grass and blackberry vines over soft, damp, dark brown, SILT with trace fine sand, trace clay and occasional gray, highly weathered, round, basaltic andesite gravel.	
1.0-4.0	Medium stiff to stiff, damp to moist, reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
4.0-10.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, wet grading to damp, yellow silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-1 @ 4'
	Test pit terminated at 10.0 feet on 03/02/2002 Very slight groundwater seepage observed at 4 feet. No caving observed.	

Test Pit TP-13A

Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Metal debris over loose, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel and debris. (Topsoil/FILL)	
1.0-4.0	Medium stiff to stiff, damp to moist, reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@1'
4.0-9.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2 @ 4.5' S-3 @ 9'

Test pit terminated at 9.5 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-14A

Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-2.0	Loose, damp, gray, SILT with trace clay and occasional pockets of 5/8-inch minus gravel and debris. Slight odor of oil impact to upper foot of soils, slight staining in upper foot of soils. (FILL)	S-1@1'
2.0-4.5	Soft to medium stiff, damp to moist, reddish-orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 2.5'

Test pit terminated at 4.5 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-15A

Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.5	5/8-inch minus crushed rock base over soft to medium stiff, damp, gray brown, SILT with trace sand and occasional gravel and asphalt debris. (FILL)	S-1 @ 2'
4.5-7.5	Soft to medium stiff, damp, reddish-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 5'
7.5-9.5	Medium dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3 @ 8.5'
9.5-11.5	Dense to very dense, gray, highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-4 @ 11.5'
	Test pit terminated at 11.5 feet on 03/02/2002 No groundwater seepage observed. No caving observed. Cesspool cistern discovered at 1.5 to 5 feet. Test pit relocated to north of cistern, adjacent.	

Test Pit TP-16A

Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.5	Soft, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel. (Topsoil/FILL)	
0.5-2.5	Soft, damp, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1 @ 2'
2.5-9.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2 @ 5' S-3 @ 8.5'
	Test pit terminated at 9.5 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-17A
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.0	4-inches of asphalt over soft, damp, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1 @ 1' S-2 @ 3'
4.0-10.0	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay to silty SAND.	S-3 @5.5' S-4 @ 9'

Test pit terminated at 10.0 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-18A
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-6.0	Broken asphalt over soft grading to medium stiff, damp, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1 @ 3'
6.0-10.0	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay to silty SAND.	S-2 @ 6' S-3 @ 10'

Test pit terminated at 10.0 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-19A

Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	2-inches of 5/8-inch minus crushed rock over soft, damp to moist, dark brown-gray, SILT with trace clay, occasional gravel and occasional metal debris. (FILL)	S-1 @ 1'
1.5-5.0	Medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 3'
5.0-8.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3 @ 7'
	Test pit terminated at 8.0 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-20A

Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Gravel over soft to medium stiff, damp, reddish-brown, SILT with gravel and trace clay and occasional asphalt debris. Occasional gray, moderately weathered, round, basaltic andesite boulders. (FILL).	S-1 @ 2'
3.5-4.0	Soft to medium stiff, damp, brown, SILT with trace clay and fine rootlets. (Relict topsoil horizon.)	
4.0-9.0	Medium stiff, damp, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 4' S-3 @ 7'
9.0-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to wet, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-4 @ 9.5'
	Test pit terminated at 10.0 feet on 03/02/2002. Moderate groundwater seepage observed at 9.5 feet. No caving observed.

Terracon GeoReport

SAMPLING	WATER LEVEL	FIELD TESTS
Rock Core Grab Sample Standard Penetration Test	**Water Initially Encountered** **Water Level After a Specified Period of Time** **Water Level After a Specified Period of Time** **Cave In Encountered** Water levels indicated on the soil boring logs are the levels measured in the borehole at the times indicated. Groundwater level variations will occur over time. In low permeability soils, accurate determination of groundwater levels is not possible with short term water level observations.	**N** Standard Penetration Test Resistance (Blows/Ft.) **(HP)** Hand Penetrometer **(T)** Torvane **(DCP)** Dynamic Cone Penetrometer **UC** Unconfined Compressive Strength **(PID)** Photo-Ionization Detector **(OVA)** Organic Vapor Analyzer

DESCRIPTIVE SOIL CLASSIFICATION

Soil classification as noted on the soil boring logs is based Unified Soil Classification System. Where sufficient laboratory data exist to classify the soils consistent with ASTM D2487 "Classification of Soils for Engineering Purposes" this procedure is used. ASTM D2488 "Description and Identification of Soils (Visual-Manual Procedure)" is also used to classify the soils, particularly where insufficient laboratory data exist to classify the soils in accordance with ASTM D2487. In addition to USCS classification, coarse grained soils are classified on the basis of their in-place relative density, and fine-grained soils are classified on the basis of their consistency. See "Strength Terms" table below for details. The ASTM standards noted above are for reference to methodology in general. In some cases, variations to methods are applied as a result of local practice or professional judgment.

LOCATION AND ELEVATION NOTES

Exploration point locations as shown on the Exploration Plan and as noted on the soil boring logs in the form of Latitude and Longitude are approximate. See Exploration and Testing Procedures in the report for the methods used to locate the exploration points for this project. Surface elevation data annotated with +/- indicates that no actual topographical survey was conducted to confirm the surface elevation. Instead, the surface elevation was approximately determined from topographic maps of the area.

STRENGTH TERMS

RELATIVE DENSITY OF COARSE-GRAINED SOILS (More than 50% retained on No. 200 sieve.) Density determined by Standard Penetration Resistance		CONSISTENCY OF FINE-GRAINED SOILS (50% or more passing the No. 200 sieve.) Consistency determined by laboratory shear strength testing, field visual-manual procedures or standard penetration resistance		
Descriptive Term (Density)	**Standard Penetration or N-Value Blows/Ft.**	**Descriptive Term (Consistency)**	**Unconfined Compressive Strength Qu, (tsf)**	**Standard Penetration or N-Value Blows/Ft.**
Very Loose	0 - 3	Very Soft	less than 0.25	0 - 1
Loose	4 - 9	Soft	0.25 to 0.50	2 - 4
Medium Dense	10 - 29	Medium Stiff	0.50 to 1.00	4 - 8
Dense	30 - 50	Stiff	1.00 to 2.00	8 - 15
Very Dense	> 50	Very Stiff	2.00 to 4.00	15 - 30
		Hard	> 4.00	> 30

RELEVANCE OF SOIL BORING LOG

The soil boring logs contained within this document are intended for application to the project as described in this document. Use of these soil boring logs for any other purpose may not be appropriate.

Criteria for Assigning Group Symbols and Group Names Using Laboratory Tests [A]					Soil Classification	
					Group Symbol	Group Name [B]
Coarse-Grained Soils: More than 50% retained on No. 200 sieve	**Gravels:** More than 50% of coarse fraction retained on No. 4 sieve	**Clean Gravels:** Less than 5% fines [C]	$Cu \geq 4$ and $1 \leq Cc \leq 3$ [E]		GW	Well-graded gravel [F]
			$Cu < 4$ and/or [Cc<1 or Cc>3.0] [E]		GP	Poorly graded gravel [F]
		Gravels with Fines: More than 12% fines [C]	Fines classify as ML or MH		GM	Silty gravel [F, G, H]
			Fines classify as CL or CH		GC	Clayey gravel [F, G, H]
	Sands: 50% or more of coarse fraction passes No. 4 sieve	**Clean Sands:** Less than 5% fines [D]	$Cu \geq 6$ and $1 \leq Cc \leq 3$ [E]		SW	Well-graded sand [I]
			$Cu < 6$ and/or [Cc<1 or Cc>3.0] [E]		SP	Poorly graded sand [I]
		Sands with Fines: More than 12% fines [D]	Fines classify as ML or MH		SM	Silty sand [G, H, I]
			Fines classify as CL or CH		SC	Clayey sand [G, H, I]
Fine-Grained Soils: 50% or more passes the No. 200 sieve	**Silts and Clays:** Liquid limit less than 50	**Inorganic:**	PI > 7 and plots on or above "A"		CL	Lean clay [K, L, M]
			PI < 4 or plots below "A" line [J]		ML	Silt [K, L, M]
		Organic:	Liquid limit - oven dried / Liquid limit - not dried	< 0.75	OL	Organic clay [K, L, M, N] / Organic silt [K, L, M, O]
	Silts and Clays: Liquid limit 50 or more	**Inorganic:**	PI plots on or above "A" line		CH	Fat clay [K, L, M]
			PI plots below "A" line		MH	Elastic Silt [K, L, M]
		Organic:	Liquid limit - oven dried / Liquid limit - not dried	< 0.75	OH	Organic clay [K, L, M, P] / Organic silt [K, L, M, Q]
Highly organic soils:	Primarily organic matter, dark in color, and organic odor				PT	Peat

[A] Based on the material passing the 3-inch (75-mm) sieve.

[B] If field sample contained cobbles or boulders, or both, add "with cobbles or boulders, or both" to group name.

[C] Gravels with 5 to 12% fines require dual symbols: GW-GM well-graded gravel with silt, GW-GC well-graded gravel with clay, GP-GM poorly graded gravel with silt, GP-GC poorly graded gravel with clay.

[D] Sands with 5 to 12% fines require dual symbols: SW-SM well-graded sand with silt, SW-SC well-graded sand with clay, SP-SM poorly graded sand with silt, SP-SC poorly graded sand with clay.

[E] $Cu = D_{60}/D_{10}$ $\quad Cc = \dfrac{(D_{30})^2}{D_{10} \times D_{60}}$

[F] If soil contains ≥ 15% sand, add "with sand" to group name.

[G] If fines classify as CL-ML, use dual symbol GC-GM, or SC-SM.

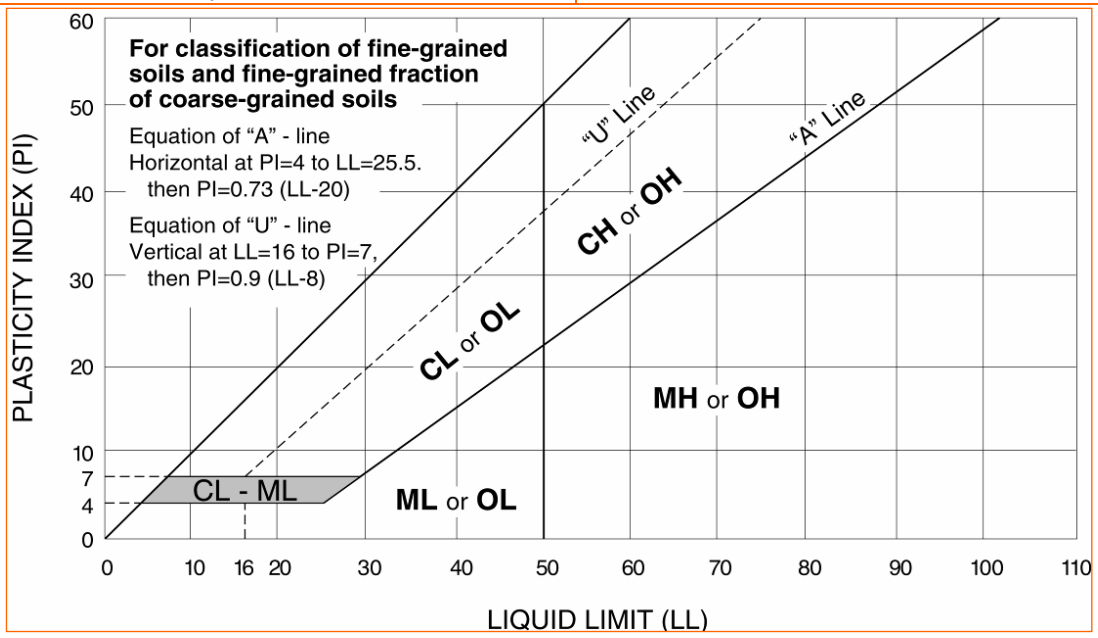
[H] If fines are organic, add "with organic fines" to group name.

[I] If soil contains ≥ 15% gravel, add "with gravel" to group name.

[J] If Atterberg limits plot in shaded area, soil is a CL-ML, silty clay.

[K] If soil contains 15 to 29% plus No. 200, add "with sand" or "with gravel," whichever is predominant.

[L] If soil contains ≥ 30% plus No. 200 predominantly sand, add "sandy" to group name.



[M] If soil contains ≥ 30% plus No. 200, predominantly gravel, add "gravelly" to group name.

[N] PI ≥ 4 and plots on or above "A" line.

[O] PI < 4 or plots below "A" line.

[P] PI plots on or above "A" line.

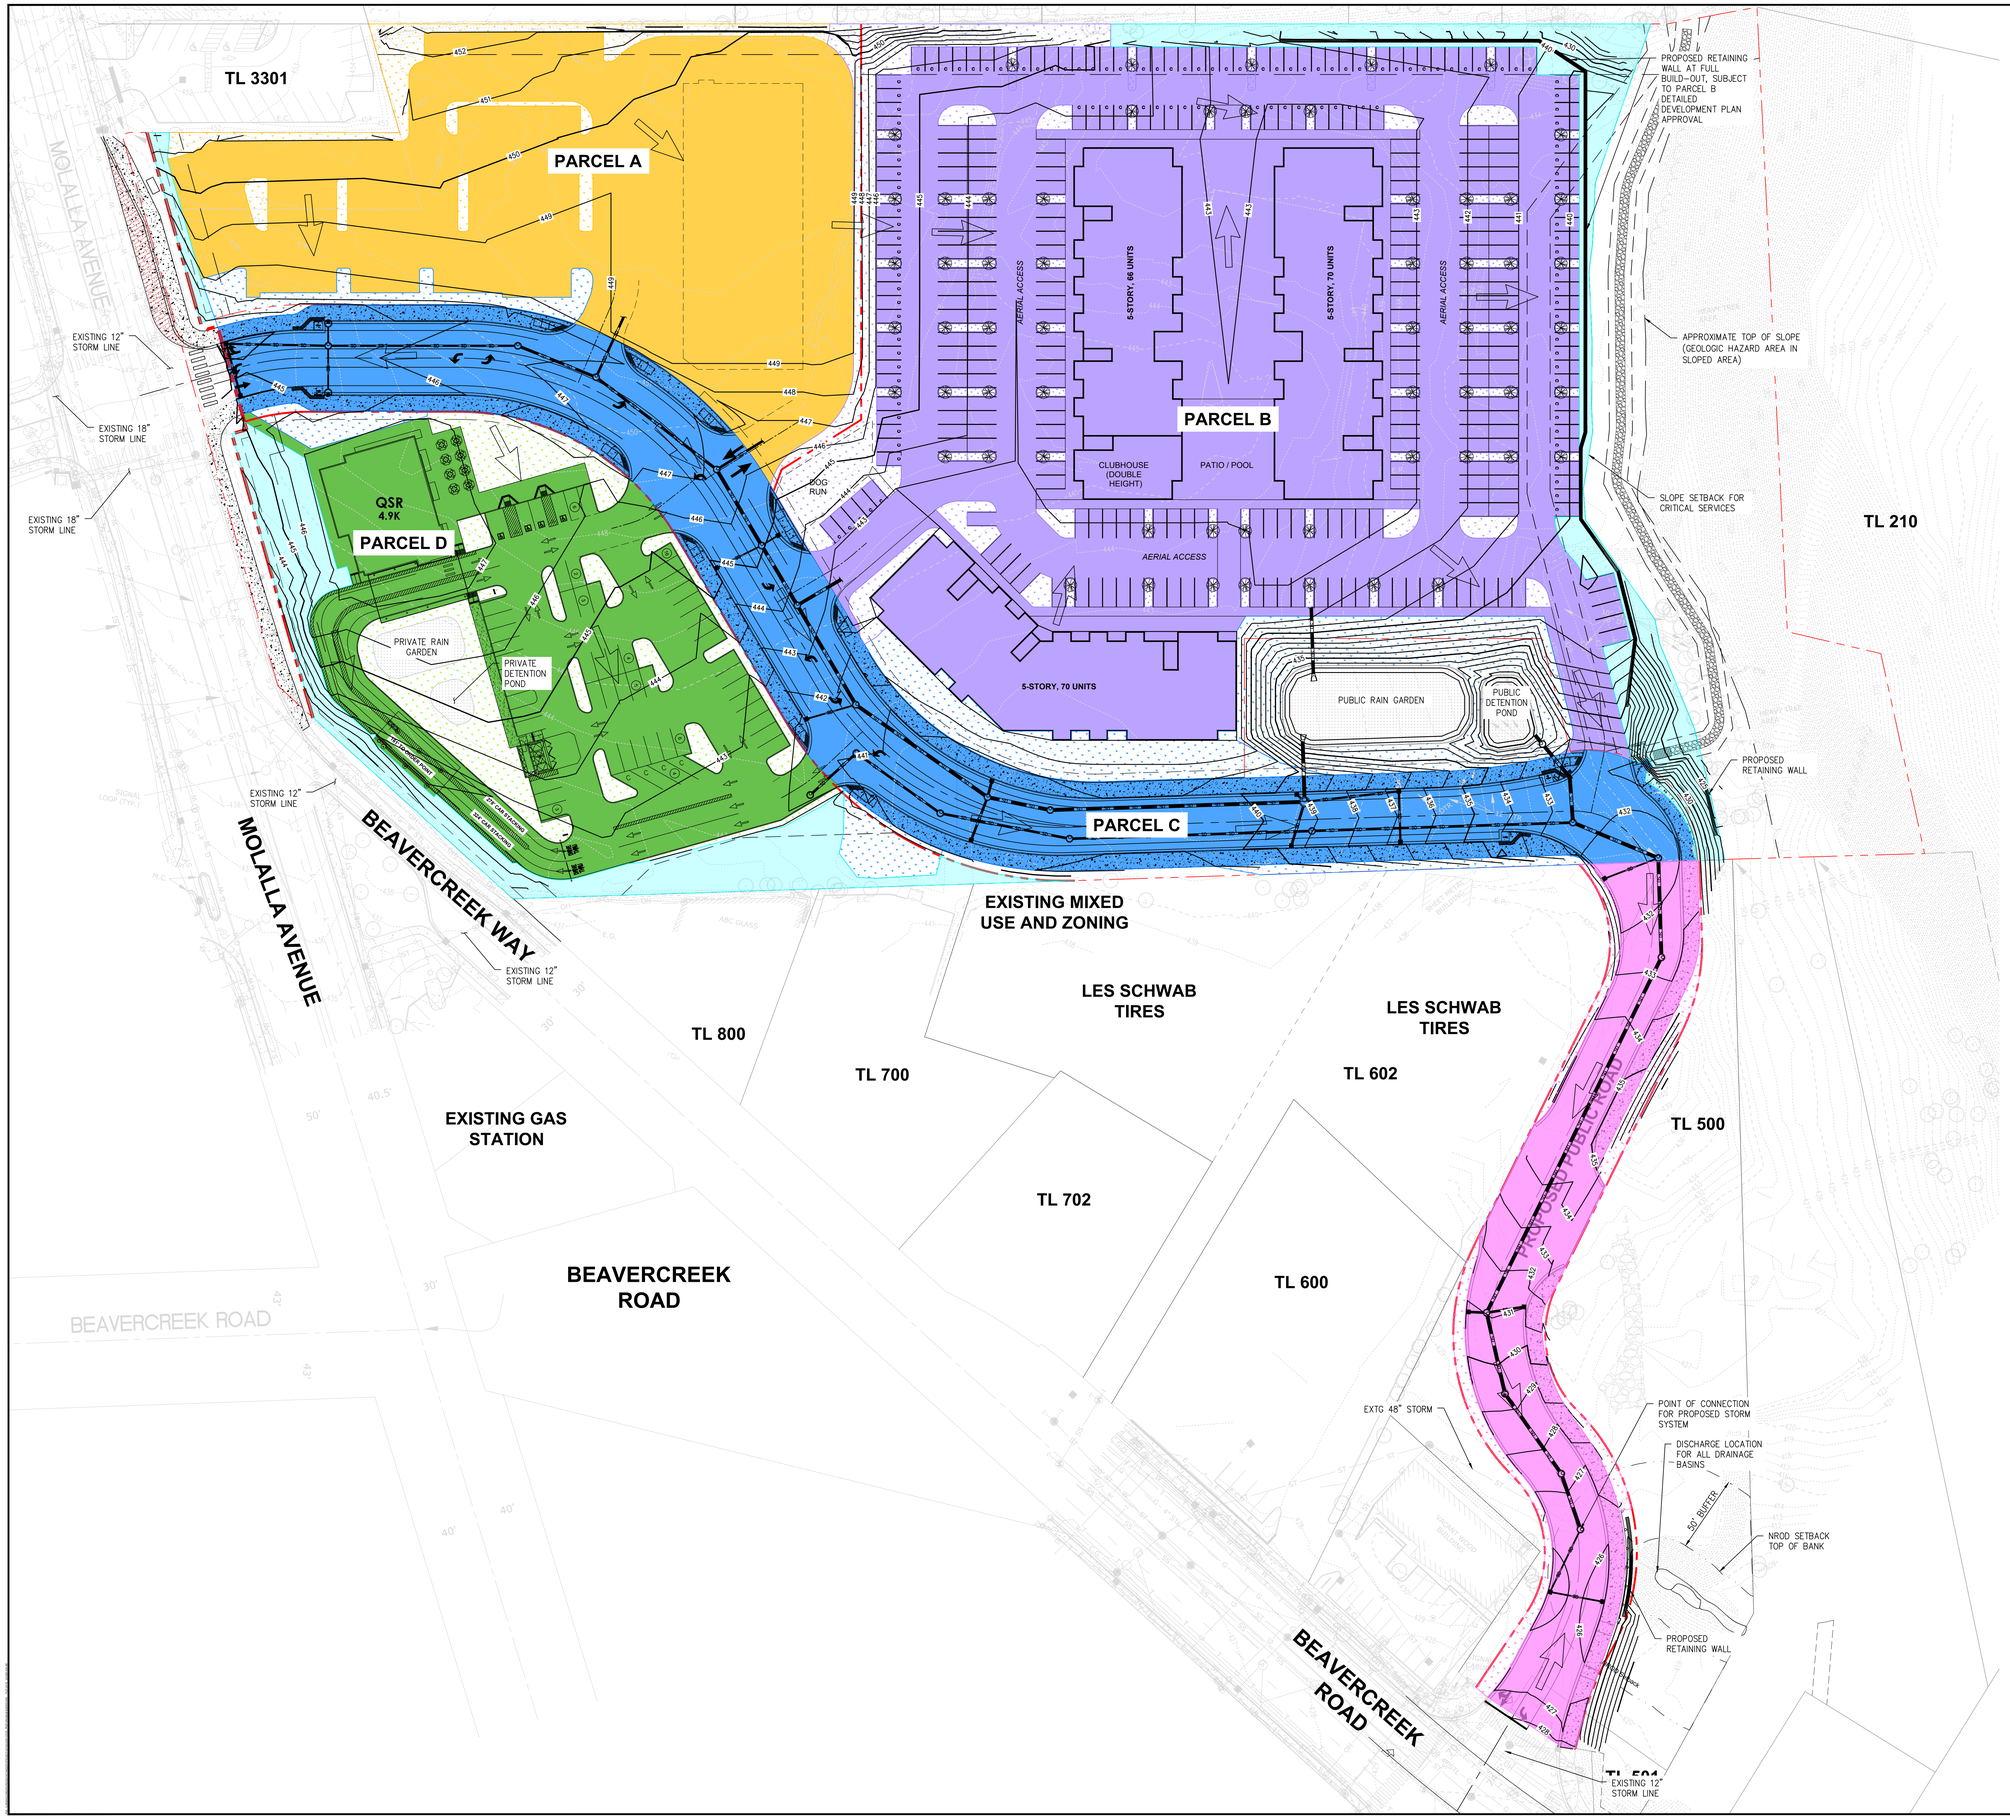
[Q] PI plots below "A" line.

WEATHERING	
Term	**Description**
Unweathered	No visible sign of rock material weathering, perhaps slight discoloration on major discontinuity surfaces.
Slightly weathered	Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discolored by weathering and may be somewhat weaker externally than in its fresh condition.
Moderately weathered	Less than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a continuous framework or as corestones.
Highly weathered	More than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a discontinuous framework or as corestones.
Completely weathered	All rock material is decomposed and/or disintegrated to soil. The original mass structure is still largely intact.
Residual soil	All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported.

STRENGTH OR HARDNESS		
Description	**Field Identification**	**Uniaxial Compressive Strength, psi (MPa)**
Extremely weak	Indented by thumbnail	40-150 (0.3-1)
Very weak	Crumbles under firm blows with point of geological hammer, can be peeled by a pocket knife	150-700 (1-5)
Weak rock	Can be peeled by a pocket knife with difficulty, shallow indentations made by firm blow with point of geological hammer	700-4,000 (5-30)
Medium strong	Cannot be scraped or peeled with a pocket knife, specimen can be fractured with single firm blow of geological hammer	4,000-7,000 (30-50)
Strong rock	Specimen requires more than one blow of geological hammer to fracture it	7,000-15,000 (50-100)
Very strong	Specimen requires many blows of geological hammer to fracture it	15,000-36,000 (100-250)
Extremely strong	Specimen can only be chipped with geological hammer	>36,000 (>250)

DISCONTINUITY DESCRIPTION			
Fracture Spacing (Joints, Faults, Other Fractures)		**Bedding Spacing (May Include Foliation or Banding)**	
Description	**Spacing**	**Description**	**Spacing**
Extremely close	< ¾ in (<19 mm)	**Laminated**	< ½ in (<12 mm)
Very close	¾ in – 2-1/2 in (19 - 60 mm)	**Very thin**	½ in – 2 in (12 – 50 mm)
Close	2-1/2 in – 8 in (60 – 200 mm)	**Thin**	2 in – 1 ft. (50 – 300 mm)
Moderate	8 in – 2 ft. (200 – 600 mm)	**Medium**	1 ft. – 3 ft. (300 – 900 mm)
Wide	2 ft. – 6 ft. (600 mm – 2.0 m)	**Thick**	3 ft. – 10 ft. (900 mm – 3 m)
Very Wide	6 ft. – 20 ft. (2.0 – 6 m)	**Massive**	> 10 ft. (3 m)

Discontinuity Orientation (Angle): Measure the angle of discontinuity relative to a plane perpendicular to the longitudinal axis of the core. (For most cases, the core axis is vertical; therefore, the plane perpendicular to the core axis is horizontal.) For example, a horizontal bedding plane would have a 0-degree angle.



ROCK QUALITY DESIGNATION (RQD) [1]	
Description	**RQD Value (%)**
Very Poor	0 - 25
Poor	25 – 50
Fair	50 – 75
Good	75 – 90
Excellent	90 - 100

1. The combined length of all sound and intact core segments equal to or greater than 4 inches in length, expressed as a percentage of the total core run length.

APPENDIX A
Pre-Application Notes

OREGON CITY
Community Development – Planning
695 Warner Parrott Road | Oregon City OR 97045
Ph (503) 722-3789 | Fax (503) 722-3880

Pre-Application Conference Notes
PA-25-00016 – April 22, 2025
Draft Notes Sent: April 24, 2025
Final Notes Sent: May 1, 2025

These non-binding pre-application conference notes reflect the applicant's submission to the City along with the discussion at the meeting. The applicant has one week from the receipt of the notes to notify City staff of any perceived mistake or omission in the notes; staff will then review and respond to the inquiry, and the inquiry will be added to the City's file. If no notification is received within 7 business days, the notes will be considered final and will not be modified. See additional disclaimers at the end of this document.

Proposed Project: Development of two drive-throughs and a multi-family residential lot.

General Information:
1367 Molalla Ave, Oregon City, OR 97045
Clackamas County Map 3-2E-05DB, Tax Lots 3200, 3201, 3300, and 3400
Clackamas County Map 3-2E-05D, Tax Lots 500, 501, and 602

- Zoning: MUC-2 Mixed Use Corridor
- Geologic Hazards Overlay District: Portions of Tax lot 3200, 3400, 500 and 501
- Natural Resources Overlay District: Tax lot 500 and 501

Review Process:

- Applications Anticipated
  - Site Plan and Design Review (*OCMC 17.62*)
  - Conditional Use Permit for Drive-Through facilities in an MUC Zone (*OCMC 17.29.030.A, OCMC 17.56*)
  - Planning Commission Parking Adjustment to Exceed Maximum Parking Spaces permitted (*OCMC 17.52.015*)
  - Modification of setback for building street frontage (*OCMC 17.62.055.D – Siting of Structures*)
  - Planning Commission Variance for Drive-Aisle Location OCMC 17.62.050. B1 and C.1. * Note – Planning staff does not support a variance from this standard.
  - Planning Commission variance for MUC-2 front yard setback and corner side yard setback, unless one additional pedestrian amenities is provided per additional five feet of setback (*OCMC 17.29.060.G.1 and G.3)*.

This application is a **Type III** decision process involving a site plan and design review application. Pursuant with *OCMC Section 17.50.050*, a pre-application conference is valid for a period of six months. The applicant has **180 days** from the date of submittal of a land use application to have a complete application.

Upon a complete application submittal, the applicant is entitled to a decision from the city of approval, approval with conditions, or denial within **120 days** by state law. Type III decisions require a minimum of one public hearing before the Planning Commission and involve the greatest amount of discretion and evaluation of subjective approval standards yet are not required to be heard by the City Commission except upon appeal.

Site Plan and Design Review:

Staff Comments to consider:

1. Intent of the MUC Zone District. Development on this site should conform as much as possible to the intent of the zoning:
   OCMC 17.29.010 – [Mixed Use Corridor] Designated
   The mixed-use corridor (MUC) district is designed to apply along selected sections of transportation corridors... Land uses are characterized by high-volume establishments such as retail, service, office, multi-family residential, lodging, recreation and meeting facilities, or a similar use as defined by the community development director. A mix of high-density residential, office, and small-scale retail uses are encouraged in this district. Moderate density (MUC-1) and high density (MUC-2) options are available within the MUC zoning district.

2. Multi-family residential is a permitted use in the MUC-2 zoning district, subject to Site Plan and Design Review standards.
   OCMC 17.29.020.M – Permitted uses

3. Conditional Use. According to MUC-2 Zoning Conditional Uses, a Drive-through facility requires a **Conditional Use Permit process** (see below).
   OCMC 17.29.030 - Conditional Uses – MUC-1 and MUC-2 zones.
   The following uses are permitted in this district when authorized and in accordance with the process and standards contained in OCMC 17.56:
   A. Drive-through facilities;

4. Building Heights and Elevations. The site plan does not mention building heights and no elevation plans have been submitted; therefore, its compliance with the following code cannot be determined at this time:
   OCMC 17.29.060 – Dimensional Standards – MUC-2.
   B. Minimum building height: Twenty-five feet or two stories except for accessory structures or buildings under one thousand square feet.

   Further minor pre-application conferences will be required for review of building elevations and designs prior to site plan and design review application.

5. The site plan proposes a building location that does not appear to comply with the Dimensional Standards of the Zone. (Parcel B – Multi Family residential cannot be determined since the structure is not shown in the site plan.)
   OCMC 17.29.060 – Dimensional Standards – MUC-2.
   G. Maximum Allowed Setbacks.
   1. Front Yard: five feet. (Parcel A & Parcel D)
   3. Corner Side Yard abutting street: Twenty feet (Parcel A)

   The structure on Parcel A appears to be 69 feet from the front property line along Molalla Ave and 36 feet from the corner side yard property line along the private street. The structure on Parcel D appears to be 61 feet from the front property line. Setbacks may be increased through the Type II process

pursuant to OCMC 17.62.055.D (Siting of Structures) through the provision of one additional pedestrian element for each additional five feet of setback. If no building position adjustments are made, or additional pedestrian elements provided, approval of this site plan would have to go through the **Type III Variance process (**see below).

6. The applicant's submittal does not include documents that show a landscaping plan. Until that aspect is submitted, its compliance with the following code cannot be determined.
OCMC 17.29.060 – Dimensional Standards – MUC-2.
I. Minimum landscaping requirement (including parking lot): Ten percent.

7. The site plan proposes a parking lot with more than the maximum number of automobile spaces allowed by its land use type:
OCMC 17.52.020 – Number of automobile spaces required.
A. The number of parking spaces shall comply with the minimum and maximum standards listed in Table 17.52.020. The parking requirements are based on spaces per one thousand square feet net leasable area unless otherwise stated.
B. ***Table 17.52.020***

Land Use	*Parking Requirements*	
	Minimum	*Maximum*
Retail store, shopping center, restaurants	*4.10*	*5.00*
Multi-family residential	1.00 per unit	2.5 per unit

The building's listed square footage on Parcel D totals 3,800 square feet and would therefore be allowed a maximum number of 19 spaces at the site. The current site plan shows 95 spaces. Parcel A totals 2,100 square feet and would therefore be allowed a maximum of 11 spaces. Parcel B (multi-family) maximum spaces cannot be determined as no plans have been submitted. If no parking lot adjustments are made, approval of this site plan would be subject to the **Type III Planning Commission Adjustment of Parking Standards** process (see below).

Climate Friendly and Equitable Communities
The City is in the process of implementing state-mandated parking code reforms called Climate-Friendly and Equitable Communities (CFEC) (PDF). Among other requirements, the City cannot require any minimum parking within ½ mile of frequent transit corridors. They reduce minimum parking requirements for certain new developments. The following rules went into effect Statewide on January 1, 2023 and will be fully adopted locally before June 30, 2025. Additionally, these requirements require:

- EV Charging Capability for 40% of new parking lot spaces for Multi-Family Development
- EV Charging Capability for 20% of new parking lot spaces for Commercial Development
- 40% tree canopy coverage of parking lots at maturity
- Incentives for solar, wind power within parking lots.

While the minimum parking requirements may have been reduced, all maximum parking space limits will remain.

8. The Development should conform to the bicycle parking standards in OCMC 17.52.040 Bicycle parking standards.

Table A Required Bicycle Parking Spaces
Where two options for a requirement are provided, the option resulting in more bicycle parking applies. Where a calculation results in a fraction, the result is rounded up to the nearest whole number.

Use	Minimum Bicycle Parking	Minimum Bicycle Parking — Covered — The following percentage of bicycle parking is required to be covered
Multi-family (five or more units)	1 per 10 units (minimum of 2)	50% (minimum of 1)
Eating and drinking establishment	1 per 20 auto spaces (minimum of 2)	0%

Based on the maximum parking space requirement above, Parcel A and Parcel D would require 2 bicycle parking spaces and Parcel B is undetermined as no plans were submitted.

9. Development should conform to Parking Lot Landscaping Requirements. Since no landscaping plan was submitted with the Pre-Application Submittal, its compliance with ***OCMC 17.52.060 – Parking Lot Landscaping***, is unclear.
   See OCMC 17.52.060 – Parking Lot Landscaping (relevant sections) for relevant development standards.

10. General Standards. The site plan proposes parking areas that do not appear to comply with the vehicular access and connectivity standards:
    OCMC 17.62.050.B.1 Vehicular Access and Connectivity.
    1. Parking areas shall be located behind the building façade that is closest to the street, below buildings, or on one or both sides of buildings.

    The site plan shows parking areas in front of the building. The applicant may apply for a **Type III Variance** (see below).

11. General Standards. The site plan does not appear to comply with pedestrian pathway standards.
    OCMC 17.62.050.C.1 A well-marked, continuous and protected on-site pedestrian circulation system meeting the following standards shall be provided.
    1. Pathways between all building entrances and the street are required. Pathways between the street and buildings fronting on the street shall be direct and not cross a drive aisle. Exceptions may be allowed by the director where steep slopes, a physically constrained site, or protected natural resources prevent a direct connection or where an indirect route would enhance the design and/or use of a common open space.

    The site plan does not indicate that there will be a pedestrian circulation system with direct pathways that ***does not cross the drive aisle***. The applicant may apply for a **Type III Variance** (see below)

12. Development should conform to the Site Plan & Design Review Purpose for its development type:
    OCMC 17.62.055 – Institutional, office, multi-family, retail, and commercial building standards.
    Purpose. The primary objective of the regulations contained in this section is to provide a range of design choices that promote creative, functional, and cohesive development that is compatible with surrounding areas. Buildings approved in compliance with these standards are intended to serve multiple tenants over the life of the building and are not intended for a one-time occupant. The standards encourage people to spend time in the area, which also provides safety though informal surveillance. Finally, this section is intended to promote the design of an urban environment that is built to human scale by creating buildings and streets that are attractive to pedestrians, create a sense of enclosure, provide activity and interest at the intersection of the public and private spaces, while also accommodating vehicular movement.

13. Siting of Structures. The site plan proposes a building location that does not appear to comply with the Siting of Structures aspect of the City's retail/commercial building standards:

OCMC 17.62.055 – Institutional, office, multi-family, retail, and commercial building standards.

D. Siting of Structures. On sites with one hundred feet or more of frontage at least sixty percent of the site frontage width shall be occupied by buildings placed within five feet of the property line.

The applicant may apply for a Type II Modification of this standard per OCMC 17.62.015, provided the alternative meets the intent of the standards. If a Type II Modification that better meets the design standard is not approved, the applicant may apply for a **Type III Variance** (see below).

The multi-family use on Parcel B will require a separate pre-application. Compliance with applicable standards cannot be determined.

14. Building Orientation. The site plan proposes a building orientation that makes its compliance with the Building Orientation aspect of the City's retail/commercial building standards, unclear:

OCMC 17.62.055 – Institutional, office, multi-family, retail, and commercial building standards.

E. Building Orientation. All buildings along the street frontage shall face the front most architecturally significant facade toward the street and have a functional primary entrance facing the street. Primary building entrances shall be clearly defined and recessed or framed by a sheltering element such as an awning, arcade or portico in order to provide shelter from the summer sun and winter weather.

Without elevation drawings for the site, it is unclear where the front most architecturally significant façade faces. Planning can't determine compliance with the code. According to the current site plan, the functional primary entrance of the building on Parcel A appears to face the parking lot to the east of the building and the entrance on Parcel D appears to face the parking lot at the north end of the building. The primary entrances must face the street.

15. Entryways. The Applicant's submittal does not contain elevation drawings. Therefore, its compliance with the Entryways aspect of the City's retail/commercial building standards is unclear:

OCMC 17.62.055 – Institutional, office, multi-family, retail, and commercial building standards.

F. Entryways. Entrances shall include a doorway and a minimum of four of the following elements:

1. Display windows; recesses or projections; peaked roof or raised parapet over the door; canopy of at least five feet in depth; porch; distinct materials; architectural details such as tile work and moldings; pedestrian amenities such as benches, planters or planter boxes; landscape treatments integrating arbors, low walls, trellis work; or similar elements. Trellises, canopies and fabric awnings may project up to five feet into front setbacks and public rights-of-way, provided that the base is not less than eight feet at the lowest point and no higher than ten feet above the sidewalk.

16. Design Elements. The Applicant's submittal does not contain elevation drawings. Therefore, its compliance with the Design Elements aspect of the City's retail/commercial building standards is unclear:

OCMC 17.62.055 – Institutional, office, multi-family, retail, and commercial building standards.

I. Building Design Elements.

1. All front and side facades shall provide a design element or architectural feature that add interest and detail such that there are no blank walls of thirty feet in length or more, measured horizontally. Features that can meet this requirement include:

a. Change in building material or texture;

b. Window or door;

c. Balcony; or

d. Pillar or post.

2. Street facing facades shall include additional design features. For every thirty feet of façade length, three of the following elements are required:

a. Decorative materials on more than ten percent of the total wall area (e.g., brick or stonework, shingles, wainscoting, ornamentation, and similar features);

b. Decorative cornice and/or roof line (e.g., for flat roofs);

c. Roof gable;

d. Recessed entry;

e. Covered canopy entry;

f. Cupola or tower;

g. Dormer;

h. Balcony;

i. Pillars or posts;

j. Repeating pattern of building materials;

k. A change in plane of at least two feet in width and six inches in depth;

l. Bay or oriel window; or

m. An alternative feature providing visual relief and detail as approved by the community development director.

3. Building Detail Variation. Architectural features shall be varied on different buildings within the same development. At least two of the required features on each street-facing elevation shall be distinct from the street-facing elevations of other buildings within the same development.

17. Windows. The Applicant's submittal does not contain elevation drawings. Therefore, its complance with the Windows aspect of the City's retail/commercial building standards is unclear:

OCMC 17.62.055 – Institutional, office, multi-family, retail, and commercial building standards.

J. Windows.

1. The minimum windows requirements are set forth in Table 17.62.055.J. Windows are measured in lineal fashion between 3.5 feet and six feet from the ground. For example, a one hundred-foot long building elevation would be required to have at least sixty feet (sixty percent of one hundred feet) of windows in length between the height of 3.5 feet and six feet from the ground.

Table 17.62.055.J
Minimum Windows

Use	*Ground Floor: Front and Street Facing Facades*	*Upper Floor(s): Front and Street Facing Facades*	*Ground Floor: Side(s) Facades*	*Upper Floor(s): Side(s) Facades*
Non-Multi-Family (or Portions of Buildings Thereof)	*60%*	*10%*	*30%*	*10%*
Multi-Family (or Portions of Buildings Thereof)	*15%*	*15%*	*10%*	*10%*

2. Reflective, glazed, mirrored or tinted glass is limited to ten percent of the lineal footage of windows on the street facing facade. Highly reflective or glare-producing glass with a reflective factor of one-quarter or greater is prohibited on all building facades. Any glazing materials shall have a maximum fifteen percent outside visual light reflectivity value. No exception shall be made for reflective glass styles that appear transparent when internally illuminated.
3. Side walls that face walkways may include false windows and door openings only when actual doors and windows are not feasible because of the nature of the use of the interior use of the building. False windows located within twenty feet of a right-of-way shall be utilized as display windows with a minimum display depth of thirty-six inches.

18. Roof Treatments. The Applicant's submittal does not contain elevation drawings. Therefore, its compliance with the Roof Treatments aspect of the City's retail/commercial building standards is unclear:
OCMC 17.62.055 – Institutional, office, multi-family, retail, and commercial building standards.
K. Roof Treatments. The maximum length of any continuous roofline on a street-facing façade shall be seventy-five feet without a cross gable or change in height of at least two feet.

19. Drive-through facilities. The submitted site plan does not appear to comply with Drive-through facilities standards. Approval of a drive-through located in front of the building would have to go through the **Type III Variance process** (see below).
OCMC 17.62.055 – Institutional, office, multi-family, retail, and commercial building standards.
L. Drive-through facilities shall:
1. Be located at the side or rear of the building.
2. Be designed to maximize queue storage on-site.

20. Transit Streets. The Applicant's submittal does not contain elevation drawings. Therefore, its compliance with the Special Development standards along transit streets aspect of the City's retail/commercial building standards is unclear:
OCMC 17.62.055 – Institutional, office, multi-family, retail, and commercial building standards.
M. Special development standards along transit streets.
1. Purpose. This section is intended to provide direct and convenient pedestrian access to retail, office and institutional buildings from public sidewalks and transit facilities and to promote pedestrian and transit travel to commercial and institutional facilities.
2. Applicability. Except as otherwise provide in this section, the requirements of this section shall apply to the construction of new retail, office and institutional buildings which front on a transit street.
3. Development Standards.
a. All buildings shall have at least one main building entrance oriented towards the transit street. A main building entrance is oriented toward a transit street if it is directly located on the transit street, or if it is linked to the transit street by an on-site pedestrian walkway that does not cross off-street parking or maneuvering areas.

Molalla Ave is a transit street, with bus stops near the subject site. According to the current site plan, the functional primary entrance on Parcel A appears to face the parking lot east of the building and Parcel D appears to face the parking lot north of the building. Therefore, elevation drawings would need to show compliance with 17.62.055.M.3.a, and by orienting the main building entrances toward Molalla Ave.

21. Multi-Family Open Space. The development should conform to multi-family usable open space requirements. No plans have been submitted; therefore, its compliance with open space requirements is unclear.

OCMC 17.62.057 – Multi-family open space requirements.

A. Intent. Creating areas of usable open space that are easily accessed by residents provides focal points for community recreation and interaction and adds to the overall quality of life for residents. Given the environmental and recreational benefits of common open space, it should be integrated purposefully into the overall design of a development and not merely be residual areas left over after buildings and parking lots are sited.

B. Open Space Required. All new multi-family developments in all zones shall provide usable open space.

1. In residential zones, each development shall provide a minimum of one hundred square feet of open space per dwelling unit.

2. In nonresidential, commercial and mixed-use zones, each development shall provide a minimum of fifty square feet of open space per dwelling unit.

3. Required setback areas shall not count toward the open space requirement unless setback areas are incorporated into spaces that meet all other requirements of this section.

4. Required open space areas may be counted towards both the open space requirements and the minimum landscaping requirements in OCMC 17.62.050.A, if the spaces meet the requirements of both sections.

C. Usable Open Space Types.

1.Common open spaces shall be accessible to all residents of the development and include landscaped courtyards, decks, gardens with pathways, children's play areas, common rooftop decks and terraces, and other multipurpose recreational or green spaces. Common open spaces may be used to meet one hundred percent of the usable open space requirement. Design standards:

a. Minimum dimensions for common open space shall be twelve feet with a minimum size of two hundred square feet for developments with twenty units or less, and twenty feet with a minimum size of four hundred square feet for developments with twenty-one or more units.

b. Common open space shall feature a mix of natural and recreational amenities to make the area more functional and enjoyable for a range of users. Sites with twenty units or less shall provide a minimum of two of the following amenities, and sites with twenty-one units or more shall provide a minimum of three of the following amenities and an additional amenity for every twenty units over forty, rounded up.

1. Landscaping areas.

2. Community gardening areas.

3. Large trees expected to reach over eighteen inches dbh at maturity.

4. Seating.

5. Pedestrian-scaled lighting.

6. Hard-surfaced pedestrian paths in addition to those required for internal pedestrian circulation.

7. Paved courtyard or plaza.

8. Gazebos or other decorative shelters.

9. Play structures for children.

10. Sports courts.

11. An alternative amenity as approved by the community development director.

c. Common open space shall be separated from ground level windows, streets, service areas and parking lots with landscaping, low-level fencing, and/or other

treatments as approved by the city that enhance safety and privacy for both the common open space and dwelling units.

d. Common open space shall be accessible from the dwelling units and, as appropriate, from public streets and sidewalks. The space shall be oriented to encourage activity from local residents.

2. Private open space that is not open to all residents includes balconies, patios, and other outdoor multi-purpose recreational or green spaces. It may be used to meet up to fifty percent of the usable open space requirement.

a. Minimum dimensions for private open space shall be five feet with a minimum size of forty square feet.

3. Indoor recreational space may be used to meet up to twenty-five percent of the usable open space requirement provided the space is:

a. Accessible to all dwelling units.

b. Designed for and includes equipment for a recreational use (e.g., exercise, group functions, etc.).

Conditional Use Permit:

A Conditional Use Permit is required to approve the development of drive-through facilities in the subject site's Mixed-Use Corridor 2 (MUC-2) zoning pursuant to *OCMC 17.29.030.A*.

Conditional Use applications are processed as **Type III Land Use Applications**. Once an application is submitted, it is reviewed for completeness purposes within 30 days. Upon a complete application submittal, the applicant is entitled to notification from the City for a decision of approval, approval with conditions, or denial, within 120 days of deeming the application complete, by state law. Type III decisions include a staff recommendation and a decision by the Planning Commission, with appeal on the record to the City Commission, and then onto LUBA.

Conditional Use Permits and Processes are governed by *OCMC 17.56 – Conditional Uses*, and the Applicant shall provide all applicable information required in its **Permit – Authorization – Standards – Conditions** (*OCMC 17.56.010*) and **Permit – Application** (*OCMC 17.56.020*) sections:
Submitted plans should conform to the standards noted in *OCMC 17.56.010,* as well as the Code's **Criteria and standards for conditional uses** (*OCMC 17.56.040*).

OCMC 17.56.010 - Permit—Authorization—Standards—Conditions.
A. Conditional uses, because of their public convenience and necessity and their effect upon the neighborhood shall be permitted only upon the approval of the planning commission or city commission after due notice and public hearing, according to procedure as provided in OCMC 17.50. The applicant shall provide evidence substantiating that all the requirements of this title relative to the proposed use are satisfied, and demonstrate that the proposed use also satisfies the following criteria:
1. The use is listed as a conditional use in the underlying district;
2. The characteristics of the site are suitable for the proposed use considering size, shape, location, topography, existence of improvements and natural features;
3. Development shall demonstrate compliance with OCMC 16.12;
4. The proposed use will not alter the character of the surrounding area in a manner which substantially limits, impairs or precludes the use of surrounding properties for the primary uses listed in the underlying district;
5. The proposal satisfies the goals and policies of the city comprehensive plan which apply to the proposed use.

B. Permits for conditional uses shall stipulate restrictions or conditions which may include, but are not limited to, a definite time limit to meet such conditions, provisions for a front, side or rear yard greater than the minimum dimensional standards of the zoning ordinance, suitable landscaping, off-street parking, and any other reasonable restriction, condition or safeguard that would uphold the spirit and intent of the zoning ordinance, and mitigate adverse effect upon the neighborhood properties by reason of the use, extension, construction or alteration allowed as set forth in the findings of the planning commission.
C. Any conditional use shall meet the dimensional standards of the zone in which it is to be located pursuant to subsection B of this section unless otherwise indicated, as well as the minimum conditions listed below.
D. In the case of a use existing prior to the effective date of the ordinance codified in this title and classified in this title as a conditional use, any change of use expansion of lot area or expansion of structure shall conform with the requirements for conditional use.
E. The planning commission may specifically permit, upon approval of a conditional use, further expansion to a specified maximum designated by the planning commission without the need to return for additional review.

OCMC 17.56.040 – Criteria and standards for conditional uses

In addition to the standards listed herein in OCMC 17.56.010, which are to be considered in the approval of all conditional uses and the standards of the zone in which the conditional use is located, the following additional standards shall be applicable:

> ***A. Building Openings.*** *The city may limit or prohibit building openings within fifty feet of residential property in a residential zone if the openings will cause glare, excessive noise or excessive traffic which would adversely affect adjacent residential property as set forth in the findings of the planning commission.*
>
> ***B. Additional Street Right-of-Way.*** *The dedication of additional right-of-way may be required where the city plan indicates need for increased width and where the street is inadequate for its use; or where the nature of the proposed development warrants increased street width.*

Variances:

Based on the Applicant's site plan submission, the proposal appears to require two variances. They relate to:

1. Variance from drive-through facility standards in *OCMC 17.62.055.L* that require the drive aisle to be located at the side or rear of the building and be designed to maximize queue storage on-site. The current site plan indicates the drive aisles are along the street frontages. Along with a variance from General Standard OCMC 17.62.050.C.1. *Pathways between the street and buildings fronting on the street shall be direct and not cross a drive aisle.*
2. Variance from General Standard OCMC 17.62.050.B.1. *Parking areas shall be located behind the building façade that is closest to the street, below buildings, or on one or both sides of buildings.*

Staff cannot recommend approval of variances 1, and 2 since they do not appear to meet the intent of the site plan and design standards, although the applicant may still apply for them. The nature and extent of these Variances are beyond the scope of what can be considered a Minor Variance (*OCMC 17.60.020.D and OCMC 17.60.020.E*) and are therefore both Major Variances and subject to a Type III Variance process. As a result, according to procedures set forth in *OCMC 17.60.030*, the planning commission may authorize variances. In granting a variance, the planning commission may attach conditions to protect the best interests of the surrounding property or neighborhood and otherwise achieve the purposes of this title. No variances shall be granted to allow the use of property for a purpose not authorized within the zone in which the proposed use would be located (*OCMC 17.60.010*).

The procedures for the Variance process are outlined in the Code as follows:

Variances may be granted on the following grounds, pursuant to the Applicant's establishment that these grounds are satisfied through their submissions:

OCMC 17.60.030 – Variances – Grounds

A. That the variance from the requirements is not likely to cause substantial damage to adjacent properties by reducing light, air, safe access or other desirable or necessary qualities otherwise protected by this title;

B. That the request is the minimum variance that would alleviate the hardship;

C. Granting the variance will equal or exceed the purpose of the regulation to be modified.

D. Any impacts resulting from the adjustment are mitigated;

E. No practical alternatives have been identified which would accomplish the same purpose and not require a variance; and

F. The variance conforms to the comprehensive plan and the intent of the ordinance being varied.

Since elevation drawings were not provided for review, additional Variances may be required if future elevation drawings do not conform to the codes outlined above.

Planning Commission Adjustment of Parking Standards:

- A Planning Commission adjustment of parking standards is required if the applicant is requesting more than the maximum number of permitted parking stalls.
- Approval Criteria for Parking Adjustments
    - Documentation: The applicant shall document that the individual project will require an amount of parking that is different from that required after all applicable reductions have been taken.
        - The documentation should demonstrate that alternative measures, such as transportation demand management strategies that have been explored as an alternative to requesting additional parking (transit, carpooling, incentives for employees or customers to utilize alternative transportation modes). The applicant may contact Trimet for more information on their commuter benefit and/or transit pass program at RhodesDo@trimet.org.
    - Parking analysis for surrounding uses and on-street parking availability: The applicant must show that there is a continued fifteen percent parking vacancy in the area adjacent to the use during peak parking periods and that the applicant has permission to occupy this area to serve the use pursuant to the procedures set forth by the community development director.
        - For the purposes of demonstrating the availability of on street parking as defined in [Section] 17.52.020.B.3., the applicant shall undertake a parking study during time periods specified by the community development director. The time periods shall include those during which the highest parking demand is anticipated by the proposed use. Multiple observations during multiple days shall be required. Distances are to be calculated as traversed by a pedestrian that utilizes sidewalks and legal crosswalks or an alternative manner as accepted by the community development director.
            - Minimum of five days (weekends and weekdays)
            - Two hour increments during hours of operation
        - The onsite parking requirements may be reduced based on the parking vacancy identified in the parking study.
    - Function and Use of Site: The applicant shall demonstrate that modifying the amount of required parking spaces will not significantly impact the use or function of the site and/or adjacent sites.
    - Compatibility: The proposal is compatible with the character, scale and existing or planned uses of the surrounding neighborhood.

- Safety: The proposal does not significantly impact the safety of adjacent properties and rights-of-way.
- Services: The proposal will not create a significant impact to public services, including fire and emergency services.

Transportation Impacts:
The applicant will need to have a traffic engineer conduct a transportation study in conformance with the City's Guidelines for Transportation Impact Analyses available on the Oregon City website. See DKS notes for more details.

Tree Protection/Mitigation and Street Trees
Tree removal during the land development process is subject to compliance with tree protection and mitigation standards.

- Street trees are subject to OCMC Chapter 12.08. A street tree plan demonstrating compliance with OCMC 12.08 is required
- The applicant's submittal should identify species and size of all existing trees greater than 6" DBH onsite.
- Tree removal is subject to OCMC Chapter 17.41
- Tree protection standards can be found in OCMC Section 17.41.130

A mitigation plan prepared by a qualified professional is required in accordance with OCMC Chapter 17.41.

Alternative option: **Master Plans and Planned Unit Developments**
OCMC 17.65.010 – Purpose and Intent - It is the intent of this chapter to foster the growth of major institutions, phased residential, commercial or mixed-use development, and other large-scale development, while identifying and mitigating the impacts of such growth on surrounding properties and public infrastructure. The city recognizes the valuable housing options, services and/or employment opportunities that these developments bring to Oregon City residents. The master plan or planned unit development process is intended to facilitate an efficient and flexible review process for major developments, support innovative and creative land development, and to provide long-term assurance to plan for and execute developments in a phased manner. To facilitate this, the master plan process is structured to allow an applicant to address larger development issues, such as adequacy of infrastructure and transportation capacity, and reserve capacity of the infrastructure and transportation system before expenditure of final design costs. The master plan or planned unit development process is further intended to promote efficiency in land development, maintenance, street systems and utility networks while providing site layouts that integrate usable and attractive open spaces, site circulation, and the general wellbeing of site users. For the purposes of this chapter planned unit developments are considered the same as master plans.

OCMC 17.65.030 – Applicability of the master plan or planned unit development regulations.

D. Voluntarily. An applicant may voluntarily submit a master plan or planned unit development as part of a land use review, including for residential projects.

Master planning is a Type III land use application, and it allows an applicant both flexibility and predictability to do various things, including:

- Vest the current version of the development code at the time of application.
- Phase development of large sites with multiple tenants up to 20 years.
- Propose mitigation and infrastructure for land use impacts in phases over the term of the master plan.
- Request adjustments to development standards, similar to a variance
- The applicant may wish to further discuss the master plan review process with Planning staff at a separate meeting which we can set up via Zoom.

Other notes:
A neighborhood association meeting is required for Type III applications. The proposed development is within the Hillendale Neighborhood Association.

Please include the Citizen Involvement Chiefs Liaison, Josh Kayser, in any Neighborhood Association meeting requests, notifications or correspondence. Josh can be reached at ncecowboy1@gmail.com. Land Use Chair, William Gifford can be reached at william@smallflags.com.

Your application was transmitted to the State Historic Preservation Office (SHPO) and affected tribes for review. Comments received will be provided to the applicant.

Renderings are highly encouraged when applications will be reviewed by the Planning Commission.

We encourage a diversity of tree species throughout your development.

The 2025 Planning applications and fees include:

- **Site Plan and Design Review:**

Construction Cost	Application Fee
Less than $500,000	$2,855 plus 0.007 x project cost
$500,000 to $3,000,000	$4,743 plus 0.005 x project cost
Over $3,000,000	$16,082 plus 0.003 x project cost
Maximum fee	$75,337

- **Conditional Use Permit:** $5,218
- **Type III Parking Adjustment:** $1,322
- **Type III Variance**, Building Lot Frontage: $3,443
- **Type III Variance**, Front Yard/Corner Lot Side Setback: $3,443
- **Incomplete Applications**: No charge for first incomplete submittal, $381 for each incomplete submittal thereafter
- **Re-Notice Application**: $794

Please review the 2025 fee schedule.

Applications, Checklists, and Links

- Type III Review Process
- Variance Application
- Conditional Use Permit Application
- Conditional Use Checklist
- Land Use Application
- Site Plan and Design Review Construction Cost Form
- Site Plan and Design Review Checklist
- Oregon City Adopted Tree List
- Oregon City Municipal Code

Planning Division
Melissa Lopez, Assistant Planner with the Oregon City Planning Division, reviewed your pre-application submittal for the Planning Division. Jude may be reached at 503.496.1543 or mlopez@orcity.org.

Development Services Division (Utilities/Public Improvements/SDC's etc):

Erik Nichols, Projects Engineer with the Oregon City Development Services Division reviewed your pre-application submittal for the Development Services Division. Josh may be reached at 503.204.4631 or enichols@orcity.org.

Building Division:
Your application was transmitted to our Building Official. You may contact Jim Sayers, Building Official, at 503.496.1517 or jsayers@orcity.org if you have any building related questions.

Clackamas County Fire:
Your application was transmitted to Mike Boumann, Lieutenant Deputy Fire Marshal of Clackamas County Fire District #1. Notes were submitted for this application. You may contact Mr. Boumann at 503.742.2660 or at mike.boumann@ClackamasFire.com .

Oregon City Municipal Code Criteria:
The following chapters of the Oregon City Municipal Code (OCMC) may be applicable to this proposal:
OCMC 12.04 – Streets, Sidewalks and Public Places
OCMC 12.08 – Public and Street Trees
OCMC 13.12 – Stormwater Management
OCMC 15.48 – Grading, Filling and Excavating
OCMC 17.29 – "MUC" Mixed Use Corridor District
OCMC 17.41 – Tree Protection Standards
OCMC 17.47 – Erosion and Sediment Control
OCMC 17.50 – Administrative Processes
OCMC 17.52 – Off-Street Parking and Loading
OCMC 17.56 – Conditional Use
OCMC 17.60 – Variance Procedures & Criteria
OCMC 17.62 – Site Plan and Design Review
OCMC 17.65 – Master Plans and Planned Unit Developments

Public Disclosure:
The purpose of a pre-application meeting is to introduce the impacts, limitations, requirements, approval standards, fees and other information that may affect the proposal (City Code 17.50.050). Omissions or failures by staff to identify all relevant applicable land use requirements or how they might affect a proposal may occur, either as a result of a limited pre-application submittal or the consideration of discretionary criteria.

All pre-application conference related communications, including these notes, are informational only. They do not substitute for a public hearing and no land use decision is rendered at this phase. Notwithstanding any representations by City staff at a preapplication conference, staff is not authorized to waive any requirements of the Oregon City Municipal Code, and any omission or failure by staff to recite to an applicant all relevant applicable land use requirements shall not constitute a waiver by the City of any standard or requirement.

Pre-application conferences are required by Section 17.50.050 of the City Code, as follows:

A. *Preapplication Conference. Prior to submitting an application for any form of permit, the applicant shall schedule and attend a preapplication conference with City staff to discuss the proposal. To schedule a preapplication conference, the applicant shall contact the Planning Division, submit the required materials, and pay the appropriate conference fee. At a minimum, an applicant should submit a short narrative describing the proposal and a proposed site plan, drawn to a scale acceptable to the City, which identifies the proposed land uses, traffic circulation, and public rights-of-way and all other*

required plans. The purpose of the preapplication conference is to provide an opportunity for staff to provide the applicant with information on the likely impacts, limitations, requirements, approval standards, fees and other information that may affect the proposal. The Planning Division shall provide the applicant(s) with the identity and contact persons for all affected neighborhood associations as well as a written summary of the preapplication conference. Notwithstanding any representations by City staff at a preapplication conference, staff is not authorized to waive any requirements of this code, and any omission or failure by staff to recite to an applicant all relevant applicable land use requirements shall not constitute a waiver by the City of any standard or requirement.

B. *A preapplication conference shall be valid for a period of six months from the date it is held. If no application is filed within six months of the conference or meeting, the applicant must schedule and attend another conference before the City will accept a permit application. The community development director may waive the preapplication requirement if, in the Director's opinion, the development does not warrant this step. In no case shall a preapplication conference be valid for more than one year.*

Ph (503) 657-0891

DEVELOPMENT SERVICES
PRE-APPLICATION MEETING NOTES

Planning Project Number:	PA 25-016
Address:	1367 Molalla Ave
Map Number(s):	3-2E-05DB
Tax Lot(s):	3200, 3201, 3300, and 3400
Project Name:	Multi Lot development with Fast Food
Meeting Date:	April 21, 2025
Reviewer(s):	Erik Nichols | enichols@orcity.org | 971-204-4631

Public Disclosure:
The information provided shows the possible impacts, limitations, requirements, approval standards, fees and other information that may affect the proposal (City Code 17.50.050). Omissions or failures by staff to recite all relevant applicable land use requirements to an applicant may occur, either as a result of a limited pre-application submittal or staff's interpretation of the codes at that time.

All pre-application conference related communications, including these notes, are informational only. They do not substitute for a public hearing and no land use decision is rendered at the pre-application conference. Notwithstanding any representations by City staff at a preapplication conference, staff is not authorized to waive any requirements of the Oregon City Municipal Code, and any omission or failure by staff to recite all relevant or applicable land use requirements shall not constitute a waiver by the City of any standard or requirement.

The Development Process: https://www.orcity.org/1105/Land-Use

Land Use	Permitting	Construction
Pre-Application	**Application**	**Bonding**
Completeness	**City Review**	**Shop Drawing Approval**
Public Notice/Comment	**Consultant Revision**	**Onsite Specific PreCon Mtgs**
Staff Report	**Continued back and forth**	**Onsite Specific Inspections**
Issuance	**Issuance**	**Testing**
Appeal	**Pre-Construction Meeting**	**Closeout**

General Comments

1. A complete land use application will typically include a preliminary stormwater report and preliminary construction plans showing all required improvements (E.G., roads, sidewalks, sewer, water, stormwater facilities, grading, and erosion control). The application should also include a

narrative responding to all sections of the Oregon City Municipal Code (OCMC) applicable to the proposed development. See provided checklists at https://www.orcity.org/1065/Engineering-Development-Services-Checkli

2. The City will issue a Staff Report in response to the contents of the application package provided by the applicant. Once a Staff Report is issued, staff strongly encourages a pre-design meeting with the project engineer to discuss plan requirements, conditions of approval, and process.

3. Conditions of approval contained in the Staff Report will dictate what is needed after the land use decision is issued (providing the appropriate documents E.G., construction plans, reports, etc.).

4. All applicable System Development Charges (SDC) shall be due and payable upon building permit issuance unless deferment is requested, and a financing agreement is executed. The applicant will need to complete a SDC request form, found on the City's website. https://www.orcity.org/868/System-Development-Charges-SDCs

   SDC credits, reductions, and reimbursements are solely determined by the Director of Public Works and shall follow the process listed in City Code 13.20.040 and 13.20.050.

5. The applicant may be required to sign a Non-Remonstrance Agreement for the purpose of making sanitary sewer, storm sewer, water or street improvements in the future that benefit the property and assessing the cost to benefited properties.

6. The contractor for the applicant will be required to attend a pre-construction meeting prior to any work beginning onsite.

7. All public improvements must be bonded with a 120% performance guarantee prior to the beginning of construction. Public improvements are defined as public utility extensions and roadway improvements within existing right-of-way. Public improvements may also be on private property in certain circumstances. This bond is released at the end of the construction period assuming everything is constructed as agreed upon.

8. All newly constructed public improvements shall be maintained for a two-year period following their acceptance of construction with a 15% maintenance guarantee. Newly constructed public improvements consist of those improvements within existing right of way and those that were constructed on private land to be deeded for City ownership following approval of a plat. This bond is released at the end of the maintenance period (typically 2 years).

9. PLEASE NOTE: A property is NOT allowed to plat until all public improvements have been completed to the satisfaction of the City.

10. PLEASE NOTE: A project will NOT be recommended for occupancy by Public Works to the Building Division until all public improvements are accepted by the Public Works Department.

11. PLEASE NOTE: Once the land use decision is made, permits need to be sought to be able to start construction. This process may take many months after the land use decision is made. The applicant will need to submit separately to Public Works/Engineering and Building.

12. PLEASE NOTE: **All** permits from Public Works, including an erosion control permit, must be obtained prior to any work beginning on the site and in the right-of-way (ROW).

Streets

1. Molalla Avenue is functionally classified as a "Major Arterial" road and the development property is zoned "MUC-2". The following tables show the existing road section and the maximum street section required by city code for this type of road.

Existing Street Section on the development's side of centerline on Molalla Ave

Road Classification	Zoning	R.O.W. width	Road Width	Public Access	Sidewalk	Landscape Strip & Curb	Bike Lane	Street parking	Travel Lanes	Median
Major Arterial	Mixed Use	45'	28'	1'	5'	0.5'	0'	None	(2) 11'	7.5'

Maximum Street Section city code may require on the development's side of centerline on Molalla

Road Classification	Zoning	R.O.W. width	Road Width	Public Access	Sidewalk	Landscape Strip & Curb	Bike Lane	Street parking	Travel Lanes	½ of a Median
Major Arterial/Molalla Ave Corridor	Mixed Use	51	22'	0.5'	10'	0.5' (5'x5' tree wells within sidewalk)	5'	8'	(2) 11'	6'

10' 1.d req'd

pkg not req'd

2. The proposal provided with the pre-application submittal has not conceptually provided the required street improvements.

3. Improvements along the frontage shall be in conformance to the Molalla Avenue Boulevard and Bikeway Improvement Plan. The improvements from the development's side to the road's centerline shall include 45 ft. of ROW, half of the 12 ft. median/turn lane, (2) 11 ft. travel lanes, 5 ft. bike lane, and a 10 ft. sidewalk. An 8 ft. parking aisle will not be required along the Molalla Ave frontage.

4. The development also fronts along Beavercreek Way which is classified as a "local" street. No frontage improvements are expected to be required on this street.

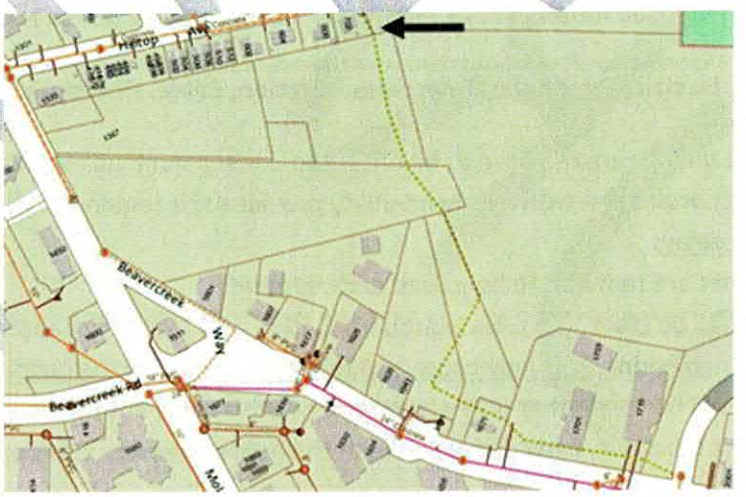
5. Additional information and coordination will be necessary for the Beavercreek Road secondary access route (i.e. easements, property ownership, utility use, etc.). The developer shall coordinate their road design with the City's Beavercreek Road Access Management Plan.

6. A traffic report will be necessary for this development to determine the impact on Molalla Ave and Beavercreek Road. Traffic signal modification will be necessary at these access points.

7. The development proposes to install a local road from Molalla Avenue to the southeast corner of the property. The City's local road standard dimensions for mixed use are noted below (OCMC 16.12.016):

Maximum Street Section city code may require on the development's side of centerline on Molalla

Road Classification	Zoning	R.O.W. width	Road Width	Public Access	Sidewalk	Landscape Strip & Curb	Bike Lane	Street parking	Travel Lanes	½ of a Median
Local	Mixed Use	62'	40'	0.5'	10.5 ft. sidewalk including 5ft x 5ft Tree wells	NA	8'	(2) 12'	NA	Local



8. It should be noted that street parking is identified in the City's Code as part of the mixed use local road cross-section. These parking spaces within the development may count towards the site's parking counts.

9. The secondary access that is within the neighboring property easement would require the same right-of-way dimensions (62 ft) as the local road connection (Mixed Use Local Road) but would not be required to provide space for parking. A modification request to the City's code would be needed during the land use application process. The existing commercial/industrial developments around the access would most likely not require additional or overflow parking that is typically seen in a more residential environment or areas where parking is limited. This would reduce the pavement cross-section within the easement.

10. A portion of the local road running through the property (roughly parallel to Molalla Avenue) is shown to provide 54 ft. of right of way which is less than the 62 ft. standard for a local road within a mixed use area. The Applicant has proposed to remove parking from one side of the standard street cross section in this area. This would be acceptable, however deviation from the City's standard requires a modification request to the City's code (See item 17 below).

11. The Beavercreek-Hilltop shared use path (Transportation System Plan, Project S28) is identified to be constructed in this area. Coordination with the City will be needed during the Site Plan Review process to identify how S28 will be incorporated into the site. Shared use paths are intended for regional connectivity within the City for bicyclists and pedestrians to easily move through the City and not to be used in place of a local sidewalk.

TSP Project S28

12. Tree plantings along the frontage shall be in conformance with the Molalla Ave Boulevard and Bikeway Improvement Plan. Trees shall be planted at intervals of 25-35 feet and at 30 ft away from intersections to maintain sight distance.

13. Fire truck turn-around must meet the requirements of and be approved by Clackamas County Fire District No.1.

14. The development will be required to provide a 10-foot-wide Public Utility Easement (PUE) along all property lines fronting existing or proposed ROW.

15. Street lighting will be in conformance to the Molalla Ave Boulevard and Bikeway Improvements Plan. Special lighting requirements will be required. The applicant shall submit a photometric plan and include additional streetlights, as required, or show that the existing streetlighting meets standards from the Illuminating Engineering Society of North America (IESNA) ANSI RP-8-14 Roadway Lighting book. The materials for new streetlights must be from the latest PGE approved material list. For energizing of streetlights and to obtain the latest PGE approved material list, contact the following PGE Outdoor Lighting Services Department Design Project Manager.

    Jeff Wiese
    (503) 742-8363
    Jeff.wiese@pgn.com

16. **Any deviations from standards required within Table 16.12.016 of the Oregon City Municipal Code, such as elimination of typical street components, or reduction to the size of these components (drive lanes, sidewalks, bike lanes, landscaping, ROW dedication, etc.), requires a written request through the modification process outlined in Section 16.12.013 of the Oregon City Municipal Code. Proposed modifications may require additional evidence and analysis for review.**

Private Utilities (Gas, Electric, Telephone, Telecommunication, Cable, Fiberoptic, Etc.)

1. Existing overhead utilities are required to be relocated underground unless deemed infeasible by utility providers (coordination with overhead utility provider(s) is required). This may be costly and create significant delays.
2. All new service lines are required to be placed underground.
3. All new utilities shall be placed on private property within a 10 foot utility easement or other area as agreed upon by Engineering. This may cause a shift in the location of the building footprint.
4. The applicant should be aware that utility coordination with these entities can be costly and substantially affect timelines. Early discussion with the utility company is imperative for a timely project. The City does not provide coordination with these utilities. Staff may provide suggestions or guidance for utility locations such as relocation of poles, but the design is ultimately up to the applicant's consultant and the private utility. However, the city must approve the design.

Stormwater

1. The Oregon City Stormwater and Grading Design Standards can be found online at: https://www.orcity.org/1227/Stormwater-Grading-Design-Standards

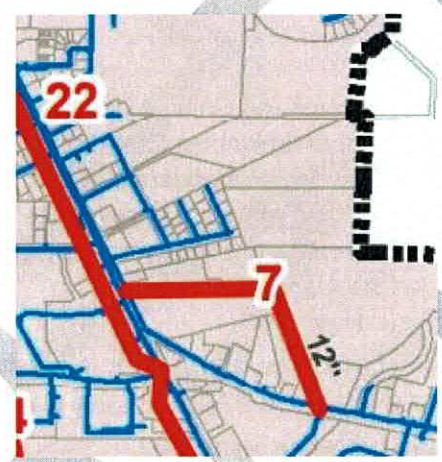
2. Projects within the General Thresholds (Section 1.2.1) of the Stormwater and Grading Design Standard are subject to the requirements of the City's Stormwater and Grading Design Standards. The project, as described in the Pre-Application submittal, appears to trigger Part A (see below) of the General Thresholds.
   A. Development activities that result in 5,000 square feet of new or replaced impervious surface, cumulative over a 5-year period.

   New or replaced impervious surface, includes surfaces associated with required frontage improvements.

3. Where compliance with the Stormwater and Grading Design Standards is required, applicants must submit a completed Site Assessment and Planning Checklist (and other items as described in Section 9.1.1 of the Stormwater and Grading Design Standards) as part of the land use application review process. At a minimum, to receive Completeness Approval, the applicant should submit a preliminary stormwater report addressing the following items from Section 9.1.1 of the City's Stormwater and Grading Design Standards.
   A. Stormwater management strategy
   B. A site plan showing an adequately sized stormwater facility based on Stormwater Best Management Practices (BMP) Sizing Tool or sized using the Engineered Method (as defined by City's Stormwater and Grading Design Standards).
   C. A geotechnical report or a Natural Resource Conservation Service (NRCS) soils report documenting onsite infiltration and soil conditions in support of a proposed stormwater management strategy.
   D. Downstream analysis which extends to the distance where the project site contributes less than 15 percent of the cumulative tributary drainage area or 1,500 feet downstream of the approved point of discharge, whichever is greater, as required by Chapter 5 of the Stormwater and Grading Design Standards.

4. The proposal provided with the pre-application submittal has not conceptually provided the required stormwater improvements. The number of lots may need to be reduced. The size of the development may need to be reduced to accommodate stormwater requirements.

5. The nearest downstream public stormwater facility is an inlet located along Molalla Ave in front of the proposed development. This structure directs flows through a 12-inch main.



6. The development may be required to extend a 12" stormwater line to the frontage of the proposed development for conveyance of stormwater to the nearest public stormwater system.

7. The Applicant will need to provide proposed irrigation improvements during the site plan review process.

Water

1. There is an existing 16-inch steel water main that runs on the easterly side of Molalla Ave and an 8"cast iron main located on the westerly side Molalla Ave.

2. 2. The City's Water Master Plan identifies two CIP projects located within the limits of the proposed development

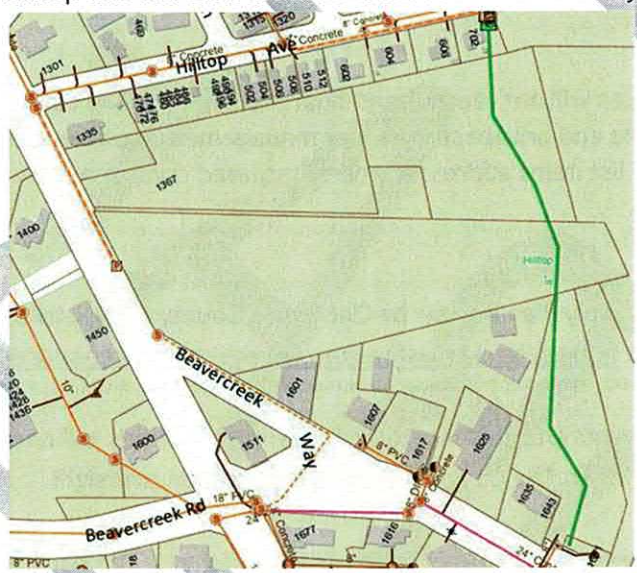
City to build this

a. CIP Project #22 in the City's Water Master Plan identifies a new 18"/24" transmission main within Molalla Ave to increase transmission to the Henrici Reservoir. This project is currently under construction by the City.

b. CIP Project #7 in the City's Water Master Plan identifies a 12" water main running through the proposed development to loop water between Molalla Ave and Beavercreek Road.

Coordination with the City will be needed on how the proposed development will impact these CIP projects and how the development will obtain water to their site. Public utility easements will be required. The City may require the Applicant to incorporate portions Project #7 as part of the development's design. Depending on the scheduling of the development and the construction of the CIP projects, a fee-in-lieu proportionate to the length of water main within the property or along the site's frontage may be required.

3. There is an existing fire hydrant located on Molalla Ave off of the existing 8" CI. Additional hydrants may be required within the development.



4. New fire hydrants shall be located per the requirements and direction of Clackamas Fire District No. 1.

5. The proposal provided with the pre-application submittal has not conceptually provided the required water infrastructure improvements.

Sanitary Sewer

1. A sanitary sewer force main exists within Molalla Ave along the sites frontage, and discharges to the 15" gravity system and manhole to the north on Hilltop Ave.

2. They City's Sewer Master Plan identifies an 8" gravity sewer main running within the proposed development between Hilltop Ave and Beavercreek Road as a future CIP Project.

As with the CIP water main projects above, coordination with the City will be needed on how the development will impact this future project. A Public Utility Easement will be required.

3. The Applicant will be required to provide sewer utility information on how the development will connect to the City's sewer collection system.

4. The proposal provided with the pre-application submittal has not conceptually provided the required sanitary sewer infrastructure improvements.

Transportation

1. The applicant will need to have a traffic engineer to provide a Transportation Impact Analysis (TIA) in conformance with the City's Guidelines for Transportation Impact Analyses available on the Oregon City website. https://www.orcity.org/1164/Guidelines-for-Transportation-Impact-Ana

The analysis may show offsite improvements such as turn lanes or intersection improvements could be required causing significant delays and increasing costs.

2. Based on the information provided by the applicant, it appears the trip generation level triggers the need to submit a Transportation Impact Study (TIS). For questions regarding the TIA please contact the following:

   Reah Flisakowski, PE
   Direct: 503-972-1203
   Email: rlf@dksassociates.com

*Please note the cost for the City Traffic Engineering consultant's review during the land use process will be charged at or near the time of Land Use Decision. This fee is not reimbursable if land use is denied or if the application does not proceed forward to permit.

Occupancy

8. Development Services will not recommend final occupancy of the building until construction of public improvements and private stormwater management facilities is completed with all construction punch list items addressed and all required documents are provided.

Other

1. Access and Water Supply Plan Review by Clackamas County Fire District No.1 is required. Following instruction found at https://clackamasfire.com/access-and-water-supply-plan-review-submittal/.

2. All public improvements and stormwater management facilities will need inspection by the applicant's civil engineer. The City only provides inspection oversight.

3. Portions of the project resides within Geologic Hazard areas. The applicant will be required to address Chapter 17.44 of the Oregon City Municipal Code (OCMC). The City's geotechnical consultant will review the development for compliance with Chapter 17.44 of the OCMC and review fees shall be borne by the developer. More information can be found at: https://www.orcity.org/1097/Learn-About-the-Geologic-Hazards-Overlay

   The city's Geotechnical Report Review Checklist can be found at the following link: https://www.orcity.org/1065/Engineering-Development-Services-Checkli

Below are notes for the site from the City's geotechnical consultant:

The site is greater than one acre; therefore, a preliminary hydrology report per Section 17.44.50 (11) will be required.

The development standards for sites within a geologic hazard area are outlined in Section 17.44.60 and include requirements related to a number of elements of development, the most notable (but not comprehensive list of) elements for this site include:

- *17.44.060.A Disturbance of existing conditions,*
- *17.44.060.C and D, Design to minimize the volume of cuts and fills, and requirements pertaining to cuts and fills,*
- *17.44.060.F Design of retaining walls,*
- *17.44.060.H and I, Development density per these sections where mapped landslides, slopes over 25 percent, and their buffer zones occur within the parcels, and*
- *17.44.060.L., demonstrate development as proposed will adequately mitigate for potential landslide hazards at the site to prevent future landslides or damage to property and safety.*

Stormwater drainage requirements including a stormwater control plan and limitations on infiltration facilities are detailed in Section 17.44.090.

Contact the City Geotechnical Engineering consultant, Pali Consulting, at tim@pali-consulting.com for all geotechnical engineering coordination.

*Please note the cost for the City Geotechnical Engineering consultant's review during the land use process will be charged at or near the time of Land Use Decision. This fee is not reimbursable if land use is denied or if the application does not proceed forward to permit. The City Geotechnical Engineering consultant's fees during permit review and construction will be charged and due during the permit and inspection phase of the project.

4. The proposed development resides within a high water table area. If the high-water table is part of a larger groundwater system rather than perched water, there may be addition requirements for the design of infiltration stormwater facilities.

FINAL REMINDERS

1. **These notes are the best available based on the submittal and the understanding at the time of pre-application. The notes are NOT a guarantee of requirements.**
2. **Traffic Engineering Fees and Geotechnical Engineering Fees will be due at or near time of Land Use Decision**
3. **The Public Improvements (new roads, road widening, sidewalks, sewer mains, water mains, etc) MUST be completed prior to occupancy.**

4. **Land Use MUST be completed prior to permit. The Land Use Approval is NOT a permit. A separate Building and Engineering Permit Submittal after land use is required when seeking a permit for construction.**
5. **If a project involves a combination of overlay districts, those overlay districts may have requirements different from each other and different from basic zoning. It is recommended significant coordination is completed prior to scheduling any meeting before a public body such as Historic Review Board or Planning Commission.**
6. **SDCs can be a significant cost to the project. It is recommended to seek an estimate prior to proceeding further with an application. There is no cost for an estimate.**
7. **Overhead utility work can cause significant delays to a project. Much of this coordination may need to start 6-12 months prior to construction.**

Supplemental Information:

I. Documentation required before any construction plan review can begin by Public Works (which is after a land use decision has been made):

A. Complete Engineering Plans (Public Improvements, all stormwater facilities, site grading and erosion control)
B. Preliminary Cost Estimate for construction of Public Improvements, all stormwater facilities, site grading and erosion control.
C. Plan Review Fee
D. Complete Storm Water Report and Site Assessment and Planning Checklist
E. Geotechnical Report

II. Documentation required before any construction plan can be deemed approved by Public Works (to be able to start construction or obtain a building permit):

a. Inspection Fee
b. Final Cost Estimate of Public Improvements
c. Approved Engineering Plan stamped and signed by an Oregon Professional Engineer
d. Approved Storm Water Report stamped and signed by an Oregon Professional Engineer
e. DEQ Sanitary Sewer Main Permit
f. NPDES 1200-C Permit
g. 120% Performance Bond
h. Developer/Engineer Agreement
i. Non-Remonstrance Agreement
j. Land Division Compliance Agreement *(for improvements to be provided by home builder such as trees, sidewalks, etc.)*
k. R.O.W. Dedication / Deed of Dedication
l. PGE approved street light plan
m. Fee-in-lieu

n. Indemnity Agreement

III. Documentation required before Public Works will recommend Certificate of Occupancy:

a. Engineer of Record Certificate of Completion
b. Completed Punchlist
c. 15% Warranty Guarantee
d. Recorded Easements
e. Recorded Plat
f. Public storm facilities - 2 Year Maintenance Bond
g. Private storm facilities - Maintenance Covenant and Access Easement

IV. Possible Fees

a. Plan Review Fee
b. Inspection Fee
c. Erosion Control Fee

May 6, 2025 ODOT # 13637

ODOT Pre-Application Response

Project Name: Oregon City Mixed Use	**Applicant:** Cypress Acquisitions, LLC
Jurisdiction: City of Oregon City	**Jurisdiction Case #:** PA-25-016
Site Address: 1367 Molala Ave	

The site of this proposed land use action is in the vicinity of OR 213 interchange. ODOT has permitting authority for this facility and an interest in ensuring that this proposed land use is compatible with its safe and efficient operation.

All ODOT permits and approvals must reach 100% plans before the District Contact signs off on a local jurisdiction building permit or other necessary requirement before construction. **The applicant should contact the District Contact indicated below to determine permit requirements and to obtain application information**.

These comments, standards, and requirements are current as of the date of this letter. If the project scope and/or timeline is modified, the applicant should contact the ODOT Region 1 Development Review program (ODOT_R1_DevRev@odot.oregon.gov) for an updated letter as updated comments may be necessary.

LAND USE PROPOSAL

ODOT attended a pre-application conference held by City of Oregon City to discuss the proposal of two fast food restaurants with drive throughs and an approximately 250-unit multifamily residential development. The proposal also includes a new road connecting to Molalla Avenue and Beavercreek Road.

COMMENTS/FINDINGS

Traffic Impacts

The intersection of OR 213/Beavercreek Road has an adopted Alternative Mobility Target that changes the standard analysis parameters used and/or the time period to which the targets/standards apply. The intersection is expected to meet the alternative mobility target with the Beavercreek Road Concept Plan.

The 2019 Oregon City Beavercreek Analysis states that “a maximum v/c of 1.00 for the first, second and third hours based on an average annual weekday peak hour” “will remain in place for the 2035 planning horizon of the Oregon City TSP”. The analysis also includes construction of a westbound right-turn, merge lane at the Highway 213 / Beavercreek Road intersection (Highway 213 Corridor Alternative Mobility Targets Study).

In addition, the 2022 Courthouse Traffic Impact Analysis (TIA) identified proportional share contributions for planned improvements at the OR 213/Redland Road intersection.

ODOT understands the City will be requiring a TIA for the proposed developments. Therefore, ODOT recommends that once the trip distribution/TIA identifies the trip contribution for both projects above, proportional shares should be required contributing to both projects. Contact the ODOT Traffic Contact identified below and the local jurisdiction to scope the TIA and confirm travel modeling assumptions.

ODOT RECOMMENDED CONDITIONS OF APPROVAL FOR LOCAL JURISDICTION

Traffic Impacts

☒ The applicant shall submit a Traffic Impact Analysis (TIA) to assess the impacts of the proposed use on the State highway system. The analysis must be conducted and stamped by an Oregon-registered Professional Engineer (P.E.). Contact the ODOT Traffic Contact identified below and the local jurisdiction to scope the TIA and confirm travel modeling assumptions. The recommendation for traffic control devices will require either ODOT Region Traffic Engineer (RTE) or State Traffic-Roadway Engineer (STRE) approval and shall be constructed as necessary to be consistent with the ODOT Traffic Manual.

Note: RTE and STRE approval items may take **6 months or longer** to process.

☒ The applicant shall contribute proportional share contributions for the intersection improvements at OR 213/Beavercreek Road.

ADVISORY INFORMATION

Permits and Agreements to Work in State Highway Right of Way

☒ An ODOT Miscellaneous Permit must be obtained for all work in the State highway right of way. When the total value of improvements within the State highway is estimated to be $100,000 or more, a Cooperative Improvement Agreement (CIA) with ODOT is required. A CIA will address the transfer of the improvements to ODOT and any associated technical and administrative costs for projects that meet this improvement threshold. Agreements shall address the work standards that must be followed, maintenance responsibilities, and compliance with ORS 276.071, which includes State of Oregon prevailing wage requirements.

Note: If a CIA is required, it may take **6 months or longer** to process.

Contact the ODOT Development Review Planner identified below for further coordination or questions regarding ODOT comments and requirements during the land use process.

Please send a copy of the Land Use Notice to: ODOT_R1_DevRev@odot.oregon.gov

DETERMINATION OF APPLICATION INCOMPLETENESS

GLUA-25-00025 is Incomplete

CU-25-00001, MAS-25-00001, PARK-25-00001, LL-25-00009, NROD-25-00012, MAS-25-00002

The application has been reviewed and determined to be incomplete. The following items are needed to complete the application:

As very little was submitted for this application, please work with staff as you go through these incomplete items to determine the correct level of detail needed for each item.

1. A completed Land Use Application form or forms with all property owner signatures and complete contact information for the applicant, owner(s), and applicant's representative.
2. A complete and Detailed Narrative Description with Code Responses of the proposed development and an explanation addressing all applicable approval criteria. A Narrative template will be emailed to you for both the Type II and Type III applications upon request.

3 Neighborhood Association meeting:

- A sign-in sheet of the meeting attendees
- A Summary of issues discussed
- A letter from the Neighborhood Association or CIC indicating that a meeting was held.
- If the applicant held a separately noticed meeting, the applicant shall submit a copy of the meeting flyer, a sign sheet of attendees and a summary of issues discussed.

4. Pre-Application Conference Notes from Planning and Development Services. (P/DS)
6. A current Preliminary Title Report or Trio for the subject property(ies). (P)
7. Documentation indicating there are no liens favoring the City for the subject site. Contact Ashley Fraijo aflues@orcity.org for confirmation (P)
8. County Assessor's Office Receipt indicating all taxes for the parcels involved are paid in full for the preceding tax year. (P)

Lot Line Application packet

Per OCMC 17.50.070 Completeness review and one hundred twenty-day rule.

A. Upon submission, the community development director shall date stamp the application form and verify that the appropriate application fee has been submitted. The community development director will then review the application and all information submitted with it and evaluate whether the application is complete enough to process. Within thirty days of receipt of the application, the community development director shall complete this initial review and issue to the applicant a written statement indicating whether

the application is complete enough to process, and if not, what information must be submitted to make the application complete.

B. ***The applicant has one hundred eighty days from the date the application was made to submit the missing information or, on the one hundred eighty-first-day, the application shall be rejected and all materials (except one copy of the application) and the unused portion of the application fe returned to the applicant****. If the applicant submits the requested information within the one hundred eighty-day period, the community development director shall again verify whether the application, as augmented, is complete. Each such review and verification shall follow the procedure in subsection A. of this section.*

The application will be deemed complete for the purpose of this section upon receipt by the community development director of:

1. All the missing information;

2. Some of the missing information and written notice from the applicant that no other information will be provided; or

3. Written notice from the applicant that none of the missing information will be provided.

For assistance regarding your project please contact me in the Community Development Department. I

Follow Up Flag: Follow up
Flag Status: Flagged

Hi Scott,

Not sure if anyone has addressed this but.... Yes, we can add you to the Oct 7th meeting's agenda to make your presentation and field questions from the neighborhood. We meet in the community Development room at 695 Warner Parrott Road (across the parking lot from the Robert Libke Public Safety building) at 6:30.

Let us know if you have any questions.

Sara

> Dear Hillendale Neighborhood Association Leadership –
>
> Cypress Equities would like to discuss their plans for development of the former Walmart property near the northeast corner of Molalla Ave & Beavercreek Rd. I've attached an image showing the site boundary over an aerial photo. Cypress proposes a mixed-use project that includes multi-family use, quick service restaurant, and smaller retail, and requests to be included on your regularly scheduled October 7 quarterly neighborhood meeting. We're finalizing the site layout now and expect to be able to share that with the neighborhood at the meeting. Our team would be prepared to discuss the overall development plan and answer any questions that may come up. Please let me know if there are any issues getting on your October 7 agenda or if you have questions prior to the neighborhood meeting – I can be reached via email or my direct phone line at 971-486-1404.

VERTICAL DATUM IS BASED ON THE CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE ROAD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. GPS STA. LIBRARY 1990".
ELEVATION = 452.739'.

SURVEY MONUMENT PROTECTION

EXISTING SURVEY MONUMENT ARE TO BE PROTECTED DURING CONSTRUCTION OR REPLACED IN ACCORDANCE WITH OREGON REVISED STATUTES 209.140 – 209.155.

GENERAL NOTES

1. ALL WORK AND MATERIALS SHALL COMPLY WITH ALL OREGON CITY REGULATIONS AND CODES AND O.S.H.A. STANDARDS, INCLUDING BUT NOT LIMITED TO THE CURRENT OREGON CITY ROAD DESIGN AND CONSTRUCTION STANDARDS, CLEAN WATER SERVICES DESIGN AND CONSTRUCTION STANDARDS, THE OREGON TRANSPORTATION COMMISSION STANDARDS FOR ACCESSIBLE PARKING DATED AUGUST 2018, AND THE APWA STANDARDS WHICH ARE HEREBY REFERENCED AS PART OF THESE PLANS.

2. THE DESIGN SHOWN IS BASED UPON THE ENGINEER'S UNDERSTANDING OF THE EXISTING CONDITIONS. THE PLAN DOES NOT REPRESENT A DETAILED FIELD SURVEY. THE EXISTING CONDITIONS SHOWN ON THIS PLAN SHEET ARE BASED UPON THE ALTA SURVEY PREPARED BY CES | NW, DATED JULY 9, 2012. THE CONTRACTOR IS RESPONSIBLE FOR VERIFYING FIELD CONDITIONS PRIOR TO BIDDING THE PROPOSED SITEWORK IMPROVEMENTS. IF CONFLICTS ARE DISCOVERED, THE CONTRACTOR SHALL NOTIFY THE OWNER/DEVELOPER PRIOR TO INSTALLATION OF ANY PORTION OF THE SITEWORK WHICH WOULD BE AFFECTED. IF CONTRACTOR DOES NOT ACCEPT EXISTING SURVEY, INCLUDING TOPOGRAPHY AS SHOWN ON THE PLANS, WITHOUT EXCEPTION, HE SHALL HAVE MADE, AT HIS OWN EXPENSE, A TOPOGRAPHIC SURVEY BY A REGISTERED LAND SURVEYOR AND SUBMIT IT TO THE OWNER FOR REVIEW.

3. CAUTION – NOTICE TO CONTRACTOR
THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR ELEVATION OF EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITIES, AND WHERE POSSIBLE, MEASUREMENTS TAKEN IN THE FIELD. THE INFORMATION IS NOT TO BE RELIED ON AS BEING EXACT OR COMPLETE. THE CONTRACTOR MUST CALL THE APPROPRIATE UTILITY COMPANY AT LEAST 48 HOURS BEFORE ANY EXCAVATION TO REQUEST EXACT FIELD LOCATION OF UTILITIES. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO RELOCATE ALL EXISTING UTILITIES WHICH CONFLICT WITH THE PROPOSED IMPROVEMENTS SHOWN ON THE PLANS.

4. IN THE EVENT OF CONFLICTS BETWEEN THE VARIOUS PROVISIONS OF THIS PLAN SET, THE MORE STRINGENT PROVISION APPLY.

5. ATTENTION: OREGON LAW REQUIRES YOU TO FOLLOW RULES ADOPTED BY THE OREGON UTILITY NOTIFICATION CENTER. THOSE RULES ARE SET FORTH IN OAR 952–001–0001 (ADOPTION OF MODEL RULES) THROUGH 952–001–0100 (RECORD KEEPING REQUIREMENTS). YOU MAY OBTAIN COPIES OF THE RULES BY CALLING THE CENTER.
NOTES: THE TELEPHONE NUMBER FOR THE OREGON UTILITY NOTIFICATION CENTER IS (503) 232–1987.

6. A ROAD CLOSURE WILL NO BE PERMITTED WITHOUT A SEPARATE ROAD CLOSURE PERMIT THROUGH WASHINGTON COUNTY TRAFFIC ENGINEERING.

7. THE CONTRACTOR, AT THE TIME OF MEETING WITH COUNTY INSPECTION STAFF FOR A PRE–CONSTRUCTION MEETING, SHALL PROVIDE THEIR WORK TRAFFIC CONTROL PLAN.

8. ACCOMMODATE ALL ROAD USERS AT ALL TIMES INCLUDING MOTORISTS, BICYCLISTS, PEDESTRIANS, AND THOSE WITH DISABILITIES OR IMPAIRMENTS. INSTALL AND MAINTAIN ADDITIONAL TEMPORARY SIGNING AND TRAFFIC CONTROL DEVICES FOR THE CONTROL OF NON–MOTORIZED VEHICLES AND PEDESTRIANS WHERE A REASONABLE VOLUME OF THESE USERS ARE EXPECTED AND WHERE WORK IS EXPECTED TO LAST LONGER THAN ONE HOUR. MAINTAIN SAFE ACCESSIBILITY OR PROVIDE SUITABLE ALTERNATE ROUTES IN, THROUGH, OR AROUND WORK AREAS.

9. ESTABLISH AND MAINTAIN WORK ZONE TRAFFIC CONTROL IN COMPLIANCE WITH THE OREGON TEMPORARY TRAFFIC CONTROL HANDBOOK FOR OPERATIONS OF THREE DAYS OR LESS (DECEMBER 2011) ANY TIME VEHICLE OR PEDESTRIAN TRAFFIC IS INFLUENCED BY THE WORK. FOR WORK REQUIRING DEVICES IN PLACE LONGER THAN THREE (3) DAYS, A SITE SPECIFIC TRAFFIC CONTROL PLAN BASED ON THE PRINCIPLES IN PART 6 OF THE MUTCD, THE OREGON SUPPLEMENT AND ODOT'S 2015 STANDARD DRAWINGS TM800 –TM871, IS REQUIRED. ALL TRAFFIC CONTROL DEVICES SHALL MEET OR EXCEED THE NCHRP 350 REQUIREMENTS FOR CRASHWORTHINESS. COMPLETED SIGNAL SHUT DOWN REQUESTS MUST BE RECEIVED BY THE COUNTY A MINIMUM OF 3 WORKING DAYS PRIOR TO ANY PROPOSED SIGNAL SHUT DOWN.

TOTAL OPEN SPACE PROVIDED	77,608	

REQUIRED OPEN SPACE PER 17.62.057.B.2 = 50 S.F. / DWELLING UNIT. AT 208 UNITS, REQUIRED OPEN SPACE IS 10,400 S.F.

REQUIRED OPEN SPACE PER 17.65.050.C.8.b = 100 S.F. / DWELLING UNIT. AT 208 UNITS, REQUIRED OPEN SPACE IS 20,800 S.F.

PHASING

PHASE 1 – MOLALLA AVENUE IMPROVEMENTS, PROPOSED PUBLIC ROAD (AND ASSOCIATED UTILITIES AND EXTENDING TO BEAVERCREEK ROAD), OVERALL SITE ROUGH GRADING, AND PROPOSED STORMWATER MANAGEMENT FACILITY. PHASE 1 DETAILED DEVELOPMENT PLAN IS SUBMITTED CONCURRENTLY WITH THIS GENERAL DEVELOPMENT PLAN.

PHASE 2 – PARCEL D SITE AND UTILITY IMPROVEMENTS, INCLUDING THE PARCEL D STORMWATER MANAGEMENT FACILITY.

PHASE 3 – PARCEL B SITE AND UTILITY IMPROVEMENTS, INCLUDING EXTENSION OF SANITARY SEWER TO NORTHEAST CORNER OF SITE.

PHASE 4 – PARCEL A SITE AND UTILITY IMPROVEMENTS.

PHASES 2–4 ARE MARKET DRIVEN AND CAN BE CONSTRUCTED CONCURRENTLY OR SEPARATELY WITH OTHER PHASES.

PARCELS A, B, AND D LAYOUTS ARE SHOWN SCHEMATICALLY. PARCELS A, B, AND D WILL EACH SUBMIT THEIR OWN DETAILED DEVELOPMENT PLAN FOLLOWING GENERAL DEVELOPMENT PLAN APPROVAL.

GENERAL DEVELOPMENT PLAN DECISIONS:

1. OVERALL GENERAL DEVELOPMENT PLAN APPROVAL
2. CONDITIONAL USE APPROVAL FOR PARCEL D DRIVE–THROUGH FACILITY
3. MAXIMUM PARKING ADJUSTMENT

SITE DATA

TOTAL SITE AREA: 12.70 AC +/–

PARCEL A AREA: 1.96 AC +/–

PARCEL B AREA: 6.63 AC +/–

PARCEL C AREA: 2.10 AC +/–

PARCEL D AREA: 2.01 AC +/–

NOTE: AREAS SHOWN ARE AFTER PROPOSED ROW DEDICATION.

ALTA/ACSM SURVEY

LOCATED IN THE S.E. 1/4 & S.W. 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, W.M. CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON
REFERENCE: STEWART TITLE PRELIMINARY TITLE REPORT SUPPLEMENTAL NO. 1
ORDER NO. 1016646 DATED APRIL 27, 2012

CERTIFICATION FOR SURVEY

1. THE SURVEY WAS MADE ON THE GROUND DURING APRIL AND MAY OF 2012, AND CORRECTLY SHOWS THE AREA OF THE SUBJECT PROPERTY, THE LOCATION AND TYPE OF ALL BUILDINGS, STRUCTURES AND OTHER IMPROVEMENTS SITUATED ON THE SUBJECT PROPERTY.

2. EXCEPT AS SHOWN ON THE SURVEY, THERE ARE NO OBSERVABLE, ABOVE GROUND ENCROACHMENTS BY THE IMPROVEMENTS ON THE SUBJECT PROPERTY UPON ADJOINING PROPERTIES, STREETS OR ALLEYS, OR BY THE IMPROVEMENTS ON ADJOINING PROPERTIES, STREETS OR ALLEYS UPON THE SUBJECT PROPERTY.

3. THE LOCATION OF EACH EASEMENT, RIGHT OF WAY, SERVITUDE, AND OTHER MATTER AFFECTING THE SUBJECT PROPERTY AND LISTED IN STEWART TITLE COMPANY, PRELIMINARY TITLE REPORT SUPPLEMENTAL NO. 1, ORDER NUMBER 1016646, DATED APRIL 27, 2012, WITH RESPECT TO THE SUBJECT PROPERTY, HAS BEEN SHOWN ON THE SURVEY, TOGETHER WITH THE APPROPRIATE RECORDING REFERENCES, TO THE EXTENT THAT SUCH MATTERS CAN BE LOCATED. THE PROPERTY SHOWN ON THE SURVEY IS THE PROPERTY DESCRIBED IN THAT TITLE REPORT.

4. THE SUBJECT PROPERTY HAS ACCESS TO AND FROM DULY DEDICATED AND ACCEPTED PUBLIC STREETS.

5. THE MEASURED BEARINGS AND DISTANCES SHOWN HEREON FORMS A MATHEMATICALLY CLOSED FIGURE WITH A MINIMUM LATITUDE AND DEPARTURE CLOSURE ERROR OF 1 IN 50,000.

6.THIS SITE LIES WITHIN WITHIN THE LIMITS OF FEMA MAP NUMBER 41005C0279D, WHICH IS NOT PRINTED SINCE THE ENTIRE MAP IS IN ZONE 'X' AS REITERATED ON FEMA MAP NUMBER 41005C1ND0A, EFFECTIVE DATE: JUNE 17, 2008.

7.SUBJECT PROPERTY IS ZONED, MUC-2 "MIXED USE CORRIDOR"

8. NO ORTHOPHOTOGRAPHY, PHOTOGRAMMETRIC MAPPING, LASER SCANNING, OR SIMILAR PRODUCTS WERE UTILIZED IN THE PREPARATION OF THIS SURVEY.

I HEREBY CERTIFY TO PACLAND; WAL-MART STORES, INC., A DELAWARE CORPORATION; WAL-MART REAL ESTATE BUSINESS TRUST, A DELAWARE STATUTORY TRUST; WAL-MART TRS, LLC, A DELAWARE LIMITED LIABILITY COMPANY; STEWART TITLE GUARANTY COMPANY;

THIS IS TO CERTIFY THAT THIS MAP OR PLAT AND THE SURVEY ON WHICH IT IS BASED WERE MADE IN ACCORDANCE WITH THE 2011 "MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/ACSM LAND TITLE SURVEYS", JOINTLY ESTABLISHED AND ADOPTED BY ALTA AND NSPS, AND INCLUDES ITEMS 1-6, 7(a), 7(b)(1), 7(c), 8, 9, 10(a), 11(b), 13, 14, 15-19, 20(a), 21 AND 22 OF TABLE 'A' THEREOF. THE FIELD WORK WAS COMPLETED ON JULY 9, 2012.

CES/NW MAKES NO WARRANTIES AS TO MATTER OF UNWRITTEN TITLE SUCH AS ACQUIESCENCE, ESTOPPEL, ADVERSE POSSESSION, ETC.

RYAN H. GODSEY
PROFESSIONAL LAND SURVEYOR
REGISTRATION NO.(OR) 65604

NARRATIVE

THE BASIS OF BEARINGS IS THE MONUMENTED CENTERLINE OF MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), AS ESTABLISHED BY MONUMENTS NO. 140 AND NO. 139 AS SHOWN HEREON PER SN 2010-176, SURVEY RECORDS, CLACKAMAS COUNTY, OREGON.

THE PURPOSE OF THIS SURVEY IS TO RETRACE THE BOUNDARIES AS SHOWN ON CLACKAMAS COUNTY SURVEY NUMBER SN2004-37. ALL MONUMENTS SHOWN WERE VISITED IN THE PROCESS OF THIS RETRACEMENT.

VERTICAL DATUM IS BASED ON A CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE RD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. GPS STA. LIBRARY 1990" ELEVATION = 452.739'

LEGAL DESCRIPTION PER TITLE REPORT

A TRACT OF LAND SITUATED IN THE SOUTHWEST QUARTER AND THE SOUTHEAST QUARTER OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON, SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOWS:

COMMENCING AT A THREE INCH BRASS DISK SET BY THE OREGON STATE HIGHWAY DEPARTMENT IN THE CENTERLINE OF MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213) AT ENGINEER'S STATION 31+00; THENCE SOUTH 73°27'47" EAST A DISTANCE OF 289.83 FEET TO THE NORTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-010378, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SAID POINT ALSO BEING ON THE SOUTHERLY RIGHT-OF-WAY LINE OF HILLTOP AVENUE; THENCE ALONG THE WESTERLY LINE OF SAID TRACT, SOUTH 27°39'59" EAST A DISTANCE OF 104.03 FEET TO THE SOUTHWEST CORNER OF SAID TRACT, AND BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE NORTHERLY LINE OF THOSE TRACTS DESCRIBED IN FEE NO. 72-08888 AND FEE NO. 69-09411, NORTH 78°20'26" EAST A DISTANCE OF 846.78 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 95-073144 AND FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 67°47'51" EAST A DISTANCE OF 59.75 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 96-010376 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE WESTERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 14°26'42" EAST A DISTANCE OF 407.81 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 96-007471, AND FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE COMMON LINE OF THOSE LANDS DESCRIBED IN FEE NO. 96-046001 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 62.63 FEET; THENCE SOUTH 23°58'58" EAST A DISTANCE OF 133.44 FEET TO THE SOUTHEASTERLY CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE SOUTHERLY LINE OF SAID TRACT, AND ALONG THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 98-044696 AND FEE NO. 99-004122, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°38'35" WEST A DISTANCE OF 125.26 FEET; THENCE ALONG SAID SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, AND THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 95-045260, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°19'45" WEST A DISTANCE OF 45.33 FEET; THENCE ALONG SAID SOUTHERLY LINE, AND THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 92-21067, FEE NO. 97-004501, AND FEE NO. 98-041108, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°29'26" WEST A DISTANCE OF 750.61 FEET TO A POINT IN THE NORTHEASTERLY RIGHT-OF-WAY OF BEAVERCREEK ROAD (MARKET ROAD NO. 11) (COUNTY ROAD NO. 398), SAID POINT BEING 30' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG SAID NORTHEASTERLY RIGHT-OF-WAY, NORTH 59°27'26" WEST A DISTANCE OF 206.63 FEET TO THE COMMON NORTHEASTERLY RIGHT-OF-WAY INTERSECTION OF SAID BEAVERCREEK ROAD AND MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), SAID POINT BEING 35' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE OF MOLALLA AVENUE; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, ALONG THE ARC OF A 5694.58 FOOT RADIUS CURVE TO THE RIGHT A DISTANCE OF 66.39 FEET, THROUGH A CENTRAL ANGLE OF 00°40'05" (THE LONG CHORD OF WHICH BEARS NORTH 27°43'34" WEST A DISTANCE OF 66.39 FEET); THENCE NORTH 27°23'32" WEST A DISTANCE OF 307.30 FEET; THENCE NORTH 62°36'28" EAST A DISTANCE OF 5.00 FEET TO A POINT 40 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE, SAID POINT ALSO BEING ON THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 97-022793, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE LEAVING SAID NORTHEASTERLY RIGHT-OF-WAY LINE, AND CONTINUING ALONG SAID SOUTHERLY TRACT LINE, NORTH 78°20'26" EAST A DISTANCE OF 176.19 FEET TO THE SOUTHEASTERLY CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, NORTH 27°39'59" WEST A DISTANCE OF 73.67 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 560,272 SQUARE FEET, OR 12.862 ACRES, MORE OR LESS.

RECORD DESCRIPTIONS

2004-091249 PARCEL 1
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD, SAID POINT BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 10.28 FEET; THENCE ALONG THE SOUTHERLY LINE THAT TRACT DESCRIBED IN FEE NO. 72-08888 DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 653.92 FEET TO THE SOUTHEAST CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, NORTH 12°38'23" WEST A DISTANCE OF 110.72 FEET TO THE NORTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 81-19662, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, SOUTH 88°29'47" EAST A DISTANCE OF 120.00 FEET TO THE NORTHEAST CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, SOUTH 12°38'23" EAST A DISTANCE OF 120.00 FEET TO A POINT ON THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, NORTH 88°29'47" WEST A DISTANCE OF 771.22 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 19,837 SQUARE FEET, OR 0.455 ACRES, MORE OR LESS.

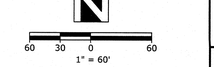
2004-091249 PARCEL 2
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 10.28 FEET TO THE TRUE POINT OF BEGINNING; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 67.85 FEET; THENCE NORTH 62°36'28" EAST A DISTANCE OF 5.00 FEET TO A POINT 40 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE, SAID POINT ALSO BEING ON THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 97-022793, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE LEAVING SAID NORTHEASTERLY RIGHT-OF-WAY LINE, AND CONTINUING ALONG SAID SOUTHERLY LINE, NORTH 78°20'26" EAST A DISTANCE OF 176.19 FEET TO THE SOUTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-010378, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF THOSE TRACTS DESCRIBED IN FEE NO. 72-08888 AND FEE NO. 69-09411, NORTH 78°20'26" EAST A DISTANCE OF 846.78 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 95-073144 AND FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 67°47'51" EAST A DISTANCE OF 59.75 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 96-010376 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE WESTERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 14°26'42" EAST A DISTANCE OF 407.81 FEET TO THE COMMON CORNER OF THOSE TRACTS DESCRIBED IN FEE NO. 69-09411, FEE NO. 96-007471, AND FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT OF LAND DESCRIBED IN FEE NO. 69-09411, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 88°29'47" WEST A DISTANCE OF 322.36 FEET TO THE SOUTHEAST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 81-19662, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE EASTERLY LINE OF SAID TRACT DESCRIBED IN FEE NO. 81-19662, NORTH 1238'23" WEST A DISTANCE OF 120.00 FEET; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, NORTH 8829'47" WEST A DISTANCE OF 120.00 FEET; THENCE ALONG THE WESTERLY LINE OF SAID TRACT, SOUTH 12°38'23" EAST A DISTANCE OF 110.72 FEET TO THE SOUTHEAST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 72-08888, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF SAID TRACT DESCRIBED IN FEE NO. 72-08888, NORTH 8829'47" WEST A DISTANCE OF 653.92 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 256,397 SQUARE FEET, OR 5.886 ACRES, MORE OR LESS.

2004-091251
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD, SAID POINT BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE SOUTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 81-19662, FEE NO. 69-09411, AND FEE NO. 96-007471 DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 1156.21 FEET; THENCE SOUTH 23°58'58" EAST A DISTANCE OF 133.44 FEET TO THE SOUTHEASTERLY CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE SOUTHERLY LINE OF SAID TRACT, AND ALONG THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 98-044696 AND FEE NO. 99-004122, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°38'35" WEST A DISTANCE OF 125.26 FEET; THENCE ALONG SAID SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, AND THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 95-045260, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°19'45" WEST A DISTANCE OF 45.33 FEET; THENCE ALONG SAID SOUTHERLY LINE, AND THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 92-21067, FEE NO. 97-004501, AND FEE NO. 98-041108, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°29'26" WEST A DISTANCE OF 750.61 FEET TO A POINT IN THE NORTHEASTERLY RIGHT-OF-WAY OF BEAVERCREEK ROAD (MARKET ROAD NO. 11) (COUNTY ROAD NO. 398), SAID POINT BEING 30' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG SAID NORTHEASTERLY RIGHT-OF-WAY, NORTH 59°27'26" WEST A DISTANCE OF 206.63 FEET TO THE COMMON NORTHEASTERLY RIGHT-OF-WAY INTERSECTION OF SAID BEAVERCREEK ROAD AND MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), SAID POINT BEING 35' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE OF MOLALLA AVENUE; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, ALONG THE ARC OF A 5694.58 FOOT RADIUS CURVE TO THE RIGHT A DISTANCE OF 66.39 FEET, THROUGH A CENTRAL ANGLE OF 00°40'05" (THE LONG CHORD OF WHICH BEARS NORTH 27°43'34" WEST A DISTANCE OF 66.39 FEET); THENCE NORTH 27°23'32" WEST A DISTANCE OF 229.17 FEET TO THE TRUE POINT OF BEGINNING.



CONTAINING AN AREA OF 284,038 SQUARE FEET, OR 6.521 ACRES, MORE OR LESS.

NOTES

1. THIS SURVEY MAKES NO GUARANTEES THAT THE UNDERGROUND UTILITIES SHOWN ARE ALL THE UTILITIES IN THE AREA. THE UNDERGROUND UTILITIES SHOWN ARE BASED ON LOCATE PAINT MARKINGS IN THE FIELD AND AS-BUILT MAPPING. UTILITIES SHOWN MAY NOT BE IN THE EXACT LOCATION AS NOTED ON THIS SURVEY, BUT ARE LOCATED AS ACCURATELY AS POSSIBLE FROM PAINT MARKINGS ON THE GROUND. IF KNOWN, DEPTHS OF UTILITIES ARE AS SHOWN. THE GAS LINE DEPTHS HAVE NOT BEEN VERIFIED. NORTHWEST NATURAL DESIGN STANDARDS REQUIRE 12" TO 18" OF COVER FOR SERVICE LINES AND 30" TO 36" OF COVER FOR MAIN LINES IN THIS AREA. THE AGE AND CONDITION OF ALL UTILITIES IS UNKNOWN AND CANNOT BE CERTIFIED BY A LAND SURVEYOR. CITY OF OREGON CITY WATER DISTRIBUTION SYSTEM DESIGN STANDARDS REQUIRE A STANDARD MINIMUM COVER OVER BURIED WATER MAINS OF 36" FROM FINISH GRADE. WATERLINE DEPTHS WERE NOT VERIFIED AS A PART OF THIS SURVEY.

2. STORM DRAIN AND SANITARY SEWER LINES SHOWN ARE APPROXIMATE AND BASED ON VISIBLE ABOVE GROUND EVIDENCE AND AS-BUILT MAPS.

3. AS OF THE DATE OF THE SURVEY, A GEOTECHNICAL REPORT WAS NOT RECEIVED, THEREFORE THE CONDITIONS OF ALL DRIVING SURFACES, SHOULDERS, CURBS AND SIDEWALKS (ON-SITE AND ADJACENT ROADS) ARE NOT NOTED.

4. SPOT ELEVATIONS ARE SHOWN AT TOP OF CURB, EDGE OF PAVEMENT AND CENTERLINE OF ROADWAYS.

5. POSTED SPEED LIMIT ON BEAVERCREEK ROAD IS 35 MPH. POSTED SPEED LIMIT ON THE MOLALLA AVENUE IS 35 MPH.

6. VERTICAL DATUM IS BASED ON THE CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE RD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. LOCATED IN THE S.E. 1/4 & S.W. 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, W.M. CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON

VERTICAL BENCHMARK

VERTICAL DATUM IS BASED ON THE CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE ROAD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. GPS STA. LIBRARY 1990".
ELEVATION = 452.739'.

SURVEY MONUMENT PROTECTION

EXISTING SURVEY MONUMENT ARE TO BE PROTECTED DURING CONSTRUCTION OR REPLACED IN ACCORDANCE WITH OREGON REVISED STATUTES 209.140 – 209.155.

GENERAL NOTES

1. ALL WORK AND MATERIALS SHALL COMPLY WITH ALL OREGON CITY REGULATIONS AND CODES AND O.S.H.A. STANDARDS, INCLUDING BUT NOT LIMITED TO THE CURRENT OREGON CITY ROAD DESIGN AND CONSTRUCTION STANDARDS, CLEAN WATER SERVICES DESIGN AND CONSTRUCTION STANDARDS, THE OREGON TRANSPORTATION COMMISSION STANDARDS FOR ACCESSIBLE PARKING DATED AUGUST 2018, AND THE APWA STANDARDS WHICH ARE HEREBY REFERENCED AS PART OF THESE PLANS.

2. THE DESIGN SHOWN IS BASED UPON THE ENGINEER'S UNDERSTANDING OF THE EXISTING CONDITIONS. THE PLAN DOES NOT REPRESENT A DETAILED FIELD SURVEY. THE EXISTING CONDITIONS SHOWN ON THIS PLAN SHEET ARE BASED UPON THE ALTA SURVEY PREPARED BY CES | NW, DATED JULY 9, 2012. THE CONTRACTOR IS RESPONSIBLE FOR VERIFYING FIELD CONDITIONS PRIOR TO BIDDING THE PROPOSED SITEWORK IMPROVEMENTS. IF CONFLICTS ARE DISCOVERED, THE CONTRACTOR SHALL NOTIFY THE OWNER/DEVELOPER PRIOR TO INSTALLATION OF ANY PORTION OF THE SITEWORK WHICH WOULD BE AFFECTED. IF CONTRACTOR DOES NOT ACCEPT EXISTING SURVEY, INCLUDING TOPOGRAPHY AS SHOWN ON THE PLANS, WITHOUT EXCEPTION, HE SHALL HAVE MADE, AT HIS OWN EXPENSE, A TOPOGRAPHIC SURVEY BY A REGISTERED LAND SURVEYOR AND SUBMIT IT TO THE OWNER FOR REVIEW.

3. CAUTION – NOTICE TO CONTRACTOR
THE CONTRACTOR IS SPECIFICALLY CAUTIONED THAT THE LOCATION AND/OR ELEVATION OF EXISTING UTILITIES AS SHOWN ON THESE PLANS IS BASED ON RECORDS OF THE VARIOUS UTILITIES, AND WHERE POSSIBLE, MEASUREMENTS TAKEN IN THE FIELD. THE INFORMATION IS NOT TO BE RELIED ON AS BEING EXACT OR COMPLETE. THE CONTRACTOR MUST CALL THE APPROPRIATE UTILITY COMPANY AT LEAST 48 HOURS BEFORE ANY EXCAVATION TO REQUEST EXACT FIELD LOCATION OF UTILITIES. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO RELOCATE ALL EXISTING UTILITIES WHICH CONFLICT WITH THE PROPOSED IMPROVEMENTS SHOWN ON THE PLANS.

4. IN THE EVENT OF CONFLICTS BETWEEN THE VARIOUS PROVISIONS OF THIS PLAN SET, THE MORE STRINGENT PROVISION APPLY.

5. ATTENTION: OREGON LAW REQUIRES YOU TO FOLLOW RULES ADOPTED BY THE OREGON UTILITY NOTIFICATION CENTER. THOSE RULES ARE SET FORTH IN OAR 952-001-0001 (ADOPTION OF MODEL RULES) THROUGH 952-001-0100 (RECORD KEEPING REQUIREMENTS). YOU MAY OBTAIN COPIES OF THE RULES BY CALLING THE CENTER.
NOTES: THE TELEPHONE NUMBER FOR THE OREGON UTILITY NOTIFICATION CENTER IS (503) 232-1987.

6. A ROAD CLOSURE WILL NO BE PERMITTED WITHOUT A SEPARATE ROAD CLOSURE PERMIT THROUGH WASHINGTON COUNTY TRAFFIC ENGINEERING.

7. THE CONTRACTOR, AT THE TIME OF MEETING WITH COUNTY INSPECTION STAFF FOR A PRE-CONSTRUCTION MEETING, SHALL PROVIDE THEIR WORK TRAFFIC CONTROL PLAN.

8. ACCOMMODATE ALL ROAD USERS AT ALL TIMES INCLUDING MOTORISTS, BICYCLISTS, PEDESTRIANS, AND THOSE WITH DISABILITIES OR IMPAIRMENTS. INSTALL AND MAINTAIN ADDITIONAL TEMPORARY SIGNING AND TRAFFIC CONTROL DEVICES FOR THE CONTROL OF NON-MOTORIZED VEHICLES AND PEDESTRIANS WHERE A REASONABLE VOLUME OF THESE USERS ARE EXPECTED AND WHERE WORK IS EXPECTED TO LAST LONGER THAN ONE HOUR. MAINTAIN SAFE ACCESSIBILITY OR PROVIDE SUITABLE ALTERNATE ROUTES IN, THROUGH, OR AROUND WORK AREAS.

9. ESTABLISH AND MAINTAIN WORK ZONE TRAFFIC CONTROL IN COMPLIANCE WITH THE OREGON TEMPORARY TRAFFIC CONTROL HANDBOOK FOR OPERATIONS OF THREE DAYS OR LESS (DECEMBER 2011) ANY TIME VEHICLE OR PEDESTRIAN TRAFFIC IS INFLUENCED BY THE WORK. FOR WORK REQUIRING DEVICES IN PLACE LONGER THAN THREE (3) DAYS, A SITE SPECIFIC TRAFFIC CONTROL PLAN BASED ON THE PRINCIPLES IN PART 6 OF THE MUTCD, THE OREGON SUPPLEMENT AND ODOT'S 2015 STANDARD DRAWINGS TM800 –TM871, IS REQUIRED. ALL TRAFFIC CONTROL DEVICES SHALL MEET OR EXCEED THE NCHRP 350 REQUIREMENTS FOR CRASHWORTHINESS. COMPLETED SIGNAL SHUT DOWN REQUESTS MUST BE RECEIVED BY THE COUNTY A MINIMUM OF 3 WORKING DAYS PRIOR TO ANY PROPOSED SIGNAL SHUT DOWN.

NOTES

1. TEMPORARY EROSION AND SEDIMENT CONTROL MEASURES AS SHOWN SERVE AS THE INTENDED BASIS FOR STORMWATER POLLUTION PREVENTION PLANNING. AS GRADING AND SITEWORK PROGRESS IS MADE AND WEATHER CONDITIONS CHANGE, THE CONTRACTOR IS EXPECTED TO MODIFY THE MEASURES AS NEEDED IN ACCORDANCE WITH THE PROJECT STORMWATER POLLUTION PREVENTION PLAN (SWPPP). MATERIAL QUANTITIES TO ADDRESS CHANGES IN TESC NEEDS ARE TO BE CONSIDERED IN BID.
2. WHEN A DOUBLE ROW OF SILT FENCE IS CALLED FOR ON THE PLANS, THE TWO ROWS SHALL HAVE A MINIMUM SPACING OF 3 FEET AND A MAXIMUM SPACING OF 5 FEET.
3. FINISH GRADE CONTOURS SHOWN REFLECT TOP OF FINISH SURFACE ELEVATIONS WITHIN THE ROADWAY AND TRANSITIONS TO TOP OF ROUGH FUTURE SUBGRADE WITHIN THE SITE DEVELOPMENT PADS IN PREPARATION FOR FUTURE DETAILED DEVELOPMENT PLAN APPROVAL FOR EACH OF THE PADS.
4. ROUGH GRADING AND FUTURE PAD FINISHED FLOOR ELEVATIONS ARE APPROXIMATE AND SUBJECT TO DETAILED DESIGN AND PERMIT APPROVAL. SLIGHT VARIATIONS IN PAD GRADING, INCLUDING BUILDING FINISHED FLOOR ELEVATIONS, MAY OCCUR WITH INDIVIDUAL PAD DETAILED DEVELOPMENT PLAN APPROVAL AND DETAILED DESIGN.

ALTA/ACSM SURVEY

LOCATED IN THE S.E. 1/4 & S.W. 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, W.M. CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON
REFERENCE: STEWART TITLE PRELIMINARY TITLE REPORT SUPPLEMENTAL NO. 1
ORDER NO. 1016646 DATED APRIL 27, 2012

CERTIFICATION FOR SURVEY

1. THE SURVEY WAS MADE ON THE GROUND DURING APRIL AND MAY OF 2012, AND CORRECTLY SHOWS THE AREA OF THE SUBJECT PROPERTY, THE LOCATION AND TYPE OF ALL BUILDINGS, STRUCTURES AND OTHER IMPROVEMENTS SITUATED ON THE SUBJECT PROPERTY.

2. EXCEPT AS SHOWN ON THE SURVEY, THERE ARE NO OBSERVABLE, ABOVE GROUND ENCROACHMENTS BY THE IMPROVEMENTS ON THE SUBJECT PROPERTY UPON ADJOINING PROPERTIES, STREETS OR ALLEYS, OR BY THE IMPROVEMENTS ON ADJOINING PROPERTIES, STREETS OR ALLEYS UPON THE SUBJECT PROPERTY.

3. THE LOCATION OF EACH EASEMENT, RIGHT OF WAY, SERVITUDE, AND OTHER MATTER AFFECTING THE SUBJECT PROPERTY AND LISTED IN STEWART TITLE COMPANY, PRELIMINARY TITLE REPORT SUPPLEMENTAL NO. 1, ORDER NUMBER 1016646, DATED APRIL 27, 2012, WITH RESPECT TO THE SUBJECT PROPERTY, HAS BEEN SHOWN ON THE SURVEY, TOGETHER WITH THE APPROPRIATE RECORDING REFERENCES, TO THE EXTENT THAT SUCH MATTERS CAN BE LOCATED. THE PROPERTY SHOWN ON THE SURVEY IS THE PROPERTY DESCRIBED IN THAT TITLE REPORT.

4. THE SUBJECT PROPERTY HAS ACCESS TO AND FROM DULY DEDICATED AND ACCEPTED PUBLIC STREETS.

5. THE MEASURED BEARINGS AND DISTANCES SHOWN HEREON FORMS A MATHEMATICALLY CLOSED FIGURE WITH A MINIMUM LATITUDE AND DEPARTURE CLOSURE ERROR OF 1 IN 50,000.

6.THIS SITE LIES WITHIN WITHIN THE LIMITS OF FEMA MAP NUMBER 41005C0279D, WHICH IS NOT PRINTED SINCE THE ENTIRE MAP IS IN ZONE 'X' AS REITERATED ON FEMA MAP NUMBER 41005C1ND0A, EFFECTIVE DATE: JUNE 17, 2008.

7.SUBJECT PROPERTY IS ZONED, MUC-2 "MIXED USE CORRIDOR"

8. NO ORTHOPHOTOGRAPHY, PHOTOGRAMMETRIC MAPPING, LASER SCANNING, OR SIMILAR PRODUCTS WERE UTILIZED IN THE PREPARATION OF THIS SURVEY.

I HEREBY CERTIFY TO PACLAND; WAL-MART STORES, INC., A DELAWARE CORPORATION; WAL-MART REAL ESTATE BUSINESS TRUST, A DELAWARE STATUTORY TRUST; WAL-MART TRS, LLC, A DELAWARE LIMITED LIABILITY COMPANY; STEWART TITLE GUARANTY COMPANY;

THIS IS TO CERTIFY THAT THIS MAP OR PLAT AND THE SURVEY ON WHICH IT IS BASED WERE MADE IN ACCORDANCE WITH THE 2011 "MINIMUM STANDARD DETAIL REQUIREMENTS FOR ALTA/ACSM LAND TITLE SURVEYS", JOINTLY ESTABLISHED AND ADOPTED BY ALTA AND NSPS, AND INCLUDES ITEMS 1-6, 7(a), 7(b)(1), 7(c), 8, 9, 10(a), 11(b), 13, 14, 15-19, 20(a), 21 AND 22 OF TABLE 'A' THEREOF. THE FIELD WORK WAS COMPLETED ON JULY 9, 2012.

CES/NW MAKES NO WARRANTIES AS TO MATTER OF UNWRITTEN TITLE SUCH AS ACQUIESCENCE, ESTOPPEL, ADVERSE POSSESSION, ETC.

RYAN H. GODSEY
PROFESSIONAL LAND SURVEYOR
REGISTRATION NO.(OR) 65604

NARRATIVE

THE BASIS OF BEARINGS IS THE MONUMENTED CENTERLINE OF MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), AS ESTABLISHED BY MONUMENTS NO. 140 AND NO. 139 AS SHOWN HEREON PER SN 2010-176, SURVEY RECORDS, CLACKAMAS COUNTY, OREGON.

THE PURPOSE OF THIS SURVEY IS TO RETRACE THE BOUNDARIES AS SHOWN ON CLACKAMAS COUNTY SURVEY NUMBER SN2004-37. ALL MONUMENTS SHOWN WERE VISITED IN THE PROCESS OF THIS RETRACEMENT.

VERTICAL DATUM IS BASED ON A CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE RD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. GPS STA. LIBRARY 1990" ELEVATION = 452.739'

LEGAL DESCRIPTION PER TITLE REPORT

A TRACT OF LAND SITUATED IN THE SOUTHWEST QUARTER AND THE SOUTHEAST QUARTER OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON, SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOWS:

COMMENCING AT A THREE INCH BRASS DISK SET BY THE OREGON STATE HIGHWAY DEPARTMENT IN THE CENTERLINE OF MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213) AT ENGINEER'S STATION 31+00; THENCE SOUTH 73°27'47" EAST A DISTANCE OF 289.83 FEET TO THE NORTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-010378, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SAID POINT ALSO BEING ON THE SOUTHERLY RIGHT-OF-WAY LINE OF HILLTOP AVENUE; THENCE ALONG THE WESTERLY LINE OF SAID TRACT, SOUTH 27°39'59" EAST A DISTANCE OF 104.03 FEET TO THE SOUTHWEST CORNER OF SAID TRACT, AND BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE NORTHERLY LINE OF THOSE TRACTS DESCRIBED IN FEE NO. 72-08888 AND FEE NO. 69-09411, NORTH 78°20'26" EAST A DISTANCE OF 846.78 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 95-073144 AND FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 67°47'51" EAST A DISTANCE OF 59.75 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 96-010376 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE WESTERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 14°26'42" EAST A DISTANCE OF 407.81 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 96-007471, AND FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE COMMON LINE OF THOSE LANDS DESCRIBED IN FEE NO. 96-046001 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 88°29'47" EAST A DISTANCE OF 62.63 FEET; THENCE SOUTH 23°58'58" EAST A DISTANCE OF 133.44 FEET TO THE SOUTHEASTERLY CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE SOUTHERLY LINE OF SAID TRACT, AND ALONG THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 98-044696 AND FEE NO. 99-004122, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°38'35" WEST A DISTANCE OF 125.26 FEET; THENCE ALONG SAID SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, AND THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 95-045260, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°19'45" WEST A DISTANCE OF 45.33 FEET; THENCE ALONG SAID SOUTHERLY LINE, AND THE NORTHERLY LINE OF THOSE LANDS DESCRIBED IN FEE NO. 92-21067, FEE NO. 97-004501, AND FEE NO. 98-041108, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 76°29'26" WEST A DISTANCE OF 750.61 FEET TO A POINT IN THE NORTHEASTERLY RIGHT-OF-WAY OF BEAVERCREEK ROAD (MARKET ROAD NO. 11) (COUNTY ROAD NO. 398), SAID POINT BEING 30' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG SAID NORTHEASTERLY RIGHT-OF-WAY, NORTH 59°27'26" WEST A DISTANCE OF 206.63 FEET TO THE COMMON NORTHEASTERLY RIGHT-OF-WAY INTERSECTION OF SAID BEAVERCREEK ROAD AND MOLALLA AVENUE (FORMERLY STATE HIGHWAY NO. 213), SAID POINT BEING 35' NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE OF MOLALLA AVENUE; THENCE CONTINUING ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, ALONG THE ARC OF A 5694.58 FOOT RADIUS CURVE TO THE RIGHT A DISTANCE OF 66.39 FEET, THROUGH A CENTRAL ANGLE OF 00°40'05" (THE LONG CHORD OF WHICH BEARS NORTH 27°43'34" WEST A DISTANCE OF 66.39 FEET); THENCE NORTH 27°23'32" WEST A DISTANCE OF 307.30 FEET; THENCE NORTH 62°36'28" EAST A DISTANCE OF 5.00 FEET TO A POINT 40 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE, SAID POINT ALSO BEING ON THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 97-022793, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE LEAVING SAID NORTHEASTERLY RIGHT-OF-WAY LINE, AND CONTINUING ALONG SAID SOUTHERLY TRACT LINE, NORTH 78°20'26" EAST A DISTANCE OF 176.19 FEET TO THE SOUTHEASTERLY CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, NORTH 27°39'59" WEST A DISTANCE OF 73.67 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 560,272 SQUARE FEET, OR 12.862 ACRES, MORE OR LESS.

RECORD DESCRIPTIONS

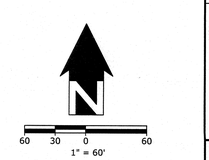
2004-091249 PARCEL 1
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD, SAID POINT BEING THE TRUE POINT OF BEGINNING; THENCE ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 10.28 FEET; THENCE ALONG THE SOUTHERLY LINE THAT TRACT DESCRIBED IN FEE NO. 72-08888 DEED RECORDS, CLACKAMAS COUNTY, OREGON. SOUTH 88°29'47" EAST A DISTANCE OF 653.92 FEET TO THE SOUTHEAST CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, NORTH 12°38'23" WEST A DISTANCE OF 110.72 FEET TO THE NORTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 81-19662, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, SOUTH 88°29'47" EAST A DISTANCE OF 120.00 FEET TO THE NORTHEAST CORNER OF SAID TRACT; THENCE ALONG THE EASTERLY LINE OF SAID TRACT, SOUTH 12°38'23" EAST A DISTANCE OF 120.00 FEET TO A POINT ON THE NORTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, NORTH 88°29'47" WEST A DISTANCE OF 771.22 FEET TO THE TRUE POINT OF BEGINNING.

CONTAINING AN AREA OF 19,837 SQUARE FEET, OR 0.455 ACRES, MORE OR LESS.

2004-091249 PARCEL 2
A TRACT OF LAND SITUATED IN THE SOUTHWEST 1/4 AND THE SOUTHEAST 1/4 OF SECTION 5, TOWNSHIP 3 SOUTH, RANGE 2 EAST, WILLAMETTE MERIDIAN, CITY OF OREGON CITY, CLACKAMAS COUNTY, OREGON. SAID TRACT IS MORE PARTICULARLY DESCRIBED AS FOLLOW:

COMMENCING AT THE EXTREME SOUTHERLY CORNER OF TRACT DESCRIBED IN CLACKAMAS COUNTY DEED BOOK "O", PAGE 265, SAID POINT BEING IN THE CENTERLINE OF MOLALLA AVENUE; THENCE SOUTH 88°29'47" EAST A DISTANCE OF 39.98 FEET TO A POINT BEING 35 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, THE CENTERLINE OF SAID ROAD; THENCE ALONG THE NORTHEASTERLY RIGHT-OF-WAY OF SAID MOLALLA AVENUE, NORTH 27°23'32" WEST A DISTANCE OF 67.85 FEET; THENCE NORTH 62°36'28" EAST A DISTANCE OF 5.00 FEET TO A POINT 40 FEET NORTHEASTERLY OF, WHEN MEASURED AT RIGHT ANGLES TO, SAID CENTERLINE, SAID POINT ALSO BEING ON THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 97-022793, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE LEAVING SAID NORTHEASTERLY RIGHT-OF-WAY LINE, AND CONTINUING ALONG SAID SOUTHERLY TRACT LINE, NORTH 78°20'26" EAST A DISTANCE OF 176.19 FEET TO THE SOUTHWEST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 96-010378, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE NORTHERLY LINE OF THOSE TRACTS DESCRIBED IN FEE NO. 72-08888 AND FEE NO. 69-09411, NORTH 78°20'26" EAST A DISTANCE OF 846.78 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 69-09411, FEE NO. 95-073144 AND FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-010376, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 67°47'51" EAST A DISTANCE OF 59.75 FEET TO THE COMMON CORNER OF THOSE LANDS DESCRIBED IN FEE NO. 96-010376 AND FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE CONTINUING ALONG THE WESTERLY LINE OF THAT TRACT DESCRIBED IN FEE NO. 96-007471, DEED RECORDS, CLACKAMAS COUNTY, OREGON, SOUTH 14°26'42" EAST A DISTANCE OF 407.81 FEET TO THE COMMON CORNER OF THOSE TRACTS DESCRIBED IN FEE NO. 69-09411, FEE NO. 96-007471, AND FEE NO. 96-046001, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF THAT TRACT OF LAND DESCRIBED IN FEE NO. 69-09411, DEED RECORDS, CLACKAMAS COUNTY, OREGON, NORTH 88°29'47" WEST A DISTANCE OF 322.36 FEET TO THE SOUTHEAST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 81-19662, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE EASTERLY LINE OF SAID TRACT DESCRIBED IN FEE NO. 81-19662, NORTH 1238'23" WEST A DISTANCE OF 120.00 FEET; THENCE ALONG THE NORTHERLY LINE OF SAID TRACT, NORTH 8829'47" WEST A DISTANCE OF 120.00 FEET; THENCE ALONG THE WESTERLY LINE OF SAID TRACT, SOUTH 12°38'23" EAST A DISTANCE OF 110.72 FEET TO THE SOUTHEAST CORNER OF THAT TRACT DESCRIBED IN FEE NO. 72-08888, DEED RECORDS, CLACKAMAS COUNTY, OREGON; THENCE ALONG THE SOUTHERLY LINE OF SAID TRACT DESCRIBED IN FEE NO. 72-08888, NORTH 8829'47" WEST A DISTANCE OF 653.92 FEET TO THE TRUE POINT OF BEGINNING.



CONTAINING AN AREA OF 284,038 SQUARE FEET, OR 6.521 ACRES, MORE OR LESS.

NOTES

1. THIS SURVEY MAKES NO GUARANTEES THAT THE UNDERGROUND UTILITIES SHOWN ARE ALL THE UTILITIES IN THE AREA. THE UNDERGROUND UTILITIES SHOWN ARE BASED ON LOCATE PAINT MARKINGS IN THE FIELD AND AS-BUILT MAPPING. UTILITIES SHOWN MAY NOT BE IN THE EXACT LOCATION AS NOTED ON THIS SURVEY, BUT ARE LOCATED AS ACCURATELY AS POSSIBLE FROM PAINT MARKINGS ON THE GROUND. IF KNOWN, DEPTHS OF UTILITIES ARE AS SHOWN. THE GAS LINE DEPTHS HAVE NOT BEEN VERIFIED. NORTHWEST NATURAL DESIGN STANDARDS REQUIRE 12" TO 18" OF COVER FOR SERVICE LINES AND 30" TO 36" OF COVER FOR MAIN LINES IN THIS AREA. THE AGE AND CONDITION OF ALL UTILITIES IS UNKNOWN AND CANNOT BE CERTIFIED BY A LAND SURVEYOR. CITY OF OREGON CITY WATER DISTRIBUTION SYSTEM DESIGN STANDARDS REQUIRE A STANDARD MINIMUM COVER OVER BURIED WATER MAINS OF 36" FROM FINISH GRADE. WATERLINE DEPTHS WERE NOT VERIFIED AS A PART OF THIS SURVEY.

2. STORM DRAIN AND SANITARY SEWER LINES SHOWN ARE APPROXIMATE AND BASED ON VISIBLE ABOVE GROUND EVIDENCE AND AS-BUILT MAPS.

3. AS OF THE DATE OF THE SURVEY, A GEOTECHNICAL REPORT WAS NOT RECEIVED, THEREFORE THE CONDITIONS OF ALL DRIVING SURFACES, SHOULDERS, CURBS AND SIDEWALKS (ON-SITE AND ADJACENT ROADS) ARE NOT NOTED.

4. SPOT ELEVATIONS ARE SHOWN AT TOP OF CURB, EDGE OF PAVEMENT AND CENTERLINE OF ROADWAYS.

5. POSTED SPEED LIMIT ON BEAVERCREEK ROAD IS 35 MPH. POSTED SPEED LIMIT ON THE MOLALLA AVENUE IS 35 MPH.

6. VERTICAL DATUM IS BASED ON THE CITY OF OREGON CITY BENCHMARK, A BRASS DISK LOCATED BY THE FLAG POLE IN FRONT OF THE OREGON CITY POLICE BUILDING, 320 WARNER MILNE RD, ELEVATION 447.729' (NGVD 1929) AND BENCHMARK 0030, A BRASS DISK STAMPED "DAVID EVANS AND ASSOCIATES, INC. Executive Summary

Project Description
The proposed project is located at 1367 Molalla Avenue, in the City of Oregon City, Clackamas County, Oregon. The site is located on Tax lots 32E05DB03300, 32E05DB03400, 32E05DB03200, 32E05DB03201, 32E05D00500, 32E05D00501, and 32E05D00602. The site is under the jurisdiction of Oregon City Public Works and the Clackamas County Water Environment Services (WES).

The existing property is approximately 12.86 acres (13.67 acres including the public access road) of scrub vegetation with isolated groups of trees and remnants of previously developed wrecking yard, gas station, and tavern.

The west portion of the existing site drains primarily on to the adjacent properties to the south. The east portion of the existing site drains primarily on to the adjacent properties to the east and northeast.

The proposed project includes a retail store (Parcel A), and a multi-family use (Parcel B), together with a public road through the site to provide access and utility service to each parcel (Parcel C), and a Quick Service Restaurant (QSR) (Parcel D). Parcels A, B, and D will receive interim rough grading, with finished conditions pending Detailed Development Plan approval for each of the parcels. The public access road includes a Right-of-Way (ROW) dedication at various widths and a 5-foot Public Utility Easement (PUE) along portions of the frontage of the parcels.

Design Criteria
The purpose of this report is to describe the project's stormwater management strategy and to show that the design meets the agency guidelines.

The standard stormwater requirements provided by Oregon City Public Works require detention, treatment, and infiltration. However, due to the presence of silty clay and a steep slope on the east side of the site, infiltration is not feasible on site.

This project utilizes the WES BMP Sizing Tool for designing the on-site stormwater facilities. The BMP Sizing Tool provides stormwater management design that will control flow durations ranging from 42% of the 2-year to the 10-year storm runoff as determined by the continuous model simulation integrated into the tool. Using this design methodology will provide the required treatment and flow control for the site, without the need for infiltration.

Proposed Drainage System
This project proposes to introduce a network of underground pipes, catch basins, curbs and gutters, to collect surface water runoff associated with the on-site and off-site public improvements. The proposed stormwater facilities will consist of lined rain gardens and lined detention ponds for water quality treatment and flow control. Stormwater detention will be required for both on-site private improvements and off-site public improvements. Space for detention of off-site public improvements is limited, and the detention facility cannot be installed within the right-of-way near the ultimate point of connection to the existing public storm system within the Natural Resource Overlay District (NROD) area in TL 500. Accordingly, the on-site stormwater facility will be sized to over-detain the on-site stormwater to compensate for public stormwater runoff as confirmed during the project's pre-application conference. The stormwater facilities will over detain and over treat these drainage basins to

account for the off-site public access road stormwater that will not be routed to the stormwater facilities.

Stormwater from Parcels A, B and C (Parcel C is the proposed public right-of-way within the main development area of TL3200, 3201, 3300, & 3400) will be routed to storm facilities in the southeast portion of the site, just north of the proposed public road, within the ROW. Stormwater for Parcel D will be routed to storm facilities within Parcel D. Parcel D stormwater will bypass the main storm facility after having received its own water quality and detention treatment. After being treated and detained, stormwater will be discharged to an existing storm pipe that discharges ultimately to Newell Creek. Outflows from the stormwater facilities will be regulated by flow control structures designed to release a peak flow rate not to exceed pre-developed runoff flow rates described above.

Conclusion

The proposed stormwater management systems for this project have been designed in accordance with regulatory criteria described above and consistent with sound engineering practice. This design has incorporated stormwater detention and stormwater quality BMP's. Therefore, no significant adverse impacts to the downstream stormwater system are expected because of the proposed development.

Project Location

Zone:	***MUC-2; Mixed-Use Corridor***

Site Drainage Analysis

Existing Conditions

The project site is located at 1367 Molalla Avenue, in the City of Oregon City, Clackamas County, Oregon. Tax lots 3300, 3201, & 3200 were previously developed as a wrecking yard between approximately 1953 and 2001/2002, with wrecking yard vehicle and structure removal occurring into 2005. Remnant surface features such as broken asphalt and foundations/concrete pads from prior wrecking yard operations are still visible in aerial photos of these parcels after 2005. A gasoline station and tavern formerly operated in the southwest portion of Tax Lot 3400. Each of these prior uses have been demolished and have been described in various Phase I & II Environmental Site Assessments. The southeast portion of TL 3400 and areas down-slope of the top of bluff on TL 3200 are covered in trees, while much of the remainder of the on-site properties exist in scrub vegetation or isolated groups of trees.

The public 18-inch storm line runs to the West of the subject property on the west side of Molalla Boulevard, and to the South of the subject property towards the North side of Beavercreek Road. There is an existing 48-inch stormwater outfall that discharges to Newell Creek. Our proposed stormwater runoff will utilize the existing outfall to Newell Creek.

Proposed Development

The proposed development includes one Quick Service Restaurant (QSR), a retail store, and a multi-family use, together with a public road through the site to provide access and utility service to each parcel. Stormwater from Parcels A, B and C will be routed to a lined rain garden which will then discharge to a lined detention pond for treatment of the 1-inch 24-hour water quality design storm and detention for the 10-year 24-hour storm event. The storm facilities for Parcels A, B and C will be a public storm facility within the public access road ROW. Stormwater from Parcel D will be routed to an on-site, private stormwater facility within Parcel D. The Parcel D storm facility will also consist of a lined rain garden discharging to a lined detention pond for treatment of the 1-inch 24-hour water quality design storm and detention for 42% of the 2-year to the 10-year 24-hour storm event. Following on-site treatment, runoff from Parcel D will bypass the public stormwater management system. The treated and detained stormwater from all the storm facilities will be routed through the off-site public access road to the existing discharge outfall to Newell Creek.

The public stormwater facility will over detain and over treat the on-site drainage basins to account for the off-site public access road stormwater that will not be routed to the stormwater facilities.

Soils

According to the NRCS Web Soil Survey, this site is composed mostly of Jory silty clay loam. Based on a geotechnical engineering report provided by Terracon Consultants, dated September 12th, 2022, the existing soil at the site consists of a surface layer of red clay surface soil. According to the Terracon report, groundwater was encountered from 4 to 20 feet below the surface. The Terracon report states that the groundwater observed in their borings appear to represent perched groundwater and does not

appear to be continuous in nature and groundwater fluctuations occur. See Appendix A of this report for additional information regarding soils and groundwater.

Drainage Basin Areas

The proposed Parcels A, B, and D, together with the public road are assumed in the full-build condition for the purposes of this analysis so that the various stormwater management facilities can be sized correctly. Parcels A, B, and D will undergo future Detailed Development Plan review in the future and will address any design changes from the assumptions in this report. While Parcel D will provide its own on-site storm facility with its DDP application, we've evaluated approximate sizing for this facility to determine impacts to the storm system downstream of Parcel D.

This project will consist of 5 separate drainage basins, as shown in the Drainage Basin Map in Appendix B. The project will create 377,077 sf of private impervious area and 89,144 sf of pervious area and will treat and detain 377,077 sf of impervious and 55,689 sf of pervious area. The project will create or improve 30,169 sf of public impervious and 7,003 sf of public pervious area.

On-site Private Basin 1:

This basin consists of Parcel A, the proposed retail store. The basin is approximately 1.68 acres of impervious roof, pavement, and sidewalk (PRI-1) and 0.15 acres of pervious landscape area (PRP-1). The basin will be conveyed to the public rain garden and detention pond facilities for treatment and detention, where it will be mixed with stormwater from On-site Basin 2 and On-site Basin 3. The treated and detained stormwater will then be conveyed to the point of connection with the existing 48-inch public storm pipe prior to its existing discharge into a tributary of Newell Creek. The approximately 5,770 sf of existing pervious area on the west side of the parcel that currently drains off-site onto Molalla Ave will be reduced to 1,451 sf of pervious area draining off-site. This area will be graded and stabilized, but will not be treated or detained, as it is infeasible to collect, is not pollution generating, and will continue to naturally drain off site. Please see the Drainage Basin Map in Appendix B.

On-site Private Basin 2:

This basin consists of Parcel B, the proposed multi-family use. The basin is approximately 4.12 acres of impervious roof, pavement, and sidewalk (PRI-2) and 0.53 acres of pervious landscape area (PRP-2). The basin will be conveyed to the public rain garden and detention pond facilities for treatment and detention, where it will be mixed with stormwater from On-site Basin 1 and On-site Basin 3. The treated and detained stormwater will then be conveyed to the point of connection with the existing 48-inch public storm pipe prior to its existing discharge into a tributary of Newell Creek. The approximately 228,279 sf of existing pervious area on the east side of the parcel that currently drains east will be reduced to 16,275 sf of pervious area draining east. This area will be graded and stabilized, but will not be treated or detained, as it is infeasible to collect, is not pollution generating, and will continue to naturally drain off site. The east portion of Parcel B is a Geologic Hazard Area (steep slopes). The limits of disturbance do not get closer than 35 feet from the top of the steep slope near the edge of the Geologic Hazard Area. This portion of the site will remain as is, other than a natural surface pedestrian pathway, and existing drainage patterns here will continue.

On-site Private Basin 3:

This basin consists of Parcel D, the proposed QSR. The basin is approximately 1.23 acres of impervious roof, pavement, storm facilities, and sidewalk (PRI-3) and 0.40 acres of pervious landscape area (PRP-3).

The basin will be conveyed to a private rain garden and detention pond, located within Parcel D, for treatment and detention. The treated and detained stormwater will then bypass the public stormwater facility treating Basins 1, 2, & 3 and connect to the proposed storm system downstream from the public stormwater facility where it will then be conveyed to the point of connection with the existing 48-inch public storm pipe prior to its existing discharge into a tributary of Newell Creek. The approximately 182,811 sf of existing pervious area on the southwest side of the site that currently drains south will be reduced to 15,729 sf of pervious area draining off-site. This area will not be treated or detained, as it is infeasible to collect, is not pollution generating, and will continue to naturally drain off site.

The private stormwater management facility in Basin 4 will be designed concurrently with the detailed development of Parcel D. The analysis in this section is provided to show that the proposed Detailed Development Plan storm system can accommodate the future development of Parcel D. Were the Parcel D storm system to become overwhelmed by a large storm event, we recommend an overflow drainage structure be designed to capture the 100-year 24-hour storm event prior to it overtopping the planned facility and send that flow into the by-pass storm piping provided in the proposed public street. The storm pipes serving Parcel D will be sized to convey the 100-year 24-hour storm event for Basin 4/Parcel D as well.

Off-site Public Basin 1:
The proposed public access road runs through the site from Molalla Avenue to the southeast corner of the site. From the southeast corner of the site, the public access road snakes down to Beavercreek Road. This second portion of the public access road is off-site. The basin is approximately 0.69 acres of impervious pavement and sidewalk (PUI-1) and 0.16 acres of pervious landscape area (PUP-1). Space for detention of off-site public improvements is limited, and the detention facility cannot be installed within the right-of-way near the ultimate point of connection to the existing public storm system within the Natural Resource Overlay District (NROD) area in TL 500. Accordingly, the on-site public stormwater facilities will over detain and over treat the on-site basins to account for the off-site public access road stormwater that will not be routed to the stormwater facilities.

Stormwater in this basin will be captured in catch basins and conveyed to the existing outfall location adjacent to the off-site public access road, that discharges to Newell Creek.

Were this system to become overwhelmed by a large storm event that it was unable to convey or to become clogged, the catch basins would begin to overflow and flow down the off-site public access road to the south, avoiding the steep slope just east of the site and public access road, and overflow near the existing discharge point. To guard against such an overflow, inlets and inlet leads in this low point will be oversized to minimize the chances of overflow.

On-site Public Basin 2:
This basin consists of Parcel C, the on-site public access road. The basin is approximately 1.61 acres of impervious pavement, storm facilities, and sidewalk (PUI-2) and 0.28 acres of pervious landscape area (PUP-2). The basin will be conveyed to the public rain garden and detention pond facilities for treatment and detention, where it will be mixed with stormwater from On-site Basin 1 and On-site Basin 2. The treated and detained stormwater will then be conveyed to point of connection with the existing 48-inch public storm pipe prior to its existing discharge into a tributary of Newell Creek.

The public stormwater facility lies inside a small basin that, if it were to fill up, would overtop into the adjacent street at elevation 433 feet. A HydroCAD model was run (see Appendix C) to model this basin's capacity during a 100-year 24-hour storm event. During this storm event, the water surface elevation within this basin peaks at 428.93 feet. Therefore, the stormwater facility basin will contain the 100-year 24-hour storm event and any overflow into the street or steep slopes to the east is not expected to occur.

For analysis and sizing of BMPs, the project development area is broken into ten Drainage Management Areas (DMAs), as defined in the WES BMP Sizing Tool. The area and condition of the ten DMAs are shown in Table 1 below. See Appendix B for the Basin Map.

Table 1 –Drainage Management Areas

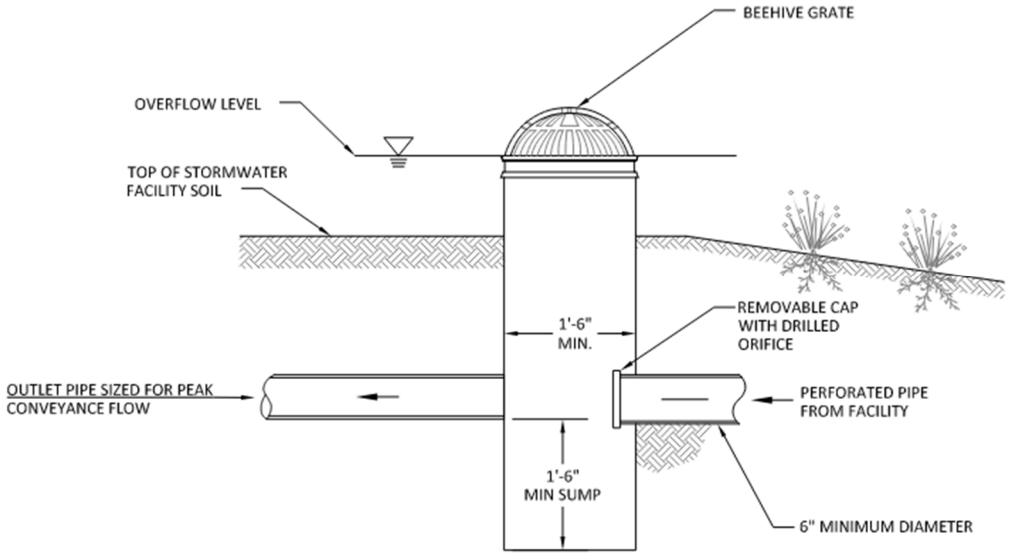
On-Site Basin Areas Draining to Public Storm Facilities			
Basin	**Area (sf)**	**Pre-developed Condition**	**Post-developed Condition**
PRI-1	73,175	Pervious - Forested	Impervious - Roof/Pavement
PRP-1	6,613	Pervious - Forested	Pervious - Landscape
PRI-2	180,369	Pervious - Forested	Impervious - Roof/Pavement
PRP-2	20,596	Pervious - Forested	Pervious - Landscape
PUI-2	70,148	Pervious - Forested	Impervious - Pavement
PUP-2	15,527*	Pervious - Forested	Pervious - Landscape
On-Site Basin Area Draining to Private Storm Facilities			
PRI-3	53,385	Pervious - Forested	Impervious – Roof/Pavement
PRP-3	12,953*	Pervious - Forested	Pervious - Landscape
Total On-site DMA*	***437,421***		
Off-Site Basin Area			
PUI-1	30,169	Pervious - Forested	Impervious - Pavement
PUP-1	7,003	Pervious - Forested	Pervious - Landscape
Total Off-site DMA	***37,172***		
Total DMA's*	***473,203***		

**DMA's do not include the stormwater facility area (BMP's)*

Modeling

The WES BMP Sizing Tool was utilized to assist with BMP sizing and calculations for the water quality, 2-year and 10-year storm events. Stormwater treatment facility's flow control structures were designed using the WES BMP Sizing Tool, for those events as well. Refer to BMP Sizing Report attached in Appendix D.

Flow control structure diagrams are shown in the figures below:



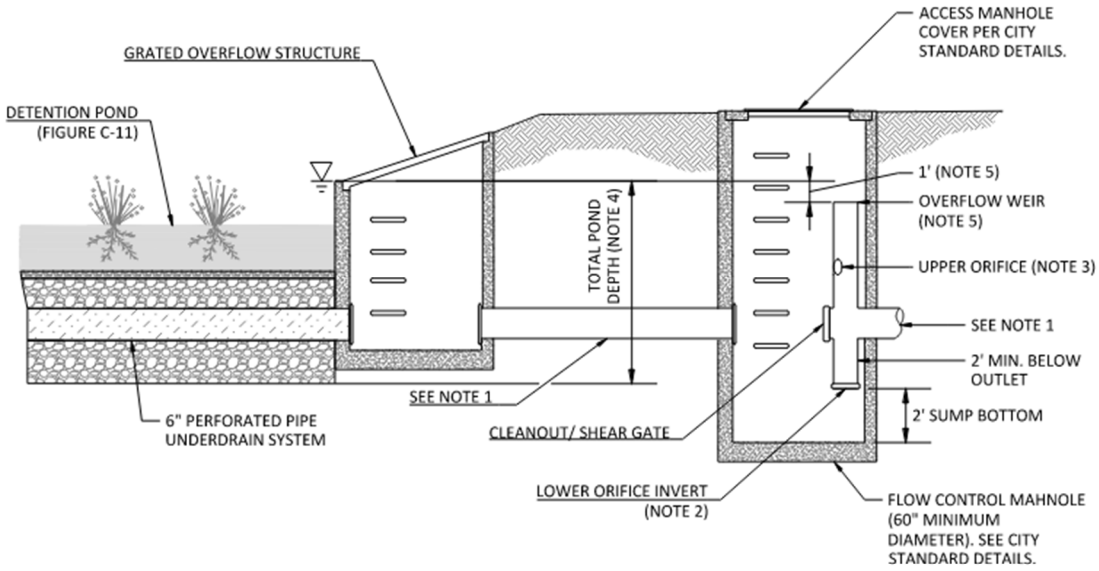


Figure 1 - Rain Garden Flow Control Structure

NOTES:

1. PIPE SIZED FOR PEAK DESIGN STORM AS DETERMINED BY ENGINEER .
2. LOWER ORIFICE: THE INVERT ELEVATION OF THE LOWER ORIFICE MUST BE AT, OR BELOW, THE POND BOTTOM (BOTTOM OF THE 3 FEET OF DRAIN ROCK & GROWING MEDIA).
3. UPPER ORIFICE: THE UPPER ORIFICE SHOULD BE AT AN ELEVATION 2/3 OF THE TOTAL POND DEPTH ABOVE THE POND BOTTOM.
4. TOTAL POND DEPTH, PER FACILITY SIZING MODEL, INCLUDES GROWING MEDIA, SEPARATION LAYER, AND DRAIN ROCK AS SHOWN ON FIGURE C-11.).
5. OVERFLOW WEIR: 1' BELOW MAXIMUM WATER ELEVATION OR TOP OF TOTAL POND DEPTH.

Figure 2 - Detention Pond Flow Control Structure

The required storm facility sizes and proposed facility sizes, according to the BMP Sizing Tool, are shown in Table 2.

Table 2 –Storm Facility Sizing

Rain Garden Storm Facilities		
Storm Facility	**Required Minimum Surface Area (sf)**	**Proposed Surface Area (sf)**
Public Rain Garden (lined)	5,681.0	6,000.0
Private Rain Garden (lined)	934.8	1,700.0
Detention Pond Storm Facilities		
Storm Facility	**Adequate Size?***	**Proposed Facility Volume (cf)**
Public Detention Pond (Lined)	Yes	2,911.8
Private Detention Pond (Lined)	Yes	1,027.7

**According to the BMP Sizing Tool (See Appendix D)*

Conclusion

The proposed stormwater management system for this project has been designed in accordance with regulatory criteria described above and is consistent with sound engineering practice. This design has incorporated stormwater quality treatment and detention BMPs to the maximum extent practicable. Therefore, no significant adverse impacts to surrounding surface water are expected as a result of the proposed improvements.

Terracon Project No. 82215043

Dear Mr. Rossman:

We have completed a Geotechnical Engineering evaluation for the above referenced project. Our services were performed in accordance with our Master Services Agreement dated November 20, 2017, and the Task Order dated June 22, 2021, and our Change Orders dated December 9, 2021, and June 10, 2022.

This report presents the findings of the subsurface exploration and provides geotechnical recommendations concerning slope stability, earthwork and the design and construction of foundations, floor slabs, and pavements for the proposed project.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report or if we may be of further service, please contact us.

Sincerely,
Terracon Consultants, Inc.

Ryan T. Houser, RG, CEG
Project Geologist

Geotechnical Engineering Report

Oregon City Development
1367 Molalla Avenue
Oregon City, Clackamas County, Oregon

Terracon Project No. 82215043

September 12, 2022

INTRODUCTION

This report presents the results of our subsurface exploration and geotechnical engineering services performed for the proposed apartment complex, retail pads, and related pavements and utilities to be located at 1367 Molalla Avenue in Oregon City, Clackamas County, Oregon. The purpose of these services is to provide information and geotechnical engineering recommendations relative to:

- Subsurface soil conditions
- Groundwater conditions
- Site preparation and earthwork
- Demolition considerations
- Excavation considerations
- Slope stability considerations
- Foundation design and construction
- Floor slab design and construction
- Seismic site class per IBC
- Lateral earth pressures
- Pavement design and construction
- Slope hazard mitigation

The geotechnical engineering Scope of Services for this project included the advancement of one drilled boring and installation of a piezometer to monitor groundwater levels. Previous investigations at the site included advancement of 29 drilled borings and excavation of 68 test pits to depths ranging from approximately 3 to 50 feet below existing site grades. Logs of current and previous explorations are included in the **Exploration Results** section.

Maps showing the site and exploration locations are shown on **Figure 1 - Site Location** and **Figures 2 through 4 - Exploration Plans** in the **Figures** section. The results of the laboratory testing performed on soil samples obtained from the site during the field exploration are included on the boring logs and/or as separate graphs in the **Exploration Results** section.

SITE CONDITIONS

The following description of site conditions is derived from our site visit in association with the field exploration and our review of publicly available topographic maps.

Item	Description
Parcel Information	The project is located at 1367 Molalla Avenue in Oregon City, Clackamas County, Oregon. The site consists of 4 tax lots totaling approximately 12.86 acres. The approximate center of the site is located at the following coordinates: ■ Latitude: 45.3356° N ■ Longitude: 122.5881° W
Existing Improvements	Former buildings were removed, although several retaining walls, foundations, and floor slabs remained as of our last site visit in 2022.
Current Ground Cover	The majority of the site was covered with grass, blackberry bushes, and scattered trees. The eastern edge of the site was densely vegetated with trees and blackberry bushes.
Existing Topography	The majority of the site consisted of three graded benches that stepped down to the east. Each bench was nearly level to gently sloping and were separated by graded slopes up to about 10 feet high with gradients up to about 3 horizontal to 1 vertical (3H:1V). The eastern edge of the site drops steeply down at inclinations in the range of 1½H:1V to ½H:1V to the east toward Newell Creek. The overall slope system height is on the order of 200 feet in vertical drop. We understand that this steep slope area contains active and ancient landslide complexes and has been studied extensively by Portland State University geologists and other researchers.

We also collected photographs at the time of our field exploration program. Representative photos are provided in our **Photography Log**.

PROJECT DESCRIPTION

Our initial understanding of the project was provided in our proposal and was discussed during project planning. Several iterations of collaboration has transpired since the project was initiated, and our final understanding of the project conditions is as follows:

Item	Description
Information Provided	The following documents were provided to us: ■ "Site Plan," Sheet 1.11, prepared by Studio 15 Architecture, Inc., dated June 4, 2021. ■ "Preliminary Existing Conditions Survey," prepared by S&F Land Services, dated June 2021. ■ Oregon City Multi-Family Concept Grading Pavement Plans, Sheets C1.0, C2.0, C2.1, C3.0, C3.1, C4.00," prepared by Kimley-Horn, dated May 27, 2022. We were also provided the geotechnical report for the original planned structure.
Project Description	The proposed development is shown on the attached **Exploration Plans** (**Figures 2 through 4**), and includes construction of: ■ 15 multi-story (2 to 3) apartment buildings with a total of 236 dwelling units. Some of the buildings will incorporate ground level parking structures with apartments above. ■ Covered parking areas (carports). ■ 2 "pad-ready" development pads along the Molalla Avenue frontage for single story retail development. ■ A clubhouse building ■ Swimming pool Associated paved parking and drive lane areas
Building Construction	The proposed apartment and clubhouse buildings will be wood-framed with a slab-on-grade ground floor.
Finished Floor Elevation	The proposed apartment complex will be developed close to existing site grades. Final finish floor elevations are undetermined at this time.
Maximum Loads (Assumed)	■ Columns: 40 kips ■ Walls: 4 kips per linear foot (klf) ■ Slabs: 150 pounds per square foot (psf)
Below-Grade Structures	Development will include construction of a subsurface utility vault that will incorporate restrained retaining walls.
Free-Standing Retaining Walls	Development may include construction of free-standing retaining walls to accommodate grade changes along the eastern edge of the site and for the southeast road extension. We understand retaining walls up to 11 feet in height may be constructed.

Item	Description
Pavements	Paved driveway and parking will be constructed on the perimeter of the site. The Site Plan indicates parking will include 423 parking spaces. Both rigid (concrete) and flexible (asphalt) pavement sections will be incorporated into the final design. Anticipated traffic is as follows: ■ Autos/light trucks: 1,393 vehicles per day ■ Light delivery and trash collection vehicles: 20 vehicles per week ■ Tractor-trailer trucks: <5 vehicles per week The pavement design period is 20 years.
Estimated Start of Construction	Summer 2023

EXISTING GEOTECHNICAL REPORTS

Our Scope of Services is based on our understanding of the project as described by The Wolff Company and the expected subsurface conditions as described below. Terracon previously completed the following reports for the project site:

- "Preliminary Results of Slope Stability Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon," prepared by Zipper Zeman Associates (ZZA, now Terracon since 2005), dated July 3, 2002.
- "Subsurface Exploration and Geotechnical Engineering Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon," prepared by ZZA, dated February 13, 2004.
- "Preliminary Engineering Geology and Soil Engineering Report, Proposed Retail Development, Molalla Avenue and Beavercreek Road Oregon City, Oregon," prepared by Terracon, dated October 8, 2012.

GEOTECHNICAL CHARACTERIZATION

Geology

The site is located in the northern Willamette Valley geologic province, which consists of a structural trough between the Coastal Range and the Cascade Range. This basin is underlain by thick deposits of sand and gravel washed into it during the Pliocene epoch when the climate in the area was very dry. These granular deposits are locally covered by the Boring lavas (Qtb) in northwest Clackamas County.

Based on the *Oregon Geologic Data Standard v. 2.1* and Oregon Department of Geology and Mineral Industries *Geologic Map of the Oregon City 7.5' Quadrangle, Clackamas County, Oregon, 2009* this site is located within a geologic unit mapped as Tbc-Basalt of Canemah defined as flow or flows of grey medium-grained, olivine basalt. The Oregon Department of Geology and Mineral Industries (DOGAMI), Bulletin 99, *Geologic Map of the Canby and Oregon City Quadrangles, Oregon 1979*, maps the site as consisting of Boring lavas (Qtb), which it describes as Pliocene-Pleistocene lavas, light-gray, open-textured olivine basalt; flow structures common; includes some pyroclastic material of local extent; widely spaced joint pattern. Lavas and breccias have weathered to a residual red clay surface soil. Vertical exposures are susceptible to mass movement and deep bedrock sliding because of failure of underlying material (see the description below with clay materials within the Troutdale unit).

The Boring Lava deposits overly the Troutdale (Tpt), which are described as Pliocene sandstone and conglomerate; indurated beds and lenses of well-sorted sand and cobbly gravel with up to 30 percent quartzite clasts. Some sand originally composed of volcanic glass have altered to an impermeable high shrink-swell clay. The clay can be unstable and cause overlying competent units to fail by landslide. The publications indicate that on slopes where this clay layer daylights, one generally encounters a spring. Also, if layers dip out of the slope, it can become a failure plane for a slump or slump-earthflow when the pore water pressure has built up to a critical value on top of the clay layer.

Based on the *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs, O-06-27, 2006* and the *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon, IMS-26, 2009,* a mapped landslide was identified adjacent to the site to the east. The landslide is identified as a prehistoric or ancient landslide (movement greater than 150 years ago). This is defined by landslide features that are slightly eroded and there is no evidence of historic (recent in last 150 years) movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

The borings completed for this report and the previously referenced 2004 ZZA report are generally consistent with the above geologic mapping for the Boring Lavas/Basalt of Canemah, although the basalt has become deeply weathered in certain areas. The Troutdale unit was not encountered to the maximum depth of the borings at approximately 90½ feet below the ground surface. Although direct evidence of landslide features were not readily observed during our exploration programs for the 2004 report, we did observe the general headscarp area of the ancient landslide area during our 2012 and 2021 slope reconnaissances with the aid of the recent Lidar-based landslide maps.

Seismic Hazards

Seismic hazards resulting from earthquake motions can include slope stability, liquefaction, and surface rupture due to faulting or lateral spreading. Liquefaction is the phenomenon wherein soil strength is dramatically reduced when subjected to vibration or shaking.

We reviewed the Statewide Geohazards Viewer (HazVu) published by the Oregon Department of Geology and Mineral Studies (DOGAMI) and available online[1]. The viewer categorizes the expected earthquake shaking from light, moderate, strong, very strong, severe and violent; and the landslide susceptibility from low, moderate, high, and very high.

- Earthquake Liquefaction Hazard: Non-Liquefiable
- Expected Earthquake Shaking: Very Strong
- Landslide Susceptibility (due to earthquake): Low (Landsliding Unlikely) on the majority of the site, with Moderate (Landsliding Possible) to Very High (Existing Slide) on the eastern margin of the site. See **Engineering Geology Update** section for additional discussion.

Faults

The United States Geological Survey (USGS) Quaternary Fault and Fold Database of the United States published a report containing descriptions of nearby faults. Faults in the project vicinity include the Bolton fault (No.874), the Oatfield fault (No.875), and the Portland Hills fault (No.877). Published information pertaining to each fault or fault zone is provided in the following tables:

Bolton fault (Class B) No. 874

Information	Description
Length	9 km
Strike (degrees)	N53°W
Sense of Movement	Reverse
Dip Direction	SW
Slip-rate Category	Less than 0.2 mm/yr
Most recent prehistoric deformation	Undifferentiated Quaternary (<1.6 Ma)
Distance from Fault	1 km NE

[1] Statewide Geohazards Viewer (HazVu) published by the Oregon Department of Geology and Mineral Industries (DOGAMI) https://gis.dogami.oregon.gov/hazvu/

Oatfield fault (Class A) No. 875

Information	Description
Length	29 km
Strike (degrees)	N41W
Sense of Movement	Reverse, Right lateral
Dip Direction	NE
Slip-rate Category	Less than 0.2 mm/yr
Most recent prehistoric deformation	Undifferentiated Quaternary (<1.6 Ma)
Distance from Fault	2 km NNE

Portland Hills fault (Class A) No. 877

Information	Description
Length	49 km
Strike (degrees)	N37°W
Sense of Movement	Reverse, Right lateral
Dip Direction	SW
Slip-rate Category	Less than 0.2 mm/yr
Most recent prehistoric deformation	Undifferentiated Quaternary (<1.6 Ma)
Distance from Fault	5 km NE

Based on our review of the available fault information, the depth to bedrock, and the site's proximity to the nearest known faults, it is our opinion that the risk of surface rupture due to ground faulting is low.

Groundwater Conditions

We observed our explorations while drilling and after completion for the presence and level of groundwater. The water levels observed in the explorations are provided on the boring logs in **Exploration Results**, and are summarized below.

Boring Number	Approximate Ground Surface Elevation (feet) [1]	Observation Date	Approximate Depth to Groundwater/ Seepage while Drilling/Excavating (feet) [1]
02-B-3	447	October 29, 2001	19
02-B-22	451	March 7, 2002	20
02-MW-1	445	October 31, 2001	14
02-MW-1	445	November 2, 2001	8
02-MW-3	456	October 31, 2001	16
02-MW-3	456	November 2, 2001	17.5
02-MW-4	447	October 31, 2001	15
02-MW-4	447	November 2, 2001	11.2
02-MW-5	445	October 31, 2001	15
02-MW-5	445	November 2, 2001	11.5
02-TP-8	445	November 1, 2001	11
02-TP-43	426	March 4, 2002	9
02-TP-1A	435	March 1, 2002	9
02-TP-8A	442	March 1, 2002	6½
02-TP-12A	452	March 2, 2002	4
02-TP-20A	452	March 2, 2002	9½
21-B-1[2]	429	December 2021 – July 1, 2022	(not encountered)

1. Based on elevations obtained from the site topographic plan. Elevations may differ from those presented on the attached logs, which were based on a previous topographic map of the site.
2. A vibrating wire piezometer was installed at a depth of 30¾ feet below the ground surface (bgs), at the top of the basaltic bedrock.

Groundwater observations presented above appear to represent perched groundwater and does not appear to be continuous in nature. Groundwater level fluctuations occur due to seasonal variations in the amount of rainfall, runoff and other factors not evident at the time the borings were performed. Therefore, groundwater levels during construction or at other times in the life of the structure may be higher or lower than the levels indicated on the boring logs. The possibility of groundwater level fluctuations should be considered when developing the design and construction plans for the project.

A vibrating wire piezometer was installed in Boring 21-B-1 near the top of the descending slope at the east end of the site. The instrument was placed immediately above the basaltic andesite within the boring at a depth of approximately 30 feet bgs. As of the date of this report, groundwater

was not recorded by this instrument. Groundwater levels will continue to be measured within this boring throughout 2022.

GeoModel

We have developed a general characterization of the subsurface conditions based upon our review of the subsurface exploration, laboratory data, geologic setting and our understanding of the project. This characterization, termed GeoModel, forms the basis of our geotechnical calculations and evaluation of site preparation and foundation options. Conditions encountered at each exploration point are indicated on the individual logs. The individual logs can be found in the **Exploration Results** section and the GeoModel can be found on **Sections A-A', B-B', and C-C'** (Figures 10 through 12) in the **Figures** section of this report. As part of our analyses, we identified the following model layers within the subsurface profile.

Model Layer	Layer Name	General Description
1	**Existing Fill**	Topsoil, Asphalt, Silty Sand Fill, Clayey Silt Fill, Poorly Graded Gravel Fill, Gravelly Silt Fill placed during previous grading at the site
2	**Residual Soil (Native)**	Silt with trace Clay, Clayey Sand with Gravel, contains a variable amount of basaltic andesite boulders and cobbles
3	**Boring Lava**	Basaltic Andesite, fresh to slightly weathered, slightly fractured to very fractured

ENGINEERING GEOLOGY UPDATE

Terracon previously prepared an engineering geology report for the site, the results of which were presented in our referenced October 8, 2012, report. A copy of the 2012 report is attached at the end of this report. As part of our current scope of work, Terracon performed an engineering geology reconnaissance of the site slopes to document current site conditions. In addition, we reviewed aerial photographs, geologic maps, and geologic hazard maps produced since completion of our 2012 report, as detailed in the following sections.

RESEARCH

Geologic and Geologic Hazards Maps Review

Terracon reviewed the following geologic and geologic hazard maps that include the project site that have become available since our 2012 reports were issued:

- 2012 Oregon Department of Geology and Mineral Industries (DOGAMI) Open-File Report O-12-02, Lidar-based surficial geologic map and database of the greater Portland, Oregon, area, Clackamas, Columbia, Marion, Multnomah, Washington, and Yamhill Counties, Oregon,

and Clark County, Washington, by Lina Ma, Ian P. Madin, Serin Duplantis, and Kendra J. Williams

- 2013 DOGAMI Open-File Report O-13-08, Landslide hazard and risk study of northwestern Clackamas County, Oregon, by William J. Burns, Katherine A. Mickelson, Cullen B. Jones, Sean G. Pickner, Kaleena L. B. Hughes, and Rachel Sleeter.
- 2020 U.S. Geological Survey Scientific Investigations Map SIM-3443, Geologic map of the greater Portland metropolitan area and surrounding region, Oregon and Washington, by Wells, R.E., Haugerud, R.A., Niem, A.R., Niem, W.A., Ma, Lina, Evarts, R.C., O'Connor, J.E., Madin, I.P., Sherrod, D.R., Beeson, M.H., Tolan, T.L., Wheeler, K.L., Hanson, W.B., and Sawlan, M.G.

Based on our review, the geologic mapping presented on these maps is consistent with the mapped publications discussed in our referenced engineering geology report. The Landslide Hazard mapping (2013) indicates the eastern portion of the site, including the area of the headscarp and recommended setback, has a "high" potential for deep-seated landslides. The mapping indicates the eastern approximate quarter of the area of proposed development has a "moderate" potential for deep-seated landslides. The shallow landslide potential is "high" along the landslide scarp, and "moderate" directly above the landslide scarp. The slope between the site and the residential properties to the north also shows a "moderate" potential for shallow landslides. The landslide hazard susceptibility depicted on these maps is consistent with those discussed in the referenced reports prepared for the site. Portions of the landslide susceptibility maps showing the approximate site boundaries are attached as **Figure 6 - Deep Landslide Susceptibility Map** and **Figure 7 - Shallow Landslide Susceptibility Map** in the **Figures** section of this report.

Aerial Photograph Review

We reviewed aerial photographs taken from 2012 to 2020 showing the site to determine if significant changes to vegetation or slope configuration are apparent, which may indicate a slope failure. Our aerial photograph review did not identify any areas showing significant changes to vegetation or slope configuration on the scarp; however, two areas below the landslide headscarp showed vegetation patterns that appeared to be inconsistent with the surrounding areas. These areas were specifically visited during our site reconnaissance, which is described in the following section.

ENGINEERING GEOLOGIC RECONNAISSANCE

Terracon Consultants, Inc., Project Geologist Ryan T. Houser, CEG, performed a surface reconnaissance of the subject property and adjacent slopes on July 1, 2021.

The property was bordered to the west by Molalla Avenue, to the north by single-family and multi-family residences fronting on Hilltop Avenue, to the south by businesses fronting on Beavercreek

Road, and to the east by a forested natural area (Newell Creek Canyon Natural Area). The majority of the site consisted of three graded benches that stepped down to the east. Each bench was nearly level to gently sloping and were separated by graded slopes up to about 10 feet high with gradients up to about 3 horizontal to 1 vertical (3H:1V). Topography of the site is consistent with that shown on the existing conditions survey map provided by the client, as shown on **Figure 8 - Topographic Map** in the **Figures** section of this report. Photographs taken at the time of our reconnaissance are presented in the **Photography Log**.

The former building pad portions of the site above the headscarp were vacant and free of structures. This portion of the site appeared to be in a condition virtually identical to that described in the referenced reports. No signs of slope instability were noted on this portion of the site.

The headscarp appeared to be in a condition identical to that described in the referenced reports, with no indicators of additional failures noted during our reconnaissance. The slope was generally vegetated with fir and oak trees. The majority of the trees on the slope exhibited straight trunks. We noticed several recent treefalls on the slope, which appeared to be the result of wind and/or ice and not slope failures since the disturbed soils were limited to the root wads of the fallen trees.

The areas of variable vegetation noted during our review of aerial photographs were located near the toe of the headscarp within the natural area, as shown on **Figure 9 - Reconnaissance Plan** in the **Figures** section of this report. Both areas contained vegetation different than the surrounding trees. The soils in these areas had a higher moisture content than the slope or surrounding areas at the base of the headscarp. A spring was located at the base of the slope east of the northeastern property corner at the northern “wet soils” area shown on **Figure 9 - Reconnaissance Plan** in the **Figures** section of this report. Based on topography, these areas represent “sag ponds” that often form at the base of headscarps after a landslide. In this case, the sag ponds did not contain standing water but did maintain a higher soil moisture content than the surrounding soils that was not conducive to tree growth. The areas surrounding the sag ponds were vegetated with mature trees, with no indications of recent reactivations of the landslide.

SEISMIC CONSIDERATIONS

Seismic Design

The seismic design requirements for structures are based on the Seismic Design Category. Site Classification is required to determine the Seismic Design Category for a structure. The Site Classification is based on the upper 100 feet of the site profile defined by a weighted average value of either shear wave velocity, standard penetration resistance, or undrained shear strength in accordance with Section 20.4 of ASCE 7-16.

Description	Value
2019 Oregon Structural Specialty Code (OSSC) [1]	D[2]
Site Latitude	45.3360°N
Site Longitude	122.5880°W
S_S MCE_R Ground Motion for a Short Period [3]	0.812g
S_1 MCE_R Ground Motion for a 1-Second Period [3]	0.366g
PGA_M Site Modified Peak Ground Acceleration	0.451

1. Seismic site classification in general accordance with the *2019 Oregon Structural Specialty Code (OSSC)*, which refers to ASCE 7-16.
2. ASCE 7-16 requires a site soil profile extending to a depth of 100 feet be used for seismic site classification. Borings at this site were extended to a maximum depth of 90½ feet. The site properties below the boring depth to 100 feet were estimated based on our experience and knowledge of geologic conditions of the general area.
3. These values were obtained using online seismic design maps and tools available on the Applied Technology Council (ATC) website referenced in Section 1613.2.1 of the 2019 OSSC.

Liquefaction

Liquefaction is the phenomenon where saturated soils develop high pore-water pressures during seismic shaking and lose their strength characteristics. This phenomenon generally occurs in areas of high seismicity, where groundwater is shallow and loose granular soils or relatively low- to non-plastic fine-grained soils are present.

Based on their plasticity characteristics, the shallow high-plasticity soils are considered non-liquefiable. Based on their very stiff/dense nature, the underlying residual soil is considered non-liquefiable within the depths explored. In addition, relatively shallow, non-liquefiable basaltic andesite bedrock underlies the site. These findings are consistent with liquefaction hazard mapping for the site described above, which indicates soils at the site are non-liquefiable.

SLOPE STABILITY

Published geologic maps referenced in the attached October 8, 2012, engineering geology report and in the **Engineering Geology Update** section referenced above indicate that shallow surficial landsliding and debris flows are the primary types of slope failure in Newell Creek Canyon. In addition, recent hazard mapping indicates a moderate to high risk of deep-seated failures on the eastern portion of the site. It is our opinion that the previously discussed deep-seated failure of the mapped landslide was due to significant undercutting of lower-strength materials that underly the basalt by the ancestral Newell Creek. The resultant landslide debris covered the lower strength materials, forcing Newell Creek further to the east. In our opinion, the landslide debris and current location of Newell Creek provide a level of protection against erosion of the lower

strength materials, and a reduced risk of deep seated failures for the life of the current development.

Mechanics of Stability

Slope stability analyses take into consideration material strength, presence and orientation of weak layers, water (piezometric) pressures, surcharge loads, and the slope geometry. Mathematical computations are performed using computer-assisted simulations to calculate a Factor of Safety (FS). Minor changes to slope geometry, surface water flow and/or groundwater levels could result in slope instability. Reasonable FS values are dependent upon the confidence in the parameters utilized in the analyses performed, among other factors related to the project itself.

Geometric Analysis Results

Slope stability analyses were performed for the cross-section geometries based on the provided topographic map and publicly available topographic information. Parameters for the analyses were derived from our exploration program, experience, and laboratory tests. Stability analyses were conducted using the computer program Slope/W Version 7.16 developed by Geo-Slope International.

Unstable or Potentially Unstable Slopes

Based on the results of our field investigation, laboratory testing program, and geotechnical analysis, development of the site is considered feasible from a geotechnical viewpoint provided the conclusions and considerations provided herein are incorporated into the design and construction of the project. A horizontal acceleration of 0.225 (1/2 of the PGA_M) was entered for the seismic stability calculations.

The stability of the slopes at the cross-section locations shown on **Figure 3 –Exploration Plan East** were analyzed based on the provided topography, proposed grading, soil properties derived from our geotechnical exploration, laboratory test results and our experience with similar soil conditions. Soil and bedrock properties used in the analyses are shown below:

Material	Moist Unit Weight (pcf)	Drained Cohesion (psf)	Drained Friction Angle (degrees)
Existing Fill	120	0	27
Proposed Fill	125	0	32
Probable Slide Material	120	100	5
Residual Soil	125	250	30
Fresh Bedrock	150	500	45

Based on the analyses, the calculated FS for the critical surface identified in each section is shown below. It's important to note that these results incorporate the planned grading at this time. However, these analyses do not include any risk mitigation elements recommended later in this section.

Cross-Section	Minimum Calculated Factor-of-Safety for Slopes With Proposed Grading (no mitigation)	
	Static	Seismic
A-A'	1.65	1.06
B-B'	1.36	0.81
C-C'	1.91	1.17

The typically accepted minimum FS for static long-term slope stability supporting improvements is 1.5, and 1.15 for seismic slope stability. As shown in the table above, the proposed fill placement at the top of the slope will result in a factor of safety below the accepted minimums.

Slope Hazard Mitigation Recommendations

We evaluated multiple slope stability mitigation options including the use us deep foundations to support the proposed parking areas, the use of lightweight fill materials, and incorporating geogrid into the new structural fill areas. Based on our analyses, we recommend the proposed retaining wall incorporate a row of soldier piles to reinforce the top of the slope. The soldier piles should consist of a row of drilled shaft cast-in-place concrete piers. In addition, we recommend buildings setback a minimum of 35 feet from the top of the headscarp at the east end of the site. This line is shown on the attached **Figure 9 - Reconnaissance Map** and **Figure 3 - Exploration Plan East**. These piles should be embedded a minimum of 5 feet into the bedrock materials. Additional discussion of these recommendations is provided in **Geotechnical Overview** section. Details of the pile recommendations are provided in the **Soldier Pile Walls** section.

Incorporating these recommendations into the slope stability analyses results in the following calculated FS for the critical surfaces:

Cross-Section	Minimum Calculated Factor-of-Safety for Slopes Mitigated with Soldier Piles	
	Static	Seismic
A-A'	2.48	1.61
B-B'	2.87	1.56
C-C'	2.80	1.75

While these factors of safety appear significantly higher than the goal of design of 1.5 for static and 1.15 for seismic, these are the minimums provided the piles are embedded into the bedrock. Our analyses for piles not embedded into the bedrock did not achieve adequate factors of safety. As indicated in the preceding table, installation of soldier piles will provide sufficient increase in

the factors of safety. The slope stability results for each cross section representing the proposed grading incorporating soldier piles are included as **Figures 13 through 18** in the **Figures** section of this report.

GEOTECHNICAL OVERVIEW

Based on the results of our slope stability and engineering analyses, it is our opinion that the proposed development is feasible from the geotechnical engineering standpoint. The primary geotechnical considerations for development of the site are:

- **Existing Landslide Hazard:** As indicated above, we recommend the retaining wall at the east end of the site incorporate a row of soldier piles to aid in slope stability. The soldier piles should consist of drilled shaft cast-in-place concrete piers that are designed to provide lateral support for new fill and existing native soils (above the bedrock) west of the proposed retaining wall. Soldier pile recommendations are provided in the **Soldier Pile Walls** section. In addition, we recommend a 35-foot building setback from the top of the descending slope at the east end of the site (See **Figure 3 - Exploration Plan East**). The recommended setback is for habitable structures, so minor encroachments of parking and grading can be considered an acceptable use provided the following considerations are incorporated into final grading plans in order to minimize impact to slope stability:
  - Drainage should be controlled so that no water is discharged onto or over the descending slope.
  - Additional area loading of the top of the slope should be avoided (i.e. no additional fill that would increase weight at the top of the slope beyond that included in our slope stability model as shown on the proposed grading plan and cross sections).

- **Existing Fill Pad:** Up to about 7 feet of undocumented fill soils underlie the proposed parking and drive lane area at the east end of the site. “Undocumented” fill is fill that lacks documentation regarding its subgrade conditions or evaluation of compaction while it was placed. Due to the potential of long-term settlement of such fill, we recommend the fill be removed and replaced with properly placed and compacted structural fill as described in the **Earthwork** section. The approximate area of the fill (based on topography) is shown on **Figure 8 - Topographic Map**.

- **Previous Tank Excavations:** Several underground storage tanks related to a former gas station were removed from within the southwest corner of the site in the parking area southwest of southern building pad fronting on Molalla Avenue. The approximate location of the former gas station is shown on the **Figure 8 - Topographic Map**. We are not aware of density test or observation reports regarding the placement of backfill within the excavations remaining after removal of the tanks. Therefore, we recommend the fill be treated as “undocumented,” and that it be removed and replaced with properly placed and compacted

structural fill. The suitability of existing fill for reuse as structural fill can be evaluated during construction. As an alternative, additional test pits could be advanced into the existing fill to determine if it can be reused as structural fill.

- **Moisture Sensitivity:** The near surface, silt soils could become unstable with typical earthwork and construction traffic, especially after precipitation events. The effective drainage should be completed early in the construction sequence and maintained after construction to avoid potential issues. If possible, the grading should be performed during the warmer and drier times of the year. If grading is performed during the winter months, an increased risk for possible undercutting and replacement of unstable subgrade will persist. Additional site preparation recommendations, including subgrade improvement and fill placement, are provided in the **Earthwork** section.

The **General Comments** section provides an understanding of the report limitations.

EARTHWORK

Earthwork is anticipated to include demolition, clearing and grubbing, excavations, and fill placement. The following sections provide recommendations for use in the preparation of specifications for the work. Recommendations include critical quality criteria, as necessary, to render the site in the state considered in our geotechnical engineering evaluation for foundations, floor slabs, and pavements.

Site Preparation

Prior to placing new fill, existing vegetation and root mat should be removed. Complete stripping of the topsoil should be performed in the proposed building and parking/driveway areas. Existing pavements, foundations, subsurface structures, and utilities remaining from previous development should be removed in their entirety. Existing fill soils should be removed and replaced with controlled structural fill.

The subgrade should be proof rolled with an adequately loaded vehicle such as a fully-loaded tandem-axle dump truck. The proof rolling should be performed under the direction of the Geotechnical Engineer. Areas excessively deflecting under the proof roll should be delineated and subsequently addressed by the Geotechnical Engineer. Such areas should either be removed or modified by stabilizing with cement. Excessively wet or dry material should either be removed or moisture conditioned and recompacted.

Terracon completed an Environmental Site Assessment (ESA) report for the project under separate cover. The ESA indicates contaminated soils within portions of the former wrecking yard at the east end of the site near the top of the descending slope. Any contaminated soils removed

near the top of the descending slope during remediation practices should be replaced with properly controlled, low-permeability structural fill soils. A former fueling station was also identified on the western portion of the site. We understand that the fuel tank was previously removed and the resulting excavation was loosely backfilled with excavated soils. The contractor should be aware that earthwork activities associated with the proposed development may encounter contaminated native and/or undocumented fill soils within these areas. The ESA reports completed for the site should be thoroughly reviewed prior to the start of earthwork activities.

Existing Fill

As noted in **Geotechnical Characterization**, many of the explorations encountered existing fill to depths of up to about 7 feet. The consistency/density of the fill is highly variable. Therefore, we recommend the fill be completely removed and replaced with properly placed and compacted structural fill in proposed building and pavement areas. Removal of undocumented fill soils should extend a minimum of 10 feet beyond building and pavement areas. Once materials have been removed, the entire area should be proof rolled with heavy, rubber tire construction equipment, to aid in delineating areas of soft or otherwise unsuitable soil. Areas of soft or otherwise unsuitable material should be undercut and replaced with either new structural fill or suitable, existing on site materials. Once unsuitable materials have been remediated, and the subgrade has passed the proof roll test, the existing and undocumented fill that was removed can be evaluated for reuse as structural fill.

Subgrade Stabilization

For this site, improvement of working surfaces subgrade with Portland cement could be considered. Cement amendment of soils should be performed by a pre-qualified contractor having experience with successfully stabilizing subgrades in the project area on similar sized projects with similar soil conditions.

For planning purposes, we estimate that pavement subgrades would need to be amended with an approximate 7 to 8 percent cement by dry weight in order to provide a stabilized subgrade for both wet weather and pavement support. We recommend a cement-amendment design be prepared during the full design phase to refine this estimate for construction specifications.

Fill Material Types

Fill required to achieve design grades should be classified as select fill, structural fill and general fill. Select fill is material used below turbine foundations, whereas structural fill is material used above or within 10 feet of foundation structures and within roadways or constructed slopes. General fill is material used to achieve grade outside of these structural areas. Fill materials used should meet the following material property requirements:

Soil Type[1]	Specification	Acceptable Parameters (for Structural Fill)
Common Fill	2021 ODOT Standard Specifications for Construction (ODOT SSC) Section 00330.13 Selected General Backfill[2]	All locations across the site, except beneath footing pads Dry weather only
Granular Common Fill	ODOT SSC Section 0030.13 Selected General Backfill[3]	All locations across the site. Dry weather only
Select Fill	ODOT SSC Section 00330.14 Selected Granular Backfill[4]	All locations across the site. Wet and Dry weather acceptable.
Crushed Aggregate Base (CAB)	ODOT SSC Section 02630.10 Dense Graded Aggregate (2”-0 to 1”-0) with the modification that less than 8% pass the No. 200 sieve as determined by ASTM D 422.	Finished base course materials for roadways and footing subgrades.
Lean Concrete (Mud-Mat)	ODOT SSC 00442 with the exception that minimum 28-day strength shall be 500 psi. Higher strength minimums may be specified by the Structural Engineer as needed.	All locations underneath mat foundations and spread foundations.

1. Controlled, compacted fill should consist of approved materials that are free (free = less than 3% by weight) of organic matter and debris (i.e. wood sticks greater than ½ inch in diameter). Frozen material should not be used, and fill should not be placed on a frozen subgrade. A sample of each material type should be submitted to the geotechnical engineer for evaluation.
2. Material should have a liquid limit less than 40 and plasticity index of less than 10.
3. Material should have less than 50% passing the No. 200 sieve and be non-plastic in nature.
4. Material should have a maximum aggregate size of 2 inches and no more than 8% passing the No. 200 sieve by weight determined by ASTM D 422.
5. Decomposed bedrock and basalt bedrock can be used as fill/backfill provided it is properly processed to a “soil-like consistency” to meet the USCS Classifications presented above with no pieces larger than 2 inches.
6. The contractor shall select the appropriate material for use based on the current and forecasted weather conditions at the time of construction.

Fill Compaction Requirements

Recommended compaction and moisture content criteria for structural fill materials are as follows:

Material Type and Location	Minimum Compaction Requirement (%)	Range of Moisture Contents for Compaction	
		Minimum	Maximum
Common Fill	**Per the Modified Proctor Test (ASTM D 1557)**		
All locations where used	95	-2%	+2%
Select Fill & CAB	**Per the Modified Proctor Test (ASTM D 1557)**		

Material Type and Location	Minimum Compaction Requirement (%)	Range of Moisture Contents for Compaction	
		Minimum	Maximum
All locations where used (e.g. beneath foundations, slabs, pavements)	95	-4%	+2%

Utility Trench Backfill

For low permeability subgrades, utility trenches are a common source of water infiltration and migration. Utility trenches penetrating beneath the buildings should be effectively sealed to restrict water intrusion and flow through the trenches, which could migrate below the buildings. The trench should provide an effective trench plug that extends at least 5 feet from the face of building exteriors. The plug material should consist of cementitious flowable fill or low permeability clay. The trench plug material should be placed to surround the utility line. If used, the clay trench plug material should be placed and compacted to comply with the water content and compaction recommendations for structural fill stated previously in this report.

Grading and Drainage

All grades must provide effective drainage away from the buildings during and after construction and should be maintained throughout the life of the structure. Water retained next to the buildings can result in soil movements greater than those discussed in this report. Greater movements can result in unacceptable differential floor slab and/or foundation movements, cracked slabs and walls, and roof leaks. The roofs should have gutters/drains with downspouts that discharge onto splash blocks at a distance of at least 10 feet from the buildings.

Exposed ground should be sloped and maintained at a minimum 5% away from the buildings for at least 10 feet beyond the perimeter of the buildings. Locally, flatter grades may be necessary to transition ADA access requirements for flatwork. After building construction and landscaping have been completed, final grades should be verified to document effective drainage has been achieved. Grades around the structure should also be periodically inspected and adjusted, as necessary, as part of the structure's maintenance program. Where paving or flatwork abuts the structure, a maintenance program should be established to effectively seal and maintain joints and prevent surface water infiltration.

Earthwork Construction Considerations

Shallow excavations for the proposed structures are anticipated to be accomplished with conventional construction equipment. Upon completion of filling and grading, care should be taken to maintain the subgrade water content prior to construction of floor slabs. Construction traffic over the completed subgrades should be avoided. The site should also be graded to prevent ponding of surface water on the prepared subgrades or in excavations. Water collecting over or

adjacent to construction areas should be removed. If the subgrade freezes, desiccates, saturates, or is disturbed, the affected material should be removed, or the materials should be scarified, moisture conditioned, and recompacted prior to floor slab construction.

As a minimum, excavations should be performed in accordance with OSHA 29 CFR, Part 1926, Subpart P, “Excavations” and its appendices, and in accordance with any applicable local, and/or state regulations.

Construction site safety is the sole responsibility of the contractor who controls the means, methods, and sequencing of construction operations. Under no circumstances shall the information provided herein be interpreted to mean Terracon is assuming responsibility for construction site safety, or the contractor's activities; such responsibility shall neither be implied nor inferred.

Construction Observation and Testing

The earthwork efforts should be monitored under the direction of the Geotechnical Engineer. Monitoring should include documentation of adequate removal of vegetation and topsoil, proof rolling, and mitigation of areas delineated by the proof roll to require mitigation.

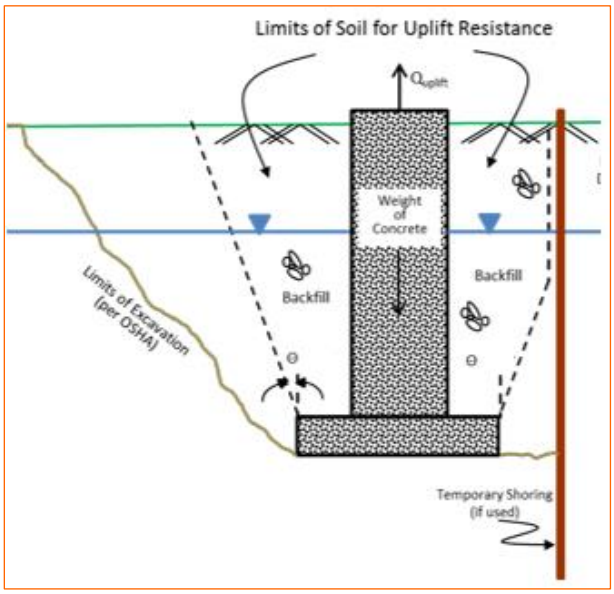
Each lift of compacted fill should be tested, evaluated, and reworked, as necessary, until approved by the Geotechnical Engineer prior to placement of additional lifts. Each lift of fill should be tested for density and water content at a frequency of at least one test for every 2,500 square feet of compacted fill in the building areas and 5,000 square feet in pavement areas. One density and water content test should be performed for every 50 linear feet of compacted utility trench backfill. In areas of foundation excavations, the bearing subgrade should be evaluated under the direction of the Geotechnical Engineer. If unanticipated conditions are encountered, the Geotechnical Engineer should prescribe mitigation options.

In addition to the documentation of the essential parameters necessary for construction, the continuation of the Geotechnical Engineer into the construction phase of the project provides the continuity to maintain the Geotechnical Engineer’s evaluation of subsurface conditions, including assessing variations and associated design changes.

SHALLOW FOUNDATIONS

If the site has been prepared in accordance with the requirements noted in the **Earthwork** section, the following design parameters are applicable for shallow foundations.

Design Parameters – Compressive Loads

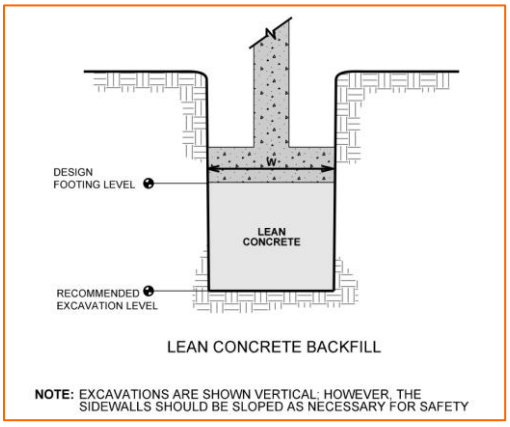


Item	Description
Maximum Net Allowable Bearing Pressure[1,2]	2,000 psf
Required Bearing Stratum[3]	Structural fill or undisturbed native residual soil
Minimum Foundation Dimensions	Columns: 24 inches Continuous: 18 inches
Ultimate Passive Resistance[4] **(equivalent fluid pressures)**	150 pcf (cohesive backfill) 360 pcf (granular backfill)
Ultimate Coefficient of Sliding Friction[5]	0.30 (native silt soils) 0.50 (granular structural fill material)
Minimum Embedment below Finished Grade[6]	Exterior footings in unheated areas: 12 inches Exterior footings in heated areas: 12 inches Interior footings in heated areas: 12 inches
Estimated Total Settlement from Structural Loads[2]	Less than about 1 inch
Estimated Differential Settlement[2,7]	About ⅔ of total settlement

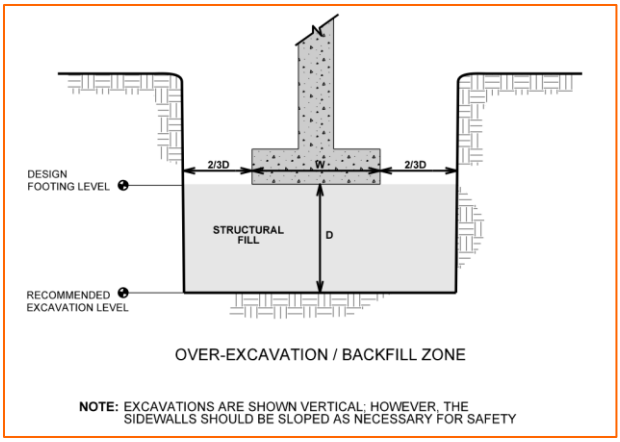
1. The maximum net allowable bearing pressure is the pressure in excess of the minimum surrounding overburden pressure at the footing base elevation. An appropriate factor of safety has been applied. Values assume that exterior grades are no steeper than 20% within 10 feet of structure.
2. Values provided are for maximum loads noted in **Project Description**.
3. Unsuitable or soft soils should be overexcavated and replaced per the recommendations presented in the **Earthwork**.
4. Use of passive earth pressures require the sides of the excavation for the spread footing foundation to be nearly vertical and the concrete placed neat against these vertical faces or that the footing forms be removed and compacted structural fill be placed against the vertical footing face.
5. Can be used to compute sliding resistance where foundations are placed on suitable soil/materials. Should be neglected for foundations subject to net uplift conditions.
6. Embedment necessary to minimize the effects of frost and/or seasonal water content variations. For sloping ground, maintain depth below the lowest adjacent exterior grade within 5 horizontal feet of the structure.
7. Differential settlements are as measured over a span of 50 feet.

Design Parameters - Uplift Loads

Uplift resistance of spread footings can be developed from the effective weight of the footing and the overlying soils. As illustrated on the subsequent figure, the effective weight of the soil prism defined by diagonal planes extending up from the top of the perimeter of the foundation to the ground surface at an angle, θ, of 20 degrees from the vertical can be included in uplift resistance. The maximum allowable uplift capacity should be taken as a sum of the effective weight of soil plus the dead weight of the foundation, divided by an appropriate factor of safety. A maximum



total unit weight of 100 pcf should be used for the backfill. This unit weight should be reduced to 40 pcf for portions of the backfill or natural soils below the groundwater elevation.



Foundation Construction Considerations

As noted in **Earthwork**, the footing excavations should be evaluated under the direction of the Geotechnical Engineer. The base of all foundation excavations should be free of water and loose soil, prior to placing concrete. Concrete should be placed soon after excavating to reduce bearing soil disturbance. Care should be taken to prevent wetting or drying of the bearing materials during construction. Excessively wet or dry material or any loose/disturbed material in the bottom of the footing excavations should be removed/reconditioned before foundation concrete is placed.

If unsuitable bearing soils are encountered at the base of the planned footing excavation, the excavation should be extended deeper to suitable soils, and the footings could bear directly on these soils at the lower level or on lean concrete backfill placed in the excavations. This is illustrated on the sketch below.

Overexcavation for structural fill placement below footings should be conducted as shown below. The overexcavation should be backfilled up to the footing base elevation, with structural fill placed, as recommended in the **Earthwork** section.

FLOOR SLABS

Depending upon the finished floor elevation, unsuitable, undocumented fills may be encountered at the floor slab subgrade levels. These soils should be replaced with structural fill so the floor slab is supported on suitable natural soils or newly placed structural fill.

Design parameters for floor slabs assume the requirements for **Earthwork** have been followed. Specific attention should be given to positive drainage away from the structure and positive drainage of the aggregate base beneath the floor slab.

Floor Slab Design Parameters

Item	Description
Floor Slab Support [1]	Minimum 6 inches of free-draining (less than 6% passing the U.S. No. 200 sieve) crushed aggregate compacted to at least 95% of ASTM D 698 [2, 3]
Estimated Modulus of Subgrade Reaction [2]	100 pounds per square inch per inch (psi/in) for point loads

1. Floor slabs should be structurally independent of building footings or walls to reduce the possibility of floor slab cracking caused by differential movements between the slab and foundation.
2. Modulus of subgrade reaction is an estimated value based upon our experience with the subgrade condition, the requirements noted in **Earthwork**, and the floor slab support as noted in this table. It is provided for point loads. For large area loads the modulus of subgrade reaction would be lower.
3. Free-draining granular material should have less than 5% fines (material passing the No. 200 sieve). Other design considerations such as cold temperatures and condensation development could warrant more extensive design provisions.

The use of a vapor retarder should be considered beneath concrete slabs on grade covered with wood, tile, carpet, or other moisture sensitive or impervious coverings, or when the slab will support equipment sensitive to moisture. When conditions warrant the use of a vapor retarder, the slab designer should refer to ACI 302 and/or ACI 360 for procedures and cautions regarding the use and placement of a vapor retarder.

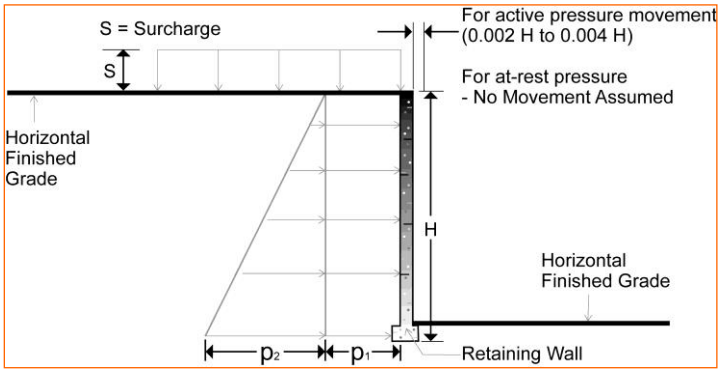
Saw-cut control joints should be placed in the slab to help control the location and extent of cracking. For additional recommendations refer to the ACI Design Manual. Joints or cracks should be sealed with a water-proof, non-extruding compressible compound specifically recommended for heavy duty concrete pavement and wet environments.

Where floor slabs are tied to perimeter walls or turn-down slabs to meet structural or other construction objectives, our experience indicates differential movement between the walls and slabs will likely be observed in adjacent slab expansion joints or floor slab cracks beyond the length of the structural dowels. The Structural Engineer should account for potential differential settlement through use of sufficient control joints, appropriate reinforcing or other means.

Mitigation measures, as noted in **Existing Fill** within the **Earthwork** section, are critical to the performance of floor slabs. In addition to the mitigation measures, the floor slab can be stiffened by adding steel reinforcement, grade beams and/or post-tensioned elements.

Floor Slab Construction Considerations

Finished subgrade, within and for at least 10 feet beyond the floor slab, should be protected from traffic, rutting, or other disturbance and maintained in a relatively moist condition until floor slabs are constructed. If the subgrade should become damaged or desiccated prior to construction of floor



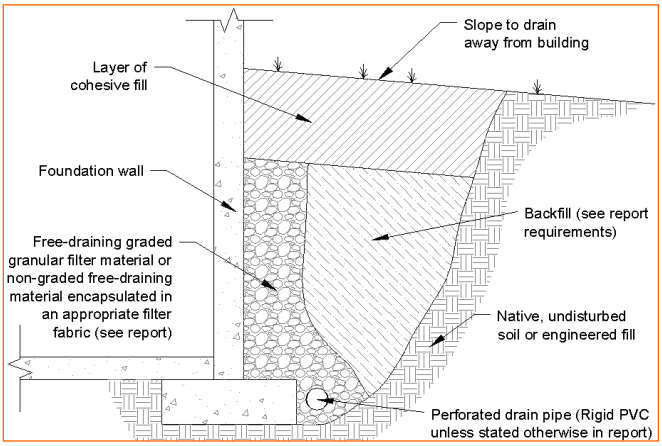
slabs, the affected material should be removed and structural fill should be added to replace the resulting excavation. Final conditioning of the finished subgrade should be performed immediately prior to placement of the floor slab support course.

The Geotechnical Engineer should approve the condition of the floor slab subgrades immediately prior to placement of the floor slab support course, reinforcing steel, and concrete. Attention should be paid to high traffic areas that were rutted and disturbed earlier, and to areas where backfilled trenches are located.

LATERAL EARTH PRESSURES

Design Parameters

Structures with unbalanced backfill levels on opposite sides should be designed for earth pressures at least equal to values indicated in the following table. Earth pressures will be influenced by structural design of the walls, conditions of wall restraint, methods of construction and/or compaction and the strength of the materials being restrained. Two wall restraint conditions are shown in the diagram below. Active earth pressure is commonly used for design of free-standing cantilever retaining walls and assumes wall movement. The “at-rest” condition assumes no wall movement and is commonly used for basement walls, loading dock walls, or other walls restrained at the top. The recommended design lateral earth pressures do not include a factor of safety and do not provide for possible hydrostatic pressure on the walls (unless stated).



Lateral Earth Pressure Design Parameters				
Earth Pressure Condition [1]	Coefficient for Select Fill Backfill [2]	Surcharge Pressure [3, 4, 5] p_1 (psf)	Effective Fluid Pressures (psf) [2, 4, 5]	
			Unsaturated [6]	Submerged [6]
Active (Ka)	0.31	(0.27)S	(35)H	0.27
At-Rest (Ko)	0.47	(0.43)S	(55)H	0.43
Passive (Kp)	3.25	---	(480)H	3.69

1. For active earth pressure, wall must rotate about base, with top lateral movements 0.002 H to 0.004 H, where H is wall height. For passive earth pressure, wall must move horizontally to mobilize resistance.
2. Uniform, horizontal backfill, compacted to at least 95% of the ASTM D 1557 maximum dry density, rendering a maximum unit weight of 120 pcf.
3. Uniform surcharge, where S is surcharge pressure.
4. Loading from heavy compaction equipment is not included.
5. No safety factor is included in these values.
6. To achieve “Unsaturated” conditions, follow guidelines in Subsurface Drainage for Below-Grade Walls section below. “Submerged” conditions are recommended when drainage behind walls is not incorporated into the design.

Backfill placed against structures should consist of granular soils or low plasticity cohesive soils. For the granular values to be valid, the granular backfill must extend out and up from the base of the wall at an angle of at least 45 and 60 degrees from vertical for the active and passive cases, respectively.

Subsurface Drainage for Below-Grade Walls

A perforated rigid plastic drain line installed behind the base of walls and extends below adjacent grade is recommended to prevent hydrostatic loading on the walls. The invert of a drain line around a below-grade building area or exterior retaining wall should be placed near foundation bearing level. The drain line should be sloped to provide positive gravity drainage to daylight or to a sump pit and pump. The drain line should be surrounded by clean, free-draining granular material having less than 5% passing the No. 200 sieve, such as No. 57 aggregate. The free-draining aggregate should be encapsulated in a filter fabric. The granular fill should extend to within 2 feet of final grade, where it should be capped with compacted cohesive fill to reduce infiltration of surface water into the drain system.

As an alternative to free-draining granular fill, a pre-fabricated drainage structure may be used. A pre-fabricated drainage structure is a plastic drainage core or mesh which is covered with filter fabric to prevent soil intrusion, and is fastened to the wall prior to placing backfill.

SOLDIER PILE WALLS

Based on the slope stability analyses and the proposed development plan, we recommend that the retaining wall along the east end of the proposed fill pad be supported on deep foundations consisting of a row of cast in place concrete piles. Based on our analyses, the piles should be spaced no more than 8 feet apart. The piles should be embedded a minimum of 5 feet into the basalt bedrock encountered at the site, and should be designed to retain the proposed structural fill (under the parking and drive lanes), and underlying native residual soils to the surface of the bedrock. Based on our explorations, the surface of the bedrock ranges from about 20 to 33 feet below site grades along the wall alignment. This depth will likely have more variation during construction to the variable thickness of the fill present at the site.

Lateral Earth Pressures

Based on slope stability analyses attached to this report, we recommend the piles be designed to retain the soils from the proposed finished grade to the surface of the basalt bedrock. The parameters defined in the table below should be utilized in the design of the drilled shafts to determine required embedment depth and spacing, taking into consideration a minimum spacing between piles of 8 feet along the top of the slope and a minimum embedment of 5 feet into the bedrock. Additional embedment into the bedrock may be necessary to provide adequate resistance to overturning.

The design of lateral earth stabilization piers is conventionally accomplished using empirical relationships and apparent earth pressure distributions. These earth pressure distributions or envelopes do not represent the precise distribution of earth pressures but rather constitute

hypothetical pressures from loads can be calculated which would not likely be exceeded in the event of a landslide.

Design of these systems could be based on either “active” or “at-rest” lateral earth pressures, depending on the degree of deformation that can be tolerated. Piers which are free to deform on the order of 0.001 to 0.002 times the height of the exposed potential height is considered to be capable of mobilizing active earth pressures. This lateral deformation is likely to be accomplished by vertical settlement of up to roughly 0.002 times the height of the piers, which may extend back from the side of the slide face a distance equal to roughly the height of the exposed height. A greater amount of lateral deformation could allow greater vertical settlements. Since there are structural elements within the zone considered to be at risk during a potential slide, we believe it is appropriate to design utilizing at-rest earth pressures.

An assumed “at-rest” earth pressure condition theoretically assumes no movement of the soil behind the stabilization piers; however, some settlement should realistically be anticipated due to construction practices and/or the fact that it is not possible to construct a perfectly stiff system and the space between the piers are reliant on soil arching for support should be piers be exposed.

Material	Equivalent Fluid Weight		Strength Parameters (Drained)	
	At Rest (pcf)	Allowable Passive (pcf)	Drained Cohesion (psf)	Drained Friction Angle (degrees)
Existing Fill	120	320	0	27
Proposed Fill	125	407	0	32
Residual Soil	125	375	250	30
Fresh Bedrock	150	874	500	45

In the table above, the at-rest pressures act on the pile spacing above the bedrock and on the pier diameter below that depth. The passive pressures act on twice the pier diameter. We recommend a minimum pier embedment of at least 5 feet into competent basalt bedrock.

Construction Considerations

If soldier piles are installed prior to removal of the existing debris-laden undocumented fill, caving conditions should be expected in the fill materials. Therefore, drilled shaft excavations may require the use of temporary casing and drilling fluid to maintain integrity of the excavation walls and bottom. Groundwater was not encountered within the anticipated depth of drilling, but isolated perched zones may be encountered within the residual soil or at the top of the underlying bedrock, particularly following periods of heavy rainfall. Thick drilling fluid and/or casing may be required to offset the groundwater and caving conditions. Following completion of the excavation and prior

to installing reinforcement or concrete the bottom of the shaft must be cleaned of any soft or loose material.

Caving of the sidewalls and/or heaving of the shaft bottoms may occur during wet weather conditions. We recommend that the contractor be prepared to use casing and/or slurry installation methods in the event that wall sloughing, caving, or heave occurs. The contractor should also be equipped to clean out the bottom of the shafts if loose soil is observed or suspected.

If less than 3 inches of water is present in the bottom of the excavation, groundwater seepage into the excavation is at a rate of no more than 12 inches per hour and the shaft diameter is greater than or equal to 3 feet; concrete may be placed by free-fall. Under free-fall placement, deposit concrete through the center of the reinforcement cage by a method which prevents segregation of aggregates and splashing of concrete on the reinforcement cage. Place concrete so that the free-fall is vertical down the center of the shaft without hitting the sides, the steel reinforcing bars or steel cage bracing.

If the drilled shaft does not meet the above requirements, we recommend placing concrete from the bottom of the holes with a tremie pipe to form a continuous column and prevent aggregate separation. Concrete should be placed with a higher than average slump into the excavation through a tremie pipe extending to the bottom of the excavation. An uninterrupted supply and placement of concrete should be performed to produce a monolithic pier. Use clean, watertight tremie pipes large enough in diameter to allow the free flow of concrete. The tremie pipes should be placed within one to two feet above the bottom of the excavation prior to the commencement of concrete placement. Maintain a minimum 5 feet embedment of the tremie pipe in the concrete during concrete placement.

The bottom of the shaft must be observed or tested to verify that all loose material has been removed and dense granular soil is exposed. The contractor should review the conditions encountered and reported on the boring logs and in this report and provide appropriate equipment to excavate the shafts to the design depths at this site.

Reinforcing steel and concrete should be placed inside the temporary casing. The casing should be pulled as the concrete is placed to provide final contact between the soil and the concrete. A minimum head of 5 feet of concrete should be maintained above the lower edge of the casing as it is pulled to prevent intrusion of soil during extraction.

PAVEMENTS

General Pavement Comments

Pavement designs are provided for the traffic conditions and pavement life conditions as noted in **Project Description** and in the following sections of this report. A critical aspect of pavement performance is site preparation. Pavement designs noted in this section must be applied to the site which has been prepared as recommended in the **Earthwork** section.

Pavement Design Parameters

Design of Asphaltic Concrete (AC) pavements are based on the procedures outlined in the American Association of State Highway and Transportation Officials (AASHTO), 1993. Design of Portland Cement Concrete (PCC) pavements are based upon American Concrete Institute (ACI) 330; Guide for Design and Construction of Concrete Parking Lots.

A subgrade CBR of 9 (from attached laboratory testing) was used for the AC pavement designs, and a modulus of subgrade reaction (k) of 100 pci was used for the PCC pavement designs where subgrade stabilization consisting of CAB or cement treated soil is employed. The values were empirically derived based upon our experience with the fine-grained subgrade soils and our understanding of the quality of the subgrade as prescribed by the **Site Preparation** conditions as outlined in **Earthwork**. A modulus of rupture of 580 psi was used for pavement concrete.

Pavement Section Thicknesses with Subgrade Stabilization

As a minimum, we suggest the following pavement section be considered:

Asphaltic Concrete Design		
Layer	Thickness (inches)	
	Light Duty [1]	Heavy Duty [1]
AC [2]	3	4
Aggregate Base [3]	7	8

1. See **Project Description** for more specifics regarding Light Duty and Medium Duty traffic.
2. All materials should meet the Oregon Department of Transportation (ODOT) Standard Specifications for Construction (2018).
   - Asphaltic Surface - ODOT Type A Asphaltic Cement Concrete: Section 00744
   - Asphaltic Base - ODOT Type B Asphaltic Cement Concrete, Class I: Section 00745
3. A minimum 1.5-inch surface course should be used on ACC pavements.

Portland Cement Concrete Design		
Layer	Thickness (inches)	
	Light Duty [1]	Heavy Duty [3]
PCC [2]	5	6
Aggregate Base [3]	7	8

1. See **Project Description** for more specifics regarding traffic classifications.
2. All materials should meet the current State Department of Transportation ODOT) Standard Specifications for Highway and Construction (2018).
   - Concrete Pavement - ODOT Portland Cement Concrete Type C: Section 00756
3. In areas of anticipated heavy traffic, fire trucks, delivery trucks, or concentrated loads (e.g. dumpster pads), and areas with repeated turning or maneuvering of heavy vehicles.

We understand that typical fire departments require that the proposed pavement sections at the site will support a fire emergency truck once the apartment complex is constructed. Typically, we estimate total fire-truck load of 80,000 pounds for a three axle (single tire) truck. Based on these assumptions and the proposed loading conditions, we computed the ultimate bearing capacity of the pavement sections relative to a 20 percent increase of the factored load of the fire truck. From a bearing failure standpoint, the Truck Loading Section pavements are estimated to be adequate for support of the fire truck vehicle (with a factor of safety of 2.5). Pavement areas may experience some localized cracking from these large fire truck vehicle loads but are not expected to experience bearing failure of the pavement section. Based on this analysis, it is our opinion that pavement will provide adequate support for the temporary use of an emergency fire truck at the site.

Pavement Drainage

Pavements should be sloped to provide rapid drainage of surface water. Water allowed to pond on or adjacent to the pavements could saturate the subgrade and contribute to premature pavement deterioration. In addition, the pavement subgrade should be graded to provide positive drainage within the granular base section. The subgrade and the pavement surface should have a minimum ¼ inch per foot slope to promote drainage. Appropriate sub-drainage or connection to a suitable daylight outlet should be provided to remove water from the base layer.

Pavement Maintenance

The pavement sections represent minimum recommended thicknesses and, as such, periodic maintenance should be anticipated. Therefore, preventive maintenance should be planned and provided for through an on-going pavement management program. Maintenance activities are intended to slow the rate of pavement deterioration and to preserve the pavement investment. Maintenance consists of both localized maintenance (e.g., crack and joint sealing and patching) and global maintenance (e.g., surface sealing). Preventive maintenance is usually the priority when implementing a pavement maintenance program. Additional engineering observation is

recommended to determine the type and extent of a cost-effective program. Even with periodic maintenance, some movements and related cracking may still occur and repairs may be required. Pavement performance is affected by its surroundings. In addition to providing preventive maintenance, the civil engineer should consider the following recommendations in the design and layout of pavements:

- Final grade adjacent to paved areas should slope down from the edges at a minimum 2%.
- Subgrade and pavement surfaces should have a minimum 2% slope to promote proper surface drainage.
- Install below pavement drainage systems surrounding areas anticipated for frequent wetting.
- Install joint sealant and seal cracks immediately.
- Seal all landscaped areas in or adjacent to pavements to reduce moisture migration to subgrade soils.
- Place compacted, low permeability backfill against the exterior side of curb and gutter.
- Place curb, gutter and/or sidewalk directly on clay subgrade soils rather than on unbound granular base course materials.

GENERAL COMMENTS

Our analysis and opinions are based upon our understanding of the project, the geotechnical conditions in the area, and the data obtained from our site exploration. Natural variations will occur between exploration point locations or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. Terracon should be retained as the Geotechnical Engineer, where noted in this report, to provide observation and testing services during pertinent construction phases. If variations appear, we can provide further evaluation and supplemental recommendations. If variations are noted in the absence of our observation and testing services on-site, we should be immediately notified so that we can provide evaluation and supplemental recommendations.

Our Scope of Services does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

Our services and any correspondence or collaboration through this system are intended for the sole benefit and exclusive use of our client for specific application to the project discussed and are accomplished in accordance with generally accepted geotechnical engineering practices with no third-party beneficiaries intended. Any third-party access to services or correspondence is solely for information purposes to support the services provided by Terracon to our client. Reliance upon the services and any work product is limited to our client, and is not intended for

third parties. Any use or reliance of the provided information by third parties is done solely at their own risk. No warranties, either express or implied, are intended or made.

Site characteristics as provided are for design purposes and not to estimate excavation cost. Any use of our report in that regard is done at the sole risk of the excavating cost estimator as there may be variations on the site that are not apparent in the data that could significantly impact excavation cost. Any parties charged with estimating excavation costs should seek their own site characterization for specific purposes to obtain the specific level of detail necessary for costing. Site safety, and cost estimating including, excavation support, and dewatering requirements/design are the responsibility of others. If changes in the nature, design, or location of the project are planned, our conclusions and recommendations shall not be considered valid unless we review the changes and either verify or modify our conclusions in writing.

Terracon Project No. 82125030

Dear Mr. Vanderdasson:

Terracon Consultants, Inc. (Terracon) is pleased to present our *Preliminary Engineering Geology and Soil Engineering Report* for the Proposed Retail Development project in Oregon City, Oregon. Our services were completed in general accordance with our *Proposal for Geotechnical Engineering Services – Revised* (P82110035R1), dated July 20, 2012. Email authorization to proceed with our services was provided by PACLAND on July 20, 2012. This report presents our preliminary conclusions regarding the stability of the slopes and soils from the proposed development.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report, or if we may be of further service, please contact us.

Sincerely,
Terracon Consultants, Inc.

APPENDIX A – EXHIBITS

Exhibit A-1	Site Plan
Exhibit A-2	Landslide Map Excerpt
Exhibit A-3	Preliminary Geologic Cross Section
Exhibit A-4	Preliminary Static Slope Stability
Exhibit A-5	Preliminary Seismic Slope Stability

EXECUTIVE SUMMARY

The site's geology and associated geologic hazards were researched with regard to the proposed site development. The preliminary engineering geology and geotechnical considerations associated with the proposed project are summarized below.

- **Existing, Adjacent Landslide Hazards:** The steep slope area to the east is a well-documented landslide hazard area. However, the area immediately adjacent to the site is mapped as an ancient landslide. Recent surface reconnaissance of the steep slope area does not indicate recent movement of the weathered landslide features.

- **Proposed Development Feasibility:** The proposed development is feasible from a geotechnical standpoint provided structures, significant fills, and other loads are located outside a suitable setback. Previous engineering studies established a setback of 35 feet from the top of slope and may be used for planning purposes of the new development.

- **Retaining Walls:** A retaining wall is proposed along the east side of the truck route at the currently proposed 35-foot top of slope setback. Additional engineering design will be necessary for the retaining wall, although our preliminary slope stability models indicate the walls are setback sufficiently from the top of the slope and should not adversely impact the stability of the slope.

- **Site Drainage and Erosion Control:** Surface water should be collected and routed away from the steep slope area. Infiltration facilities should not be implemented due to the potential for the infiltrated water to daylight on the adjacent steep slope areas and decrease slope stability. The area within the setback at the top of the slope may be cleared of invasive vegetation, such as blackberries, and suitably vegetated to reduce erosion towards the steep slope area.

This summary should be used in conjunction with the entire report for design purposes. It should be recognized that details were not included or fully developed in this section, and the report must be read in its entirety for a comprehensive understanding of the items contained herein. The **GENERAL COMMENTS** section should be read for an understanding of the report limitation.

PRELIMINARY ENGINEERING GEOLOGY AND SOIL ENGINEERING REPORT PROPOSED RETAIL DEVELOPMENT MOLALLA AVENUE AND BEAVERCREEK ROAD OREGON CITY, OREGON

Project No. 82125030
October 8, 2012

1.0 INTRODUCTION

In accordance with your request and written authorization, Terracon has completed a Preliminary Engineering Geology and Soil Engineering Evaluation for the proposed retail development in Oregon City, Oregon. Terracon, formerly Zipper Zeman Associates (ZZA), previously completed the following reports:

- Preliminary Results of Slope Stability Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon, by ZZA, dated July 3, 2002.
- Subsurface Exploration and Geotechnical Engineering Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon, by ZZA, dated February 13, 2004.

2.0 PURPOSE AND SCOPE

The purpose of this report is to satisfy the requirement for both a Preliminary Engineering Geology Report and a Preliminary Soil Engineering Report as required by the Oregon City Geologic Hazards Checklist. An updated geotechnical engineering report will be provided at a later date with engineering recommendations to be used for final design of the development.

Our scope of services included a slope reconnaissance, review of previous subsurface boring and test pit explorations, review of published geologic literature, preliminary geotechnical engineering analysis, and preparation of this report.

3.0 PROJECT INFORMATION

3.1 Site Location

ITEM	DESCRIPTION
Location	The site is located at the northeast corner of Molalla Avenue and Beavercreek Road in Oregon City, Oregon as shown in Exhibit A-1 – Site Plan.
Existing improvements	The site is currently vacant and fenced off. All former buildings have been razed, although several slab and foundations remain. Several retaining walls and/or slopes on the order of 4 feet or less in height are on the site.
Surroundings	The site is bounded by single and multi-family residences to the north, Molalla Avenue and commercial properties to the west, commercial properties to the south, and an undeveloped steep slope area dropping off to the east.
Current ground cover	The site is covered with grass, shrubs (blackberries, etc.), and scattered to dense stands of trees. The southeast portion of the site is wooded, and the entire south edge of the property is overgrown with dense blackberry shrubs.
Existing topography	The majority of the site is relatively flat with several low retaining walls creating broad terraces stepping down to the east. The eastern edge of the site drops steeply down at inclinations in the range of 1½H:1V to ½H:1V to the east toward Newell Creek. The overall slope system height is on the order of 200 feet in vertical drop. We understand that this steep slope area contains active and ancient landslide complexes and has been studied extensively by Portland State University geologists and other researchers.

3.2 Project Description

ITEM	DESCRIPTION
Structures	Main Retail Building The project will include a new one-story retail building and loading dock with a proposed total footprint of approximately 60,000 square feet (SF). The building footprint is planned in the northeast portion of the site as shown on the attached Site Plan. Outlots 1- 4 Four outlots are currently planned for the western third of the site for three retail buildings ranging from approximately 3,600 SF to 7,200 SF and a one- to two-story commercial/office building of approximately 23,000 SF. Outlot 2 will potentially include a remote drive-thru banking structure.
Building construction	Main Retail Building We have assumed that the store will be constructed with masonry block load-bearing and non-load-bearing walls; steel columns, girders, and joists for support of the roof structure; and on-grade cast-in-place floor slabs. Outlots 1-4 No information is available on the outlot buildings, but we assume they will be either wood-framed or masonry block construction with slab-on-grade floors.
Finished floor elevations	Main Retail Building: Currently planned at elevation 445 feet. Outlot 1: Currently planned at elevation 448 feet. Outlot 2: Currently planned at elevation 444 feet. Outlot 3: Currently planned at elevation 442 feet. Outlot 4: Currently planned at elevation 448 feet.
Maximum loads	Main Retail Building Columns: 85 kips gravity and 150 kips maximum live loading. Walls: 1.5 to 2 klf non-load bearing and 4 to 6 klf for load bearing. Slabs: 125 psf uniform loading and 5-kip concentrated loading max. Outlot Buildings The loads for these buildings are not known at this time, but are assumed to not exceed those listed above for the main retail building.

ITEM	DESCRIPTION
Maximum allowable settlement	Main Retail Building Total Static Settlement: 1 inch Masonry Walls: L/900 or ½ inch over 40 feet Outlots Total Static Settlement: 1 inch (assumed) Differential: L/900 or ½ inch over 40 feet (assumed)
Grading	Significant fills on the order of 10 to 12 feet in maximum thickness are expected on the east half of the site and in the building pad. Excavation cuts (or removal of stockpile areas) up to approximately 10 feet may be needed in the proposed truck route off the southeast corner of the site in the existing stockpile areas.
Cut and fill slopes	3H:1V slopes approximately 4 feet or less in height are expected.
Free-standing retaining walls	An approximately 626-foot long by 5- to 12-foot high retaining wall is planned along the east edge of the truck route outside the steep slope setback. Guards rails and/or fall protection fencing are anticipated atop the retaining walls. Determination of the wall type, e.g., segmental block, soldier pile, etc., has not yet been determined along the east side of the truck route but will be determined as part of the final design to include slope stability concerns.
Below Grade Areas	A loading dock area is planned on the northeast corner of the building with a finish grade of 4 feet below the finish floor elevation.
Stormwater Management	A buried detention structure is planned in the southeast corner of the site under the parking area. We understand that the depth of the structure is currently planned at approximately 7 feet below finish grade.
Off-site Improvements	A public road and truck route is proposed from the southeast corner of the site south to Beavercreek Road.
Buried Utilities	We understand that stormwater and water pipes will run along the truck route on the east side of the site. Depths are anticipated to be 10 feet or less. A sanitary sewer line is proposed to run east-west from Molalla between Outlot 2 and Outlot 3 to the main retail building. The sanitary sewer will also run north-south up the Outlot 2 parking lot north to Outlots 1 and 4. Depths have not been determined yet, but may exceed 10 feet in depth.

4.0 LITERATURE REVIEW

Per Oregon City Municipal Code 17.44.050, we reviewed the following documents for this report:

- The State of Oregon Department of Geology and Mineral Industries (DOGAMI) in Bulletin 99, Geology and Geological Hazards of North Clackamas County, Oregon (1979), or in any subsequent DOGAMI mapping for the Oregon City area;
- Portland State University study entitled “Environmental Assessment of Newell Creek Canyon, Oregon City, Oregon (1992);
- Portland State University study, "Landslides in the Portland, Oregon, Metropolitan Area Resulting from the Storm of February 1996: Inventory Map, Database and Evaluation" (Burns and others, 1998);
- DOGAMI Open File Report O-06-27, "Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from LIDAR Imagery and Aerial Photographs" (Madin and Burns, 2006);
- "Preliminary Geologic Map of the Oregon City Quadrangle, Clackamas County, Oregon" (Madin, in press).

We also reviewed the following, more recently published documents:

- Map showing faults, bedrock geology, and sediment thickness of west half of Oregon City 1:100,000 quad, Washington, Multnomah, Clackamas and Marion Counties, Oregon, 1998, IMS-4, Burns et al., (DOGAMI)
- *Oregon Geologic Data Standard v. 2.1,* 2009 (DOGAMI)
- *Geologic Map of the Oregon City 7.5’ Quadrangle, Clackamas County, Oregon*, 2009, GMS-119 (DOGAMI)
- *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs*, O-06-27, 2006 (DOGAMI)
- *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon*, IMS-26, 2009 (DOGAMI)

5.0 PRELIMINARY ENGINEERING GEOLOGY

According to Oregon City’s Geologic Hazards Checklist, a preliminary engineering geology report must be prepared that relates the following items to the actual development proposal:

- (5.1) A description of geologic formations, bedrock and surficial materials including artificial fill; location of any faults, folds, etc.
- (5.2) Structural data including bedding, jointing, and shear zones

- (5.3) Off-site geologic conditions that may pose a hazard to the site or that may be affected by on-site development
- (5.4) Cross sections showing subsurface structure, logs of subsurface explorations and analysis if necessary to evaluate the site
- (5.5) Signature and certification number of the engineering geologist
- (5.6) The report shall also contain a statement as to whether any hazard areas should not be disturbed because of the potential for damage to the site or neighboring properties
- (5.7) The report shall include specific comments resulting from their review of the civil plans for the project including recommendations on maximum cuts, structural fills, rockery walls, drainage behind any type of walls, maximum slopes above walls, removal of toe of slopes, the use of rock hammers and blasting, and so forth.

The above items are discussed individually in the following sections.

5.1 Geologic Description

Geologically, the site is located in the northern Willamette Valley, which consists of a structural trough between the Coastal Range and the Cascade Range. This basin is underlain by thick deposits of sand and gravel washed into it during the Pliocene epoch when the climate in the area was very dry. These granular deposits are locally covered by the Boring lavas (Qtb) in northwest Clackamas County.

Based on the *Oregon Geologic Data Standard v. 2.1* and Oregon Department of Geology and Mineral Industries *Geologic Map of the Oregon City 7.5' Quadrangle, Clackamas County, Oregon, 2009* this site is located within a geologic unit mapped as Tbc-Basalt of Canemah defined as flow or flows of grey medium-grained, olivine basalt. The Oregon Department of Geology and Mineral Industries (DOGAMI), Bulletin 99, *Geologic Map of the Canby and Oregon City Quadrangles, Oregon 1979*, maps the site as consisting of Boring lavas (Qtb), which it describes as Pliocene-Pleistocene lavas, light-gray, open-textured olivine basalt; flow structures common; includes some pyroclastic material of local extent; widely spaced joint pattern. Lavas and breccias have weathered to a residual red clay surface soil. Vertical exposures are susceptible to mass movement and deep bedrock sliding because of failure of underlying material (see the description below with clay materials within the Troutdale unit).

The Boring Lava deposits overly the Troutdale (Tpt), which are described as Pliocene sandstone and conglomerate; indurated beds and lenses of well-sorted sand and cobbly gravel with up to 30 percent quartzite clasts. Some sand originally composed of volcanic glass have altered to an impermeable high shrink-swell clay. The clay can be unstable and cause overlying competent units to fail by landslide. The publications indicate that on slopes where this clay layer daylights, one generally encounters a spring. Also, if layers dip out of the slope, it can become a failure

plane for a slump or slump-earthflow when the pore water pressure has built up to a critical value on top of the clay layer.

Based on the *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs, O-06-27, 2006* and the *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon, IMS-26, 2009,* a mapped landslide was identified adjacent to the site to the east. The landslide is identified as a prehistoric or ancient landslide (movement greater than 150 years ago). This is defined by landslide features that are slightly eroded and there is no evidence of historic (recent in last 150 years) movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

The borings completed for the previously referenced 2004 ZZA report are generally consistent with the above geologic mapping for the Boring Lavas/Basalt of Canemah, although the basalt has become deeply weathered in certain areas. The Troutdale unit was not encountered to the maximum depth of the borings at approximately 50½ feet below the ground surface. Although direct evidence of landslide features were not readily observed during our exploration programs for the 2004 report, we did observe the general headscarp area of the ancient landslide area during our 2012 slope reconnaissance with the aid of the recent Lidar-based landslide maps. An excerpt of the landslide map is appended as Exhibit A-2.

5.2 Structural Data

Bedrock outcrops or exposures were not observed during our site visits on the subject property or immediately downslope of the subject property. As discussed above, the bedrock in the site vicinity is mapped as Tbc-Basalt of Canemah defined as flow or flows of grey medium-grained, open-textured, olivine basalt. Flow structures are common, includes some pyroclastic material of local extent, and widely spaced joint pattern. Lavas and breccias have weathered to residual red clay surface soil. Vertical exposures are susceptible to mass movement and deep bedrock sliding because of failure of underlying material. The rock cores completed for the previously referenced 2004 ZZA report indicate close fracture spacing in the upper, weathered zones of the bedrock grading to wide fracture spacing in the fresh, competent bedrock at depth.

5.3 Off-Site Geologic Conditions

The *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs, O-06-27, 2006* and the *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon, IMS-26, 2009,* indicate a mapped landslide area adjacent to the east side of the site. The landslide is identified as a prehistoric or ancient landslide (movement greater than 150 years ago). This is defined by landslide features that are slightly eroded and there is no evidence of historic (recent in last 150

years) movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

During our initial exploration period during 2001-2002, we performed a surface reconnaissance of the steep slope area on the eastern edge of the site and immediately downslope of the site to the east. We also re-visited these areas on July 31, 2012 to determine the current conditions. During our slope reconnaissance visits, we walked and mapped the landslide area. We identified a main head scarp along the eastern site boundary, followed by numerous (3 to 5) internal scarps further east of the site within the ancient mapped landslide itself. A spring was observed at the base of the head scarp approximately 100 feet east of the northeast corner of the site at approximately 350 feet in elevation. A second spring was observed approximately 150 feet east of the southeast corner of the site at approximately 290 feet in elevation. Four nick points (i.e., drops in the streambed from erosion) were observed in the stream bed at the base of the ancient landslide ranging in height from 1½ feet to 6 feet. Gray, stiff to medium stiff, wet, lean clay with cemented clasts of gray clay was observed at various points along the stream bed. These deposits can be correlated to the fine grained portion of the Troutdale formation described above. At the time of our site reconnaissance Terracon did not identify new slide areas immediately downslope of the proposed development.

Our field observations agree with the above-referenced published landslide mapping. We did not observe indications of recent movement during our slope reconnaissance during the 2001-2002 ZZA exploration programs and our recent site visit in July 2012.

5.4 Geologic Cross-Sections

Our interpretation of the site's geologic cross-section is shown in Exhibit A-3 of this report.

5.5 Signature and Certification Number of Engineering Geologist

The signature and certification number of the engineering geologist is provided on the report signature page after the front cover.

5.6 Disturbance of Hazards Statement

The geologic hazards of concern for the site development are the steep slope area and ancient landslide to the east of the site. This geologic hazard area should not be disturbed due to the potential for damage to the site and/or neighboring properties. An exception for disturbance would be the removal of invasive vegetation, such as blackberry bushes, and replanting with species suitable for erosion control purposes. After removal of the invasive vegetation, minor grading may necessary, such as bucket smoothing and track walking the slope with a tracked

excavator, to reduce erosion and help temporary and permanent ground cover (e.g., hydroseed, mulch, bark, plantings, etc.) become established on the slope.

5.7 Civil Plans Review Comments

We have reviewed the current civil grading plans. The current site development plans are described in the Section 3 of this report and do not propose to disturb the geologic hazard area. These plans were developed using the 2004 ZZA report recommendations as a guideline. According to these plans, the maximum permanent cuts are relatively low, on the order of 2 to 3 feet for the retaining walls along the north property line. Fills will be up to approximately 12 feet along the east retaining wall area for the proposed truck route, but this wall will be located outside of a top of slope setback of 35 feet. The retaining walls, drainage behind the walls, and maximum slopes above and below the walls will be engineered as part of future design work for the site, and will consider the weight of the fill and loads on the retaining structure on the stability of the slope area. Consideration of the wall type, bedrock conditions, and associated installation procedures will also be included in the retaining wall design. In our opinion, the proposed site development is feasible from a geotechnical perspective without adverse impacts on the stability to the adjacent slope.

6.0 PRELIMINARY SOIL ENGINEERING REPORT

According to Oregon City's Geologic Hazards Checklist, a preliminary soil engineering report must be prepared that relates the following items to the actual development proposal:

- (6.1) The engineering feasibility of the proposed development and addressing strength properties of surface and subsurface soils with regard to stability of slopes
- (6.2) Appropriate types of foundations together with bearing values and settlement criteria for foundation design, soil erosion potential, permeability and infiltration rates
- (6.3) Excavation, filling and grading criteria including recommended final slopes
- (6.4) Surface and subsurface drainage; planting and maintenance of slopes
- (6.5) Other identified soil or subsurface constraints together with geotechnical remediation and other recommendations to alleviate or minimize their effects; and signature and seal of the geotechnical engineer
- (6.6) The report shall also contain a statement as to whether the proposed development, constructed in accordance with the recommended methods, is reasonably likely to be safe and prevent landslide or other damage to other properties over the long term, and whether any specific areas should not be disturbed by construction.

- (6.7) The report shall include specific comments resulting from their review of the civil plans for the project including recommendations on maximum cuts, structural fills, rockery walls, drainage behind any type of walls, maximum slopes above walls, removal of toe of slopes, the use of rock hammers and blasting, and so forth.

The above items are discussed individually in the following sections.

6.1 Engineering Feasibility

In our opinion, the proposed site development is feasible from a geotechnical perspective. Exhibits A-4 and A-5 show our preliminary slope stability models for static and seismic conditions, respectively. The following soil parameters were used in our analysis.

STRATA	FRICTION ANGLE (DEGREES)	COHESION (PSF)	UNIT WEIGHT (PCF)
Proposed Structural Fill	32	0	125
Existing Fill: Silt w/Debris	27	0	120
Highly – Moderately Weathered Basalt	30	250	125
Slightly Weathered to Fresh Basalt	45	250	150
Possible Slide Material	5	100	120

These parameters were partly based on the direct shear test results reported in the 2004 ZZA report and partly based on our engineering judgment. A horizontal seismic coefficient of 0.13g was used in our analysis, which is approximately one-half of the design earthquake peak ground acceleration determined per 2009 IBC methods. The models indicate factors of safety greater than 1.5 and 1.1 for static and seismic conditions, respectively. Based on the slope stability model, the proposed retaining wall and fill are far enough away from the slope and have low effect on the slope stability at the site from a preliminary standpoint.

6.2 Foundation Types, Soil Erosion Potential, Permeability/Infiltration

The appropriate type of foundation for the proposed buildings are conventional shallow spread footings. Allowable bearing values of 2,000 psf for up to 1 inch of settlement may be used for planning purposes.

According to the USDA Soil Conservation Service, the erosion potential of the site soils are "slight" on the relatively flat areas of the site and "severe" on the steep slope areas east of the site. Permeability ranges from 0.6 to 2.0 in the sites soils, however, infiltration systems are not recommended due to the location of the site adjacent the steep slope area.

6.3 Excavation, Filling, and Grading Criteria

Recommendations for excavation, filling and grading are included in the 2004 ZZA report and may be used for preliminary purposes. This information will be updated in the final geotechnical report.

6.4 Other Soil or Subsurface Constraints

Due to the previous development at the site, including existing foundations and floor slabs, existing fill will likely be encountered during subgrade preparation for fills and foundations. Within the proposed building pad, we recommend that all existing fill be removed down to suitable native soils, and the backfilled with compacted structural fill as recommended in the previous section and the 2004 report. Overexcavation of the existing fill soils will also likely be necessary in the retaining wall area along the east retaining wall (truck route). Alternatives, such as partial overexcavation and replacement or the use of aggregate pier ground improvement, should be considered during the final geotechnical report phase.

6.5 Proposed Development Stability Statement

In our opinion, the proposed development should not adversely affect the stability of the slope nor increase landslide risk to other properties with the incorporation of the 35-foot development setback. Additional fill or loads should not be placed over the unstable steep slope areas. The preliminary setback from the top of slope is currently 35 feet, but this may change on examination of new data and analysis from upcoming exploration and testing. It should be noted that there are documented, existing, ancient and recent landslides further downslope of the property that may continue to move but will not be adversely impacted by the subject site development. One benefit to the site development will actually be control of surface water, which currently is not being controlled above the steep slope area.

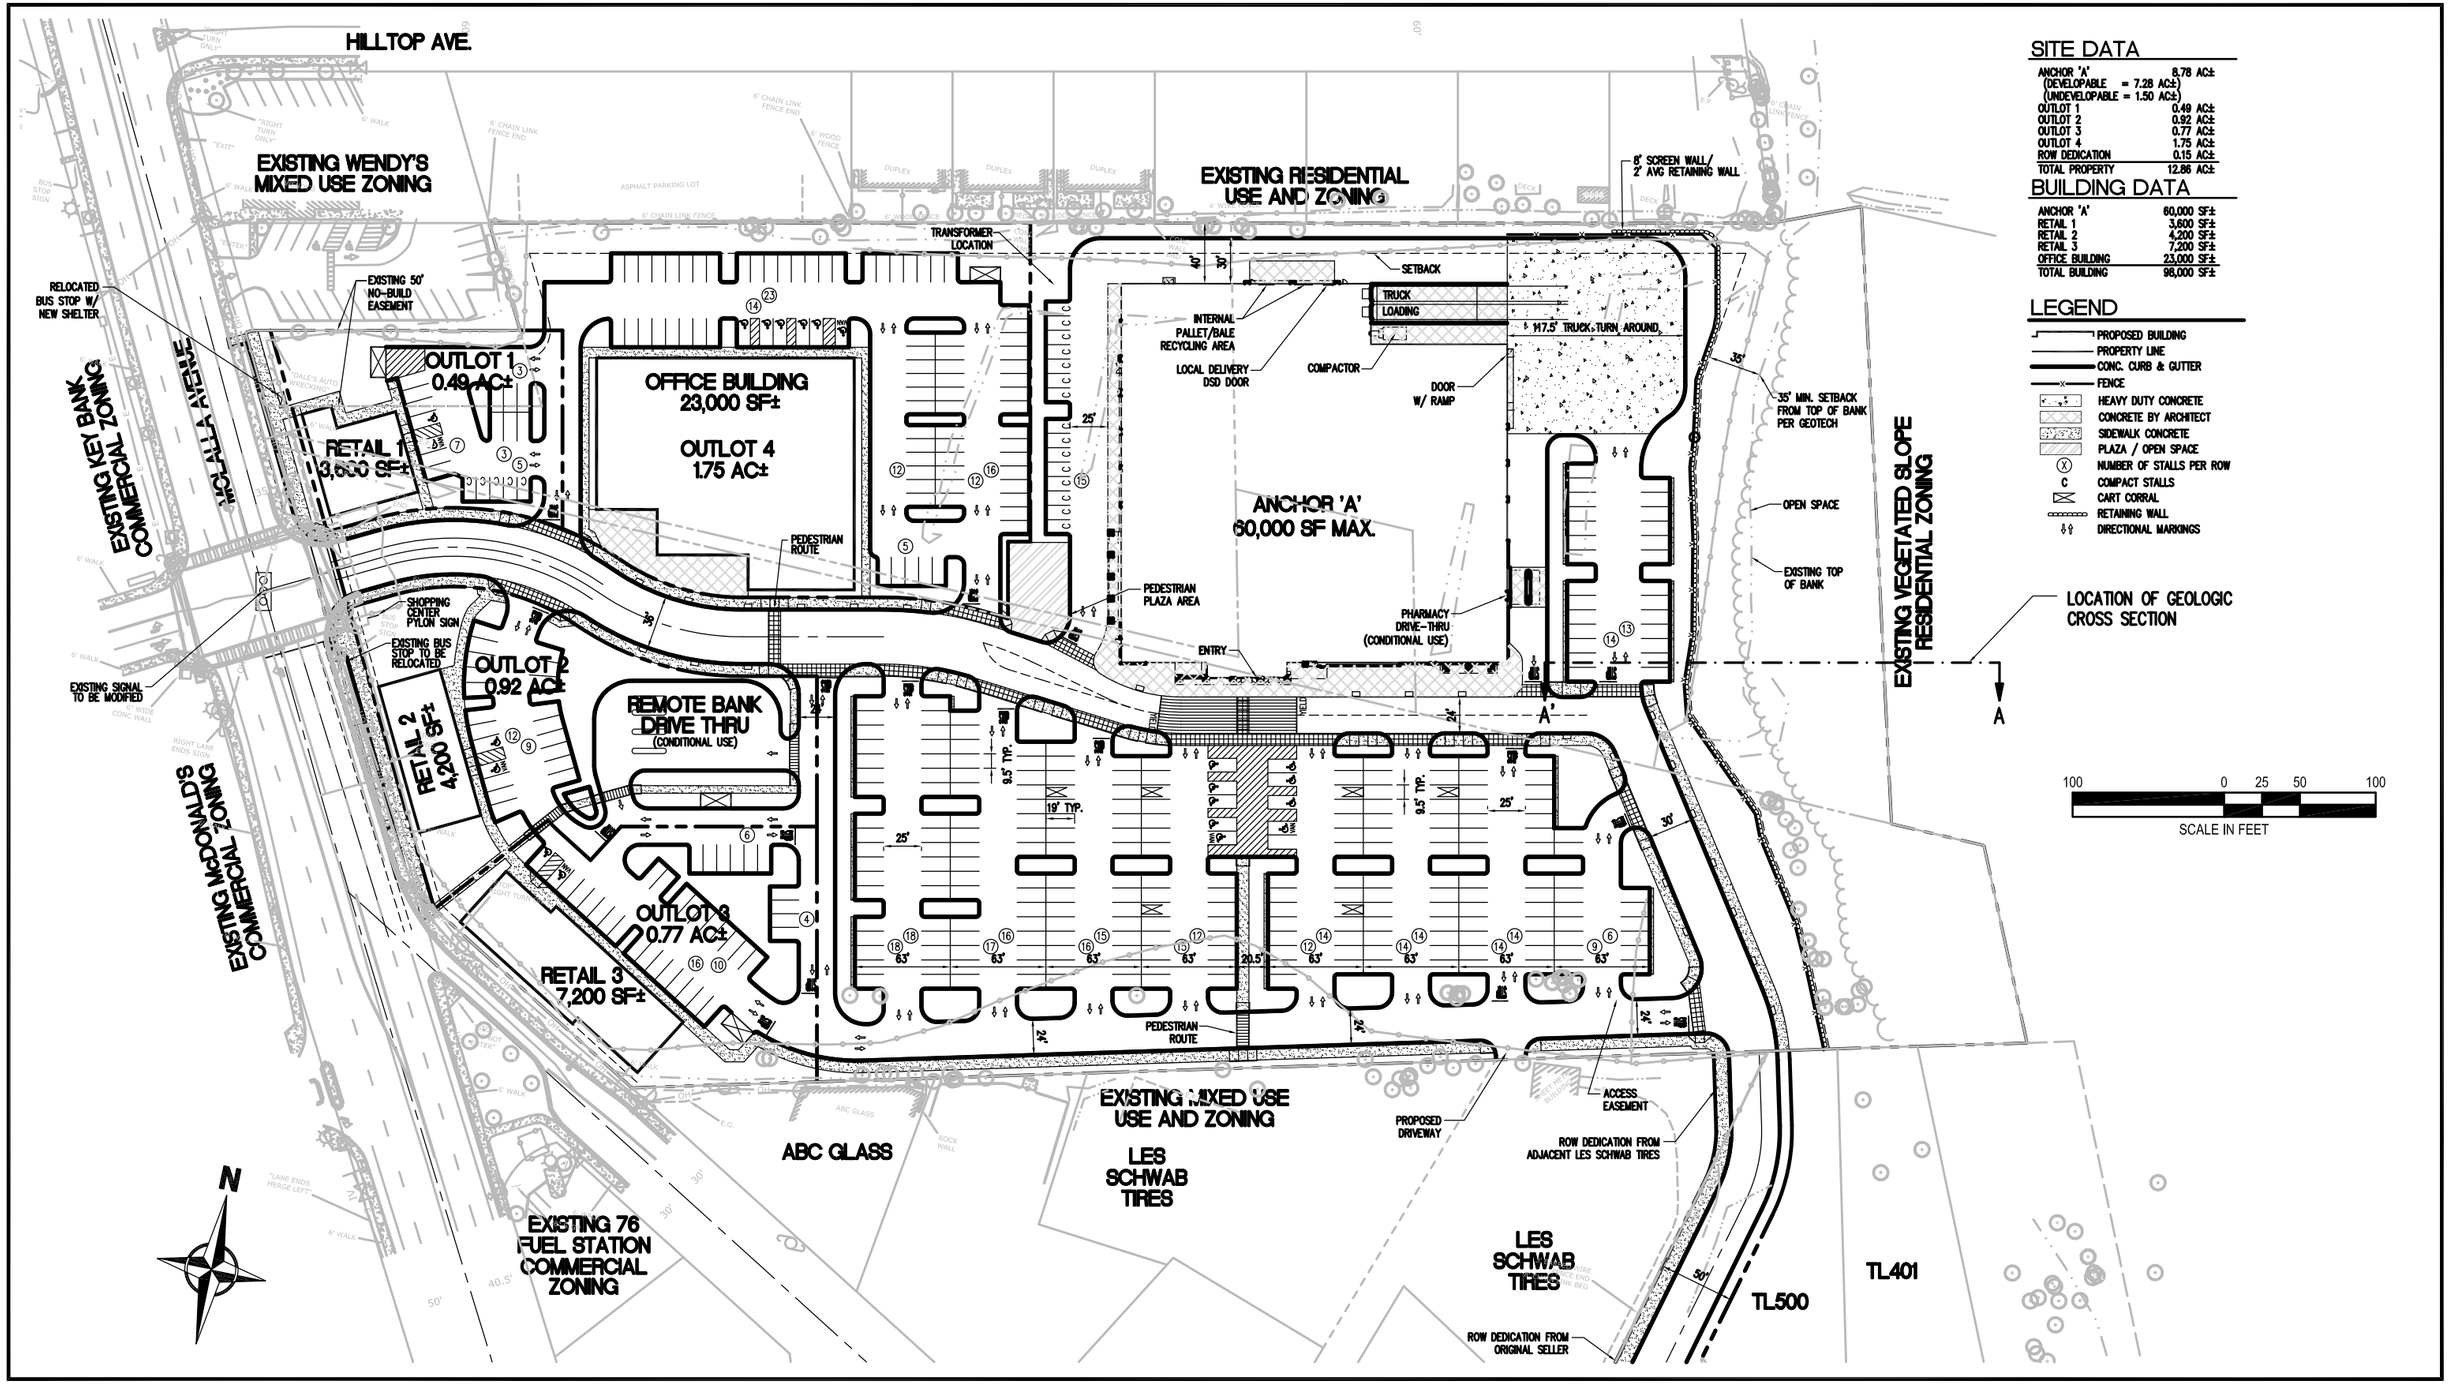
6.6 Civil Plans Review Comments

We have reviewed the current civil grading plans. The current site development plans are described in the Section 3 of this report and do not propose to disturb the geologic hazard area. These plans were developed using the 2004 ZZA report recommendations as a guideline. The maximum permanent cuts are relatively low, on the order of 2 to 3 feet for the retaining walls along the north property line. Fills will be up to approximately 12 feet along the east retaining

wall area for the proposed truck route, but this wall will be located outside of a top of slope setback of 35 feet. The retaining walls, drainage behind the walls, and maximum slopes above and below the walls will be engineered as part of future design work for the site, and will consider the weight of the fill and loads on the retaining structure on the stability of the slope area. Consideration of the wall type, bedrock conditions, and associated installation procedures will also be included in the retaining wall design. In our opinion, the proposed site development is feasible from a geotechnical perspective without adversely impacted the stability of the slope to the east.

7.0 GENERAL COMMENTS

Terracon should be retained to review the final design plans and specifications so comments can be made regarding interpretation and implementation of our geotechnical recommendations in the design and specifications. Terracon also should be retained to provide observation and testing services during grading, excavation, foundation construction and other earth-related construction phases of the project.



The analysis and recommendations presented in this report are based upon the data obtained from the borings performed at the indicated locations and from other information discussed in this report. This report does not reflect variations that may occur between borings, across the site, or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. If variations appear, we should be immediately notified so that further evaluation and supplemental recommendations can be provided.

The scope of services for this project does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

This report has been prepared in accordance with generally accepted geotechnical engineering practices for the exclusive use of PACLAND, and their respective successors and assigns, for specific application to the project location and stated purpose. No warranties, either express or implied, are intended or made. Site safety, excavation support, and dewatering requirements are the responsibility of others. In the event that changes in the nature, design, or location of the project as outlined in this report are planned, the conclusions and recommendations contained in this report shall not be considered valid unless Terracon reviews the changes and either verifies or modifies the conclusions of this report in writing.

LANDSLIDE ACTIVITY: Each landslide has been classified according to the relative age of last movement. This map display uses color to show the activity.

HISTORIC and/or ACTIVE (movement less than 150 years ago): The landslide appears to have moved within historic time or is currently moving (active).

PREHISTORIC or ANCIENT (movement greater than 150 years ago): Landslide features are slightly eroded and there is no evidence of historic movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

REF: Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon (DOGAMI, IMS 26).

2021 Exploration

Exploration Number	Exploration Type	Exploration Depth (feet)	Location	
			Latitude	Longitude
21-B-1	Drilled Boring	90½	45.3363°N	122.5863°W

Exploration Layout and Elevations: Terracon personnel provided the exploration layout. Coordinates were obtained with a handheld GPS unit (estimated horizontal accuracy of about ±10 feet) and approximate elevations were obtained from Google Earth Pro data. If elevations and a more precise exploration layout are desired, we recommend explorations be surveyed following completion of fieldwork.

Subsurface Exploration Procedures: We advance soil borings with a truck-mounted drill rig using continuous flight augers (hollow stem or solid stem). Four samples were typically obtained in the upper 10 feet of each boring and at intervals of 5 feet thereafter. Soil sampling was performed using thin-wall tube and/or split-barrel sampling procedures. In the thin-walled tube sampling procedure, a thin-walled, seamless steel tube with a sharp cutting edge is pushed hydraulically into the soil to obtain a relatively undisturbed sample. In the split barrel sampling procedure, a standard 2-inch outer diameter split barrel sampling spoon is driven into the ground by a 140-pound automatic hammer falling a distance of 30 inches. The number of blows required to advance the sampling spoon the last 12 inches of a normal 18-inch penetration is recorded as the Standard Penetration Test (SPT) resistance value. The SPT resistance values, also referred to as N-values, are indicated on the boring logs at the test depths. The samples were placed in appropriate containers, taken to our soil laboratory for testing, and classified by a geotechnical engineer. In addition, we observed and recorded groundwater levels during drilling and sampling.

All explorations were supervised and logged by a field geologist who recorded field test data, classified soils, and collected the samples from the explorations. Our exploration team prepared field boring logs as part of standard drilling operations including sampling depths, penetration distances, and other relevant sampling information. Field logs include visual classifications of materials encountered during drilling, and our interpretation of subsurface conditions between samples. Final boring logs, prepared from field logs, represent the geotechnical engineer's interpretation, and include modifications based on observations and laboratory tests.

Upon encountering bedrock or refusal-to-drilling conditions, rock coring (using NQ/NX rock core barrel) was performed within select borings.

All explorations were supervised and logged by a field engineer or field geologist who recorded field test data, classified soils, and collected the samples from the explorations. Our exploration team prepared field boring logs as part of standard drilling operations including sampling depths, penetration distances, and other relevant sampling information. Field logs include visual classifications of materials encountered during drilling, and our interpretation of subsurface conditions between samples. Final boring logs, prepared from field logs, represent the geotechnical engineer's interpretation, and include modifications based on observations and laboratory tests.

Vibrating Wire Piezometer: We installed one vibrating wire piezometer (VWP) in boring 21-B-1 on December 17, 2021. The VWP was installed at a depth of approximately 30¾ feet below the ground surface (bgs), at the top of the intact, very low permeability, Boring lava (basaltic bedrock). This depth was determined by the project geotechnical engineer following completion of drilling. Prior to installation, the lower portion of the boring was filled with a bentonite chip-grout mixture and low-permeability grout was extended from approximately 35 feet bgs to about 1-foot bgs.

During installation, the VWP was taped to a one-inch diameter PVC pipe with the pressure sensor facing upwards. The VWP cable was taped to the PVC pipe on approximate 3-foot intervals as it was lowered into the boring. Once the VWP was at the target depth, a bentonite chip-grout mixture was placed from the bottom of the exploration to a depth of approximately 35 feet bgs. Then a low permeability grout was introduced to seal the upper portion of the exploration and allow the mini data logger to record changes in the vibrating wire frequency, and thus changes in pressure. The VWP wire was connected to a mini data logger housed within a steel, flush-mount wellhead. The mini data logger was set to record vibrating wire readings every 4 hours, starting December 20, 2021 at 5:00PM. Completion of the VWP is summarized in the following table:

Depth (feet bgs)	Description	Detail
0	Steel, flush-mount wellhead	Approximate 8-inch diameter and 18-inches tall
0 to 1	Void (open space)	---
1 to 35	Low permeability grout	50 PSI Grout for Medium to Hard Soils 30 gallon Water / 94 lb. Portland Cement
30¾	VWP piezometer installation	Geokon 4500S-350KPA (51psi)
35 to 90½	Bentonite chip-low permeability grout mixture	50 PSI Grout for Medium to Hard Soils 30 gallon Water / 94 lb. Portland Cement / 25 lb. Bentonite

Property Disturbance: We backfilled borings according to local jurisdiction requirements after completion of each exploration. Our services do not include repair of the site beyond backfilling our boreholes. Excess auger cuttings were dispersed in the general vicinity of each borehole. Since backfill material often settles below the surface after a period, we recommend boreholes be checked periodically and additional backfill added, if necessary.

Laboratory Testing

The project engineer reviewed the field data and assigned laboratory tests to understand the engineering properties of the various soil strata, as necessary, for this project. The following tests were performed for this project.

- ASTM D2216 Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
- ASTM D6913 Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis
- AASHTO T-267 Standard Method of Test for Determination of Organic Content in Soils by Loss on Ignition
- ASTM D1883 Standard Test Method for California Bearing Ratio (CBR) of Laboratory-Compacted Soils
- ASTM D6913 Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis
- ASTM D1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort
- ASTM G51 Standard Test Method for Measuring pH of Soil for Use in Corrosion Testing
- ASTM C 1580 Standard Test Method for Water-Soluble Sulfate in Soil
- ASTM G187 Standard Test Method for Measurement of Soil Resistivity Using the Two-Electrode Soil Box Method
- ASTM D2938 Standard Test Method for Unconfined Compressive Strength of Intact Rock Core Specimens
- ASTM D3080 Standard Test Method for Direct Shear Test Of Soils Under Consolidated Drained Conditions

The laboratory testing program included examination of soil samples by an engineer. Based on the material's texture and plasticity, we described and classified the soil samples in accordance with the Unified Soil Classification System.

Rock classification was conducted using locally accepted practices for engineering purposes; petrographic analysis may reveal other rock types. Rock core samples typically provide an improved specimen for this classification. Boring log rock classification was determined using the Description of Rock Properties.

Boring Started: 12-16-2021 | Boring Completed: 12-17-2021

Drill Rig: Truck-mounted | Driller: Western States

Project No.: 82215043

THIS BORING LOG IS NOT VALID IF SEPARATED FROM ORIGINAL REPORT. GEO SMART LOG-NO WELL 82215043 OREGON CITY DEVEL.GPJ TERRACON_DATATEMPLATE.GDT 1/5/22

BORING LOG NO. 21-B-1

PROJECT: Oregon City Development

CLIENT: The Wolff Company LLC
Scottsdale, AZ

SITE: 1367 Molalla Avenue
Oregon City, OR

LOCATION See Exploration Plan

Latitude: 45.3363° Longitude: -122.5863°

Surface Elev.: 429 (Ft.)

DEPTH	ELEVATION (Ft.)	DEPTH (Ft.)	FIELD TEST RESULTS	STRENGTH TEST: TEST TYPE	STRENGTH TEST: COMPRESSIVE STRENGTH (tsf)	STRENGTH TEST: STRAIN (%)	WATER CONTENT (%)	DRY UNIT WEIGHT (pcf)	ATTERBERG LIMITS: LL-PL-PI
		55	RQD = 78%						
		60	RQD = 68%						
		65	RQD = 70%						
		70	RQD = 67%						
		75	RQD = 30%						
		80	RQD = 0%						
		85	RQD = 0%						
		90	RQD = 91%						

BASALT, gray, moist, sound, moderate spacing, unweathered, very strong *(continued)*

moderately fractured, very close fracture spacing, slightly weathered, fractured zone 70 to 80 feet bgs

sound, moderate spacing, unweathered, strong rock

90.5 338.5

Boring Terminated at 90.5 Feet

Stratification lines are approximate. In-situ, the transition may be gradual.
Vibrating wire piezometer installed at 30' bgs

Hammer Type: Automatic

Advancement Method:
Mud Rotary/Coring

Abandonment Method:
Boring Grouted with vibrating wire piezometer

See Exploration and Testing Procedures for a description of field and laboratory procedures used and additional data (If any).

See Supporting Information for explanation of symbols and abbreviations.

Elevation estimated from site topographic map

Notes:

WATER LEVEL OBSERVATIONS

Groundwater not encountered

BORING LOG	Figure A-5
Date Drilled: 10/31/01	Logged By: MJB

Test Pit TP-1
Approximate ground surface elevation: 425 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Duff over soft, damp, brown, SILT with trace fine sand. (Topsoil) Sparse fine roots to 1.2 feet and sparse medium roots to 2 feet.	S-1@0.5' MC=24%
1.0-3.0	Soft grading to stiff, damp, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles.	S-2@2' MC=16%
3.0-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown sandy silt with trace clay.	
	Test pit completed at 10.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-2
Approximate ground surface elevation: 435 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Duff over soft, damp to moist, dark brown, SILT with trace fine sand and occasional fine gravel. (Topsoil) Sparse fine roots to one foot and sparse medium to large roots to 2 ½ feet. Pocket penetrometer at 0.5 feet = 1.75 tons per square foot (tsf.)	
0.8-3.0	Soft grading to stiff, damp, orange-brown, SILT with trace clay, fine sand, and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders. Pocket penetrometer at 1.5 feet > 4.5 tsf.	S-1@1.5'
3.0-7.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown silt with trace clay to silty SAND. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2@3.5' MC=31%
	Digging refusal at 7.0 feet on a boulder on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-3
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Duff over soft, moist to wet, dark brown, SILT with trace fine sand and occasional gray, moderately weathered, round, basaltic andesite boulders. (Topsoil) Sparse fine to medium roots to 1.2 feet.	S-1@0.5' S-2@1.0' MC=41%
1.0-2.5	Soft grading to stiff, damp to moist, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 2.75 tsf.	S-3@2.0' MC=25%
2.5-11.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown sandy silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-4@10.5' MC=44%
	Test pit terminated at 11.5 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-4
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.3	Duff over soft, damp to moist, dark brown, SILT with trace fine sand (Topsoil.) Moderate to dense fine roots to 1.2 feet and sparse medium roots to 1.2 feet.	S-1@1.0' MC=36%
1.3-3.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.5 feet = 1.5 tsf.	S-2@2.5' MC=24%
3.0-11.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay.	S-3@6.0' MC=53%
	Test pit terminated at 11.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-5
Approximate ground surface elevation: 441 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Duff over soft, moist to wet, dark brown, SILT with trace fine sand (Topsoil) Moderate to dense fine roots to 1.0 feet and sparse medium roots to 1.2 feet.	S-1@0.5’
0.7-3.5	Medium stiff, damp to moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 3 feet > 4.5 tsf.	
3.5-7.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown sandy silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite boulders.	S-2@7.0’
	Test pit terminated at 7.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-6
Approximate ground surface elevation: 442 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Duff over soft, moist, dark brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine roots to 0.8 feet and sparse medium roots to 1.2 feet.	
0.7-3.5	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 3 feet = 2.0 to 2.5 tsf.	S-1@1.0’ S-2 @3.0’
3.5-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-3@5.5’
	Test pit terminated at 10.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-7
Approximate ground surface elevation: 443 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Short to medium length grass and blackberry vines over soft, moist to wet, dark brown, SILT with trace fine sand and occasional pockets of 3/8" minus crushed rock (Topsoil/FILL) Moderate to dense fine roots to medium roots to 1.2 feet.	S-1@0.5' MC=30%
1.0-3.5	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 3.75 tsf.	S-2@2.0' MC=21%
3.5-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional dark gray, subangular, slightly weathered, basalt with visible vesicles.	S-3@10.0' MC=56%
	Test pit terminated at 10.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-8
Approximate ground surface elevation: 443 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.2	Grass over soft, moist to wet, dark brown, sandy, gravelly SILT (Topsoil/FILL) Dense fine roots to 1.0 feet.	S-1@1.0'
1.2-4.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite boulders. Pocket penetrometer at 3.0 feet > 4.5 tsf.	
4.0-11.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2@10.5'
	Test pit terminated at 11.0 feet on 11/1/01. Slight groundwater seepage observed at 11.0 feet. No caving observed.	

Test Pit TP-9
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Short grass and blackberry vines over soft, moist to wet, brown, gravelly SILT with trace fine sand. (Topsoil/FILL) Moderate to dense fine to medium roots to 1.0 feet.	S-1@0.5’
0.7-6.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
6.0-10.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	
	Test pit terminated at 10.5 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-10
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines over soft, moist to wet, brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine to medium roots to 1.2 feet.	S-1@1.0’ MC=28%
1.0-3.0	Soft grading to stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
3.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-2@5.0’ MC=20%
	Test pit terminated at 11.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-11
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines over soft, moist to wet, dark brown, SILT with occasional gravel. (Topsoil) Moderate to dense fine to medium roots to 1.8 feet.	S-1@0.5 MC=32%
1.0-3.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@2.0' MC=29% S-3@5.0' MC=44%
3.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders. Test pit terminated at 11.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	S-4@9.0' MC=59%

Test Pit TP-12
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Short grass and blackberry vines over soft, moist to wet, brown, gravelly SILT with trace fine sand. (Topsoil/FILL) Moderate fine to medium roots to 0.9 feet.	S-1@1.0'
1.5-3.5	Soft grading to stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 1.75 tsf. Pocket penetrometer at 3.0 feet > 4.5 tsf.	
3.5-9.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders. Test pit terminated at 9.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-13
Approximate ground surface elevation: 445 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.5	Short grass and blackberry vines over soft, wet, brown, SILT with trace to some sand. (Topsoil) Moderate fine to medium roots to 1.5 feet.	S-1@0.3' MC=24%
0.5-3.0	Medium stiff grading to stiff, moist to wet, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@2.0'
3.0-6.0	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	
	Test pit terminated at 6.0 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-14
Approximate ground surface elevation: 447 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.5	Short grass and blackberry vines over soft, wet, brown, SILT with trace to some sand. (Topsoil) Moderate fine roots to 1.0 feet.	S-1@0.3'
0.5-4.0	Medium stiff to stiff, moist to wet, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@3.0'
4.0-5.5	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 5.5 feet on 11/2/01 due to equipment failure. No groundwater seepage observed. No caving observed.	

Test Pit TP-15
Approximate ground surface elevation: 447 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Grass over soft, damp to moist, brown, SILT with SILT and occasional gravel. (Topsoil) Moderate fine roots to 2.0 feet.	S-1@1.0' MC=27%
1.5-7.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
7.0-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown sandy silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2@9.0' MC=59%
	Test pit terminated at 10.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-16
Approximate ground surface elevation: 446 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine roots to 1.0 feet.	S-1@0.5'
1.0-4.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
4.0-7.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown sandy silt with trace clay.	S-2@6.0'
7.0-10.0	Medium dense to very dense, dark gray, moderately weathered, subangular to rounded, poorly sorted, vesicular basalt clasts in a matrix of medium stiff to stiff, damp, red silt with trace clay.	
	Test pit terminated at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-17
Approximate ground surface elevation: 447 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.7	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine roots to 1.0 feet.	S-1@0.5' MC=26% S-2@1.0' MC=26%
1.7-3.0	Medium stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-3@2.5' MC=21%
3.0-7.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-4@5.5' MC=26%
7.0-10.5	Medium dense to very dense, dark gray, moderately weathered, subangular to rounded, poorly sorted, vesicular basalt clasts in a matrix of medium stiff to stiff, damp, red silt with trace clay.	S-5@9.5' MC=55%
	Test pit terminated at 10.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-18
Approximate ground surface elevation: 405 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Soft, wet, dark brown, SILT with some gravel, organic debris and roots. (Topsoil)	
1.0-7.0	Very dense, moderately weathered, sub-rounded basaltic andesite boulders in matrix of medium dense, moist, orange-gray, silty SAND to sandy SILT.	
	Test pit completed at 7.0 on feet on 11/2/01 with refusal on boulder. No groundwater seepage observed. No caving observed.	

Test Pit TP-19
Approximate ground surface elevation: 402 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Soft, wet, dark brown, SILT with some clay and sand, organic debris and roots. (Topsoil)	
0.8-2.5	Loose to medium dense, moist, orange-gray, silty SAND to sandy SILT with occasional cobbles and boulders of severely weathered basalt.	S-1@2’
2.5-7.5	Very dense basaltic andesite boulders from 2 to 8 feet in diameter in a medium stiff, sandy SILT matrix.	
	Test pit completed at 7.5 feet on 11/2/01 with refusal on boulder. No groundwater seepage observed. No caving observed.	

Test Pit TP-20
Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Grass over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine roots to 0.8 feet, sparse medium roots to 1.2 feet.	
0.8-2.5	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@1.5’ MC=28%
2.5-10.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional, gray, moderately weathered, round basaltic andesite cobbles and boulders.	S-2@4.0’ MC=56%
	Test pit terminated at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-21
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.3	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine to medium roots to 1.5 feet.	S-1@0.5’
1.3-9.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@2.0’
9.5-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-22
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine and medium roots to 1.0 feet.	
1.0-6.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	
6.5-10.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-23
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Wood debris and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine and medium roots to 1.0 feet.	S-1@0.5' MC=25%
0.7-6.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 1.75 tsf. Pocket penetrometer at 3.5 feet = 3.0 to >4.5 tsf.	S-2@1.5' MC=26%
6.5-7.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	
	Test pit terminated at 7.5 feet due to space constraints on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-24
Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Metal debris over soft, damp, brown, blocky, SILT with trace fine sand. (Fill) Trace fine roots to 0.7 feet.	S-1@0.5' S-2@1.0'
0.8-1.5	Soft to medium stiff, moist, brown, SILT with trace clay. (FILL)	
1.5-3.5	Soft to medium stiff to stiff, moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-3@2.5'
3.5-4.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	
	Test pit terminated at 4.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-25
Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.5	Wrecking yard debris over soft to medium stiff, damp, brown, SILT with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and wrecking yard debris. (Fill) Trace fine to medium roots to 1.0 feet.	S-1@0.5' S-2@2.0'
4.5-7.5	Medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
7.5-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3@10.5'
	Test pit terminated at 10.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-26
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.4	1-inch of asphalt over 3-inches of 5/8" minus crushed rock base.	S-1@0.5' MC=26%
0.4–1.1	Soft to medium stiff, damp to moist, brown, SILT with trace fine sand and occasional gravel (Topsoil prior to paving.) Trace fine to medium roots to 0.6 feet. Pocket penetrometer at 1.0 feet > 1.5 tsf.	S-2@1.0' MC=27%
1.1-4.5	Medium stiff to stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders. Pocket penetrometer at 2.5 feet = A.5 tsf.	S-3@2.5' MC=37%
4.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay to silty SAND.	S-4@10.5' MC=46%
	Test pit terminated at 11.0 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-27
Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.6	Grass over loose, damp to wet, brown silty GRAVEL and wrecking yard debris. (FILL). Trace fine to medium roots to 1.6 feet.	S-1@0.5’
0.6–1.3	Soft to medium stiff, damp, brown, SILT with trace fine sand and occasional gravel (Relic topsoil)	
1.3-3.0	Medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@1.5’
3.0-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-28
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Blackberry vines over loose, damp to wet, brown silty GRAVEL and wrecking yard debris. (FILL) Trace fine to medium roots to 1.5 feet.	S-1@0.5' MC=16%
0.8–1.5	Soft to medium stiff, damp to moist, dark brown, SILT with trace fine sand and occasional gravel. (Relic topsoil)	S-2@1.0' MC=32%
1.3-3.2	Medium stiff to stiff, moist, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-3@2.5' MC=31%
3.2-8.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite and boulders.	S-4@6.0' MC=57%
	Test pit terminated at 8.5 feet on a boulder on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-29
Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.0	Grass over soft to medium stiff, damp to moist, brown, SILT with gravel and occasional asphalt debris. (Fill) Dense fine roots to 0.5 feet.	S-1@1.5'
4.0-7.5	Medium stiff to stiff, moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@5.0'
7.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	
	Test pit terminated at 11.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-30
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.8	Grass and gravel over soft to medium stiff, damp to moist, brown, SILT with gravel and occasional asphalt debris. (FILL) Moderate fine roots to 0.3 feet. Occasional gray, moderately weathered, round, basaltic andesite boulders.	S-1@1.0’
1.8-6.0	Medium stiff to stiff, moist, orange-brown grading to red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
6.0-11.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 11.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-31
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-5.0	Grass and gravel over soft to medium stiff, damp to moist, brown, SILT with gravel and occasional asphalt debris. (FILL) Moderate fine roots to 1.1 feet.	
5.0-9.5	Medium stiff to stiff, moist, orange-brown grading to red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@6.0’ MC=25%
9.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2@11.0’ MC=53%
	Test pit terminated at 11.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-32
Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0–1.0	Blackberry vines over loose, damp to moist, dark brown, SILT with gravel and occasional metal debris. (Topsoil/FILL) Moderate fine to medium roots to 1.2'.	S-1@0.5' MC=11%
1.0-1.7	Soft to medium stiff, damp, light brown, SILT with trace sand and occasional gravel and metal debris. (FILL)	S-2@1.3' MC=25%
1.7-3.0	Medium stiff, damp, light brown, SILT with occasional asphalt and metal debris. (FILL)	S-3@2.5' MC=20%
3.0-4.7	Medium stiff, damp, reddish-brown, SILT with occasional fine to medium roots.	
4.7-9.0	Medium stiff to stiff, moist, orange-brown grading to reddish-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-4@7.5' MC=27%
9.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-5@9.5'

Test pit terminated at 11.0 feet on 11/2/01.
No groundwater seepage observed.
No caving observed.
Fill was from Molalla Avenue cut, approximately 50 years ago, according to Rocky Younger, property owner.

Test Pit TP-33
Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Short grass, blackberry vines, and metal debris over soft, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel. (Topsoil/FILL) Moderate fine to medium roots to 1.0 feet.	S-1@0.8’
1.0-5.5	Medium stiff, damp, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
5.5-11.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 11.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-34
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-2.0	Short grass and metal debris over medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@1.5’ MC=41%
2.0-12.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2@9.5’ MC=66% S-3@12.0’ MC=62%
	Test pit terminated at 12.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-35
Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Metal debris over loose, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel and wrecking yard debris. (Topsoil/FILL) Moderate fine and medium roots to 1.0 feet.	S-1@0.5’
1.0-3.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
3.5-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-36
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines and metal debris over soft to medium stiff, damp to moist, brown, SILT with trace fine sand and wrecking yard debris (Topsoil/FILL) Moderate fine and medium roots to 1.0 feet. Pocket penetrometer at 1.0 feet = 1.5 tsf.	S-1@1.0’ MC=29%
1.0-5.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 1.5 tsf. Pocket penetrometer at 2.5 feet = 2.5 tsf.	S-2@2.0’ MC=29%
5.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3@10.5’ MC=50%
	Test pit terminated at 11.0 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-37
Approximate ground surface elevation: 431 Feet

Depth (feet)	Material Description	Sample No.
0.0-5.0	Blackberry vines over soft to medium stiff, damp to moist, brown, SILT with significant large pieces of concrete and asphalt debris. (FILL) Moderate fine and medium roots to 1.4 feet.	S-1@1.0' MC=19%
5.0-8.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@7.0' MC=35%
8.0-12.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3@10.0' MC=50%
	Test pit terminated at 12.5 feet on a boulder on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-38
Approximate ground surface elevation: 431 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines and short grass over medium dense, moist to wet, brown, silty sandy GRAVEL with significant asphalt debris (FILL) Moderate fine and medium roots to 0.8 feet.	S-1@0.5'
1.0-5.5	Soft to medium stiff, damp, orange-brown SILT with significant large pieces of asphalt and concrete debris. (FILL)	S-2@2.0'
	Digging refusal at 5.5 feet due on concrete debris on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-39
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Duff and asphalt debris over soft to medium stiff, damp to moist, orange-brown, SILT with some sand and occasional asphalt debris and 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-1@1.0' MC=46%
3.5-7.5	Soft to medium stiff, moist, brown, SILT with organics, and occasional wood and metal debris. (FILL)	S-2@4.0' MC=26% S-3@7.0' MC=28%
7.5-10.5	Medium stiff to stiff, damp to moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
10.5-13.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders.	S-4@11.5' MC=42%
	Test pit terminated at 13.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-40
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.9	Duff over soft, damp, brown, SILT with trace fine sand. (Topsoil) Sparse fine roots to 1.0 feet and sparse medium roots to 1.9 feet.	S-1@1.0' MC=23%
1.9-3.0	Medium stiff, damp, orange-brown, sandy SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders. Pocket penetrometer at 2.0 feet >4.5 tsf.	S-2@2.5' MC=21%
3.0-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders.	S-3@5.5' MC=21%
	Test pit completed at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-41
Approximate ground surface elevation: 441 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Duff over soft, damp to moist, brown, SILT with trace fine sand and occasional gravel. (Topsoil) Moderate fine to medium roots to 1.2 feet and sparse large roots to 1.5 feet.	S-1@0.5-2.0' S-1A@0.5-2.5'
1.5-2.5	Soft grading to stiff, damp, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders.	S-2@2.5' MC=26%
2.5-6.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders.	S-3@5.5'
	Digging refusal at 10.0 feet on a boulder on 11/3/01. No groundwater seepage observed. No caving observed. Samples S-1 and S-1A were shelby tube samples.	

Test Pit TP-42
Approximate ground surface elevation: 432 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Soft to medium stiff, wet, brown grading to orange-brown, SILT with some sand, organic debris and roots to 3". (Topsoil)	
1.0-4.0	Soft grading to stiff, damp, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders.	
4.0-6.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders to 3 feet in diameter.	
	Test pit completed at 6.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-43
Approximate ground surface elevation: 426 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Medium stiff, moist to wet, orange-brown, sandy SILT with some gravel, clay, and debris consisting of concrete, asphalt, crushed rock, and wire. (Fill)	S-1@1'
3.5-7.8	Soft to medium stiff, wet, dark gray-brown, SILT with some clay, sand and gravel. Occasional clasts of concrete, asphalt, brick and trace organic material. (Fill)	S-2@5'
7.8-8.0	Pine needles and thin branches to 1-inch in diameter. (Fill)	
8.0-11.0	Large andesitic boulder encountered at east end of test pit. Boulder appeared to be in a matrix of stiff to medium stiff, gray-brown SILT. (Fill)	
	Test pit completed at 11.0 feet on 3/4/02. Very slight seepage observed at 9 feet at time of exploration. No caving observed.	

Test Pit TP-44
Approximate ground surface elevation: 421.5 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.3	Grass sod.	
0.3-6.0	Soft to medium stiff, wet, orange-brown, sandy SILT with some clay and gravels. Occasional clasts of asphalt and concrete to 2 feet in diameter. 2-½ foot diameter andestitic boulder encountered at 1.5 feet. (Fill)	S-1@2'
6.0-8.0	Soft grading to stiff, wet, orange-brown, SILT with some clay and trace to some gray, sub-rounded clasts of severely weathered basaltic ardisite.	
8.0-11.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular to sub-rounded, poorly sorted basaltic andesite clasts in a matrix of medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay.	
	Test pit completed at 11.0 feet on 3/4/02. No groundwater observed at time of exploration. No caving observed.	

Test Pit TP-45
Approximate ground surface elevation: 433.5 Feet

Depth (feet)	Material Description	Sample No.
0.0-2.5	Soft grading to stiff, moist, orange-brown, SILT with trace to some clay, sand, and 3 inch minus fragments of severely weathered basaltic andesite.	S-1@1'
2.5-6.0	Very dense, damp, gray, moderately weathered andesitic boulders to 3 feet in diameter in a matrix of medium stiff to stiff, moist to wet, orange-brown, SILT with trace clay to silty SAND with trace clay. Boulders sub-angular to rounded.	
	Test pit completed at 6.0 feet with refusal on 6-foot diameter andesitic boulder. No groundwater observed at time of exploration. No caving observed.	

Test Pit TP-46
Approximate ground surface elevation: 438 Feet

Depth (feet)	Material Description	Sample No.
0.0-6.0	Concrete and asphalt debris with matrix of sandy GRAVEL with some silt (dirty crushed rock). Approximately 40% asphalt and 20% concrete based on visual estimation. (Fill)	
6.0-7.0	Soft to medium stiff, moist, orange-brown, SILT with some sand and clay.	
	Test pit completed at 7 feet on 3/4/02. No groundwater seepage observed at time of exploration. No caving observed.	

Test Pit TP-47
Approximate ground surface elevation: 435 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.2	Grass sod.	
0.2-3.0	Asphalt debris in matrix of sandy gravel with some silt (crushed rock). Approximately 40-50% asphalt based on visual estimation. (Fill)	S-1@1'
3.0-6.0	Medium stiff, moist, orange-brown, sandy SILT with some gravel and trace clay. (Fill)	
6.0-8.5	Soft grading to stiff, moist, orange-brown, SILT with trace to some clay, sand, and 3 inch minus fragments of severely weathered basaltic andesite.	S-2@4'
8.5-11.0	Very dense, damp, gray, moderately weathered andesitic boulders to 3 feet in diameter in a matrix of medium stiff to stiff, moist to wet, orange-brown, SILT with trace clay to silty SAND with trace clay. Boulders sub-angular to rounded.	
	Test pit completed at 11.0 feet on 3/4/02. No groundwater seepage observed at time of exploration. No caving observed.	

Test Pit TP-48
Approximate ground surface elevation: 433 Feet

Depth (feet)	Material Description	Sample No.
0.0-5.5	Stiff to medium stiff, moist to wet, orange-brown, SILT with some sand and trace clay and occasional clasts of asphalt and concrete. (Fill)	
5.5-10.0	Randomly oriented rebar reinforced concrete debris from 6 to 8 inches thick and up to 4 feet across. Approximately 5% of debris consisted of rebar, asphalt, and wire. (Fill)	
	Test pit completed at 10.0 feet on 3/4/02 due to refusal on large concrete debris. No groundwater seepage observed at time of exploration. No caving observed.	

Test Pit TP-1A
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-6.0	Duff and asphalt debris over very soft to medium stiff, moist, reddish-brown, SILT with some sand and occasional asphalt debris and 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-1 @ 0.5' S-2 @ 2'
6.0-9.0	Soft to medium stiff, moist, gray SILT with organic and metal debris and occasional cobbles of of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-3 @ 8'
9.0-12.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-4 @ 9.5'
	Test pit terminated at 12.0 feet on 03/01/2002. Slight groundwater seepage observed at 9.0 feet, perched on native soils. No caving observed.	

Test Pit TP-2A
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Duff over 7-inches of asphalt over 3-inches of 3/8-inch minus crushed rock base.	S-1 @ 1'
0.8-8.0	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-2 @ 8'
8.0-9.0	Soft, damp to moist, light gray to dark gray, SILT with trace clay and wood, metal, glass, and rubber debris. (FILL)	
9.0-11.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
	Test pit terminated at 11.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-3A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.3	Metal debris over soft, damp to moist, gray SILT with trace clay and occasional fine rootlets. Slight to moderate odor of oil impact. (FILL)	
0.3-7.5	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-1 @ 0.5' S-2 @ 2'
7.5-8.0	Soft, damp to moist, orange-brown silt with trace clay and fine rootlets. (Relict topsoil horizon)	
8.0-12.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 12.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-4A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Metal debris over 5/8-inch minus crushed rock base. Very strong odor of oil impact. Visible free product (appears to be crankcase oil) in crushed rock. (FILL)	S-1 @ 1'
1.5-8.0	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-2 @ 3' S-3 @ 7'
8.0-10.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
	Test pit terminated at 12.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-5A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Metal debris and grass over very soft, damp, gray SILT with trace clay and gravel. (FILL)	S-1 @ 1'
1.0-8.5	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-2 @ 8'
8.5-9.0	Loose, damp, brown-gray SILT with trace clay, occasional gravel and fine rootlets. (Relict topsoil horizon.)	
9.0-11.0	Medium stiff, damp, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 11.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-6A

Approximate ground surface elevation: 431 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines and short grass over soft, damp, dark gray SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	
1.0-6.0	Soft to medium stiff, damp, red-brown SILT with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and large pieces of asphalt and concrete debris. (FILL)	S-1@2.0'
6.0-6.5	Medium dense, damp, gray sandy SILT with some gravel. (FILL)	
	Digging refusal at 6.5 feet due on concrete debris on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-7A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.4	8-inches of asphalt over 8-inches of 3/8-inch minus crushed rock base. Very strong odors of gasoline and weathered gasoline. Gasoline dissolving asphalt.	
1.4-2.5	Soft, moist, red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and gravel. (FILL)	S-1 @ 1.5'
2.5-5.0	Soft to medium stiff, moist, red-brown SILT with trace clay and occasional 3-inch minus, gray angular fragments of severely to highly weathered, highly fractured basaltic andesite.	S-2 @ 3.5'
5.0-9.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-3 @ 6' S-4 @ 6.5'
	Test pit terminated at 9.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-8A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Soft, damp to moist, dark brown SILT with trace clay and occasional gravel.	
1.0-3.5	Soft to medium stiff, damp, red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and gravel.	S-1 @ 3'
3.5-7.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay	S-2 @ 6.5'
	Test pit terminated at 7.5 feet on 03/01/2002. Moderate groundwater seepage observed at 6.5 feet. Slight caving observed below 6.5 feet.	

Test Pit TP-9A

Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Medium dense, damp, dark gray silty sandy GRAVEL with occasional cobbles. (FILL)	S-1 @ 1.5'
3.5-5.5	Soft to medium stiff, damp to moist, orange-red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 3.5'
5.5-9.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-3 @ 9.5'
	Test pit terminated at 9.5 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-10A

Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Loose to medium dense, damp, gray-brown SILT with trace clay and trace fine sand and occasional fine highly weathered, highly fractured basaltic andesite gravel.	S-1 @ 1'
1.5-4.5	Soft to medium stiff, damp, orange-red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 2'
4.5-6.5	Medium stiff to stiff, damp, red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
6.5-7.0	Medium dense to very dense, gray, highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-3 @ 7'
	Test pit terminated at 7.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-11A

Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Sparse grass and metal debris over 5/8-inch minus crushed rock base. (FILL)	
0.8-2.0	Soft to medium stiff, damp, gray, SILT with trace clay and occasional metal, rubber, and glass debris. Slight odor of weathered gasoline and slight staining observed. (FILL)	S-1 @ 1.5'
2.0-4.5	Soft to medium stiff, damp, red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2 @ 3'
4.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-3 @ 5.5' S-4 @ 11'

Test pit terminated at 11.0 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-12A

Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Grass and blackberry vines over soft, damp, dark brown, SILT with trace fine sand, trace clay and occasional gray, highly weathered, round, basaltic andesite gravel.	
1.0-4.0	Medium stiff to stiff, damp to moist, reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
4.0-10.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, wet grading to damp, yellow silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-1 @ 4'

Test pit terminated at 10.0 feet on 03/02/2002
Very slight groundwater seepage observed at 4 feet.
No caving observed.

Test Pit TP-13A

Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Metal debris over loose, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel and debris. (Topsoil/FILL)	
1.0-4.0	Medium stiff to stiff, damp to moist, reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@1'
4.0-9.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2 @ 4.5' S-3 @ 9'

Test pit terminated at 9.5 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-14A

Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-2.0	Loose, damp, gray, SILT with trace clay and occasional pockets of 5/8-inch minus gravel and debris. Slight odor of oil impact to upper foot of soils, slight staining in upper foot of soils. (FILL)	S-1@1'
2.0-4.5	Soft to medium stiff, damp to moist, reddish-orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 2.5'

Test pit terminated at 4.5 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-15A

Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.5	5/8-inch minus crushed rock base over soft to medium stiff, damp, gray brown, SILT with trace sand and occasional gravel and asphalt debris. (FILL)	S-1 @ 2'
4.5-7.5	Soft to medium stiff, damp, reddish-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 5'
7.5-9.5	Medium dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3 @ 8.5'
9.5-11.5	Dense to very dense, gray, highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-4 @ 11.5'
	Test pit terminated at 11.5 feet on 03/02/2002 No groundwater seepage observed. No caving observed. Cesspool cistern discovered at 1.5 to 5 feet. Test pit relocated to north of cistern, adjacent.	

Test Pit TP-16A

Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.5	Soft, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel. (Topsoil/FILL)	
0.5-2.5	Soft, damp, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1 @ 2'
2.5-9.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2 @ 5' S-3 @ 8.5'
	Test pit terminated at 9.5 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-17A
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.0	4-inches of asphalt over soft, damp, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1 @ 1' S-2 @ 3'
4.0-10.0	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay to silty SAND.	S-3 @5.5' S-4 @ 9'

Test pit terminated at 10.0 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

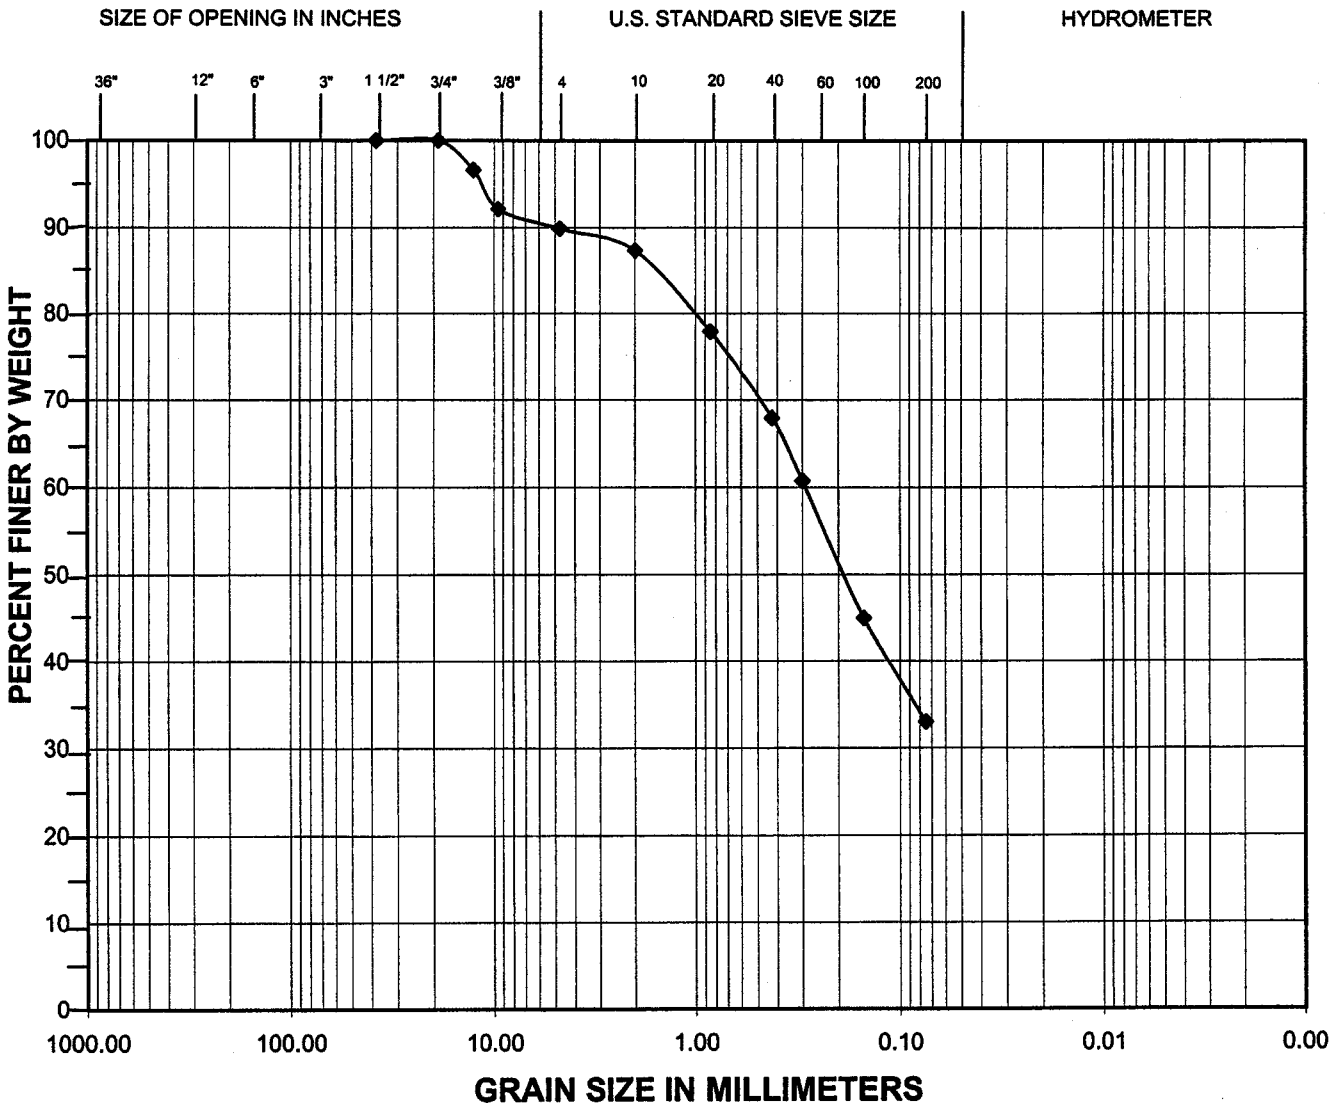
Test Pit TP-18A
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-6.0	Broken asphalt over soft grading to medium stiff, damp, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1 @ 3'
6.0-10.0	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay to silty SAND.	S-2 @ 6' S-3 @ 10'

Test pit terminated at 10.0 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-19A

Approximate ground surface elevation: 451 Feet



Depth (feet)	Material Description	Sample No.
0.0-1.5	2-inches of 5/8-inch minus crushed rock over soft, damp to moist, dark brown-gray, SILT with trace clay, occasional gravel and occasional metal debris. (FILL)	S-1 @ 1'
1.5-5.0	Medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 3'
5.0-8.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3 @ 7'
	Test pit terminated at 8.0 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-20A

Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Gravel over soft to medium stiff, damp, reddish-brown, SILT with gravel and trace clay and occasional asphalt debris. Occasional gray, moderately weathered, round, basaltic andesite boulders. (FILL).	S-1 @ 2'
3.5-4.0	Soft to medium stiff, damp, brown, SILT with trace clay and fine rootlets. (Relict topsoil horizon.)	
4.0-9.0	Medium stiff, damp, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 4' S-3 @ 7'
9.0-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to wet, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-4 @ 9.5'
	Test pit terminated at 10.0 feet on 03/02/2002. Moderate groundwater seepage observed at 9.5 feet. No caving observed.

Terracon GeoReport

SAMPLING	WATER LEVEL	FIELD TESTS
Rock Core Grab Sample Standard Penetration Test	**Water Initially Encountered** **Water Level After a Specified Period of Time** **Water Level After a Specified Period of Time** **Cave In Encountered** Water levels indicated on the soil boring logs are the levels measured in the borehole at the times indicated. Groundwater level variations will occur over time. In low permeability soils, accurate determination of groundwater levels is not possible with short term water level observations.	**N** Standard Penetration Test Resistance (Blows/Ft.) **(HP)** Hand Penetrometer **(T)** Torvane **(DCP)** Dynamic Cone Penetrometer **UC** Unconfined Compressive Strength **(PID)** Photo-Ionization Detector **(OVA)** Organic Vapor Analyzer

DESCRIPTIVE SOIL CLASSIFICATION

Soil classification as noted on the soil boring logs is based Unified Soil Classification System. Where sufficient laboratory data exist to classify the soils consistent with ASTM D2487 "Classification of Soils for Engineering Purposes" this procedure is used. ASTM D2488 "Description and Identification of Soils (Visual-Manual Procedure)" is also used to classify the soils, particularly where insufficient laboratory data exist to classify the soils in accordance with ASTM D2487. In addition to USCS classification, coarse grained soils are classified on the basis of their in-place relative density, and fine-grained soils are classified on the basis of their consistency. See "Strength Terms" table below for details. The ASTM standards noted above are for reference to methodology in general. In some cases, variations to methods are applied as a result of local practice or professional judgment.

LOCATION AND ELEVATION NOTES

Exploration point locations as shown on the Exploration Plan and as noted on the soil boring logs in the form of Latitude and Longitude are approximate. See Exploration and Testing Procedures in the report for the methods used to locate the exploration points for this project. Surface elevation data annotated with +/- indicates that no actual topographical survey was conducted to confirm the surface elevation. Instead, the surface elevation was approximately determined from topographic maps of the area.

STRENGTH TERMS

RELATIVE DENSITY OF COARSE-GRAINED SOILS (More than 50% retained on No. 200 sieve.) Density determined by Standard Penetration Resistance		CONSISTENCY OF FINE-GRAINED SOILS (50% or more passing the No. 200 sieve.) Consistency determined by laboratory shear strength testing, field visual-manual procedures or standard penetration resistance		
Descriptive Term (Density)	**Standard Penetration or N-Value Blows/Ft.**	**Descriptive Term (Consistency)**	**Unconfined Compressive Strength Qu, (tsf)**	**Standard Penetration or N-Value Blows/Ft.**
Very Loose	0 - 3	Very Soft	less than 0.25	0 - 1
Loose	4 - 9	Soft	0.25 to 0.50	2 - 4
Medium Dense	10 - 29	Medium Stiff	0.50 to 1.00	4 - 8
Dense	30 - 50	Stiff	1.00 to 2.00	8 - 15
Very Dense	> 50	Very Stiff	2.00 to 4.00	15 - 30
		Hard	> 4.00	> 30

RELEVANCE OF SOIL BORING LOG

The soil boring logs contained within this document are intended for application to the project as described in this document. Use of these soil boring logs for any other purpose may not be appropriate.

Criteria for Assigning Group Symbols and Group Names Using Laboratory Tests [A]					Soil Classification	
					Group Symbol	Group Name [B]
Coarse-Grained Soils: More than 50% retained on No. 200 sieve	**Gravels:** More than 50% of coarse fraction retained on No. 4 sieve	**Clean Gravels:** Less than 5% fines [C]	$Cu \geq 4$ and $1 \leq Cc \leq 3$ [E]		GW	Well-graded gravel [F]
			$Cu < 4$ and/or [Cc<1 or Cc>3.0] [E]		GP	Poorly graded gravel [F]
		Gravels with Fines: More than 12% fines [C]	Fines classify as ML or MH		GM	Silty gravel [F, G, H]
			Fines classify as CL or CH		GC	Clayey gravel [F, G, H]
	Sands: 50% or more of coarse fraction passes No. 4 sieve	**Clean Sands:** Less than 5% fines [D]	$Cu \geq 6$ and $1 \leq Cc \leq 3$ [E]		SW	Well-graded sand [I]
			$Cu < 6$ and/or [Cc<1 or Cc>3.0] [E]		SP	Poorly graded sand [I]
		Sands with Fines: More than 12% fines [D]	Fines classify as ML or MH		SM	Silty sand [G, H, I]
			Fines classify as CL or CH		SC	Clayey sand [G, H, I]
Fine-Grained Soils: 50% or more passes the No. 200 sieve	**Silts and Clays:** Liquid limit less than 50	**Inorganic:**	PI > 7 and plots on or above "A"		CL	Lean clay [K, L, M]
			PI < 4 or plots below "A" line [J]		ML	Silt [K, L, M]
		Organic:	Liquid limit - oven dried / Liquid limit - not dried	< 0.75	OL	Organic clay [K, L, M, N] / Organic silt [K, L, M, O]
	Silts and Clays: Liquid limit 50 or more	**Inorganic:**	PI plots on or above "A" line		CH	Fat clay [K, L, M]
			PI plots below "A" line		MH	Elastic Silt [K, L, M]
		Organic:	Liquid limit - oven dried / Liquid limit - not dried	< 0.75	OH	Organic clay [K, L, M, P] / Organic silt [K, L, M, Q]
Highly organic soils:	Primarily organic matter, dark in color, and organic odor				PT	Peat

[A] Based on the material passing the 3-inch (75-mm) sieve.

[B] If field sample contained cobbles or boulders, or both, add "with cobbles or boulders, or both" to group name.

[C] Gravels with 5 to 12% fines require dual symbols: GW-GM well-graded gravel with silt, GW-GC well-graded gravel with clay, GP-GM poorly graded gravel with silt, GP-GC poorly graded gravel with clay.

[D] Sands with 5 to 12% fines require dual symbols: SW-SM well-graded sand with silt, SW-SC well-graded sand with clay, SP-SM poorly graded sand with silt, SP-SC poorly graded sand with clay.

[E] $Cu = D_{60}/D_{10}$ $\quad Cc = \dfrac{(D_{30})^2}{D_{10} \times D_{60}}$

[F] If soil contains ≥ 15% sand, add "with sand" to group name.

[G] If fines classify as CL-ML, use dual symbol GC-GM, or SC-SM.

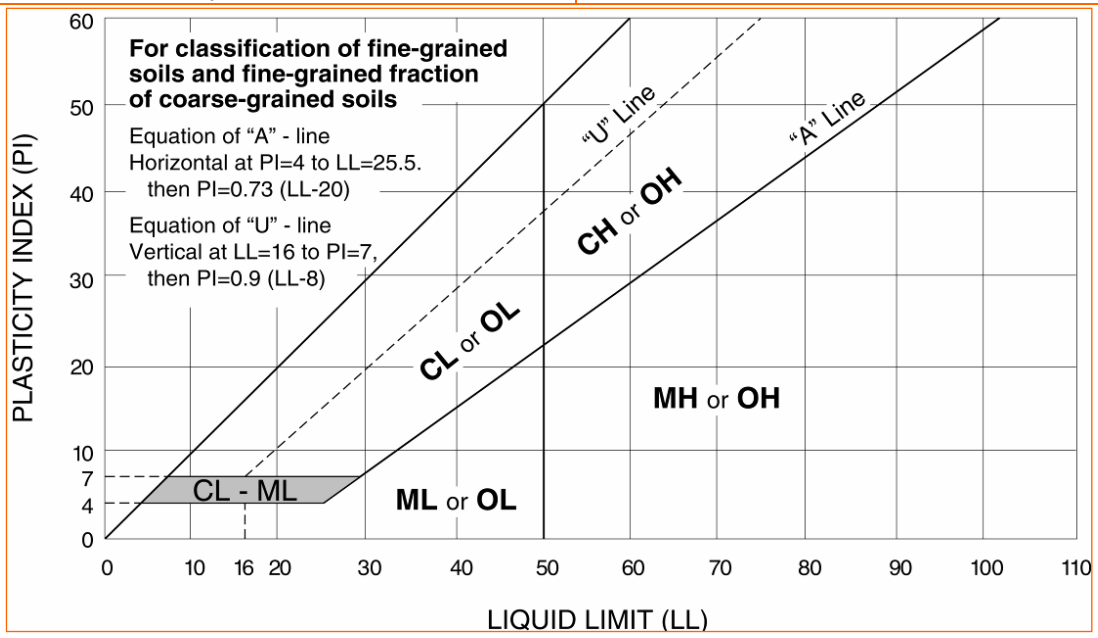
[H] If fines are organic, add "with organic fines" to group name.

[I] If soil contains ≥ 15% gravel, add "with gravel" to group name.

[J] If Atterberg limits plot in shaded area, soil is a CL-ML, silty clay.

[K] If soil contains 15 to 29% plus No. 200, add "with sand" or "with gravel," whichever is predominant.

[L] If soil contains ≥ 30% plus No. 200 predominantly sand, add "sandy" to group name.



[M] If soil contains ≥ 30% plus No. 200, predominantly gravel, add "gravelly" to group name.

[N] PI ≥ 4 and plots on or above "A" line.

[O] PI < 4 or plots below "A" line.

[P] PI plots on or above "A" line.

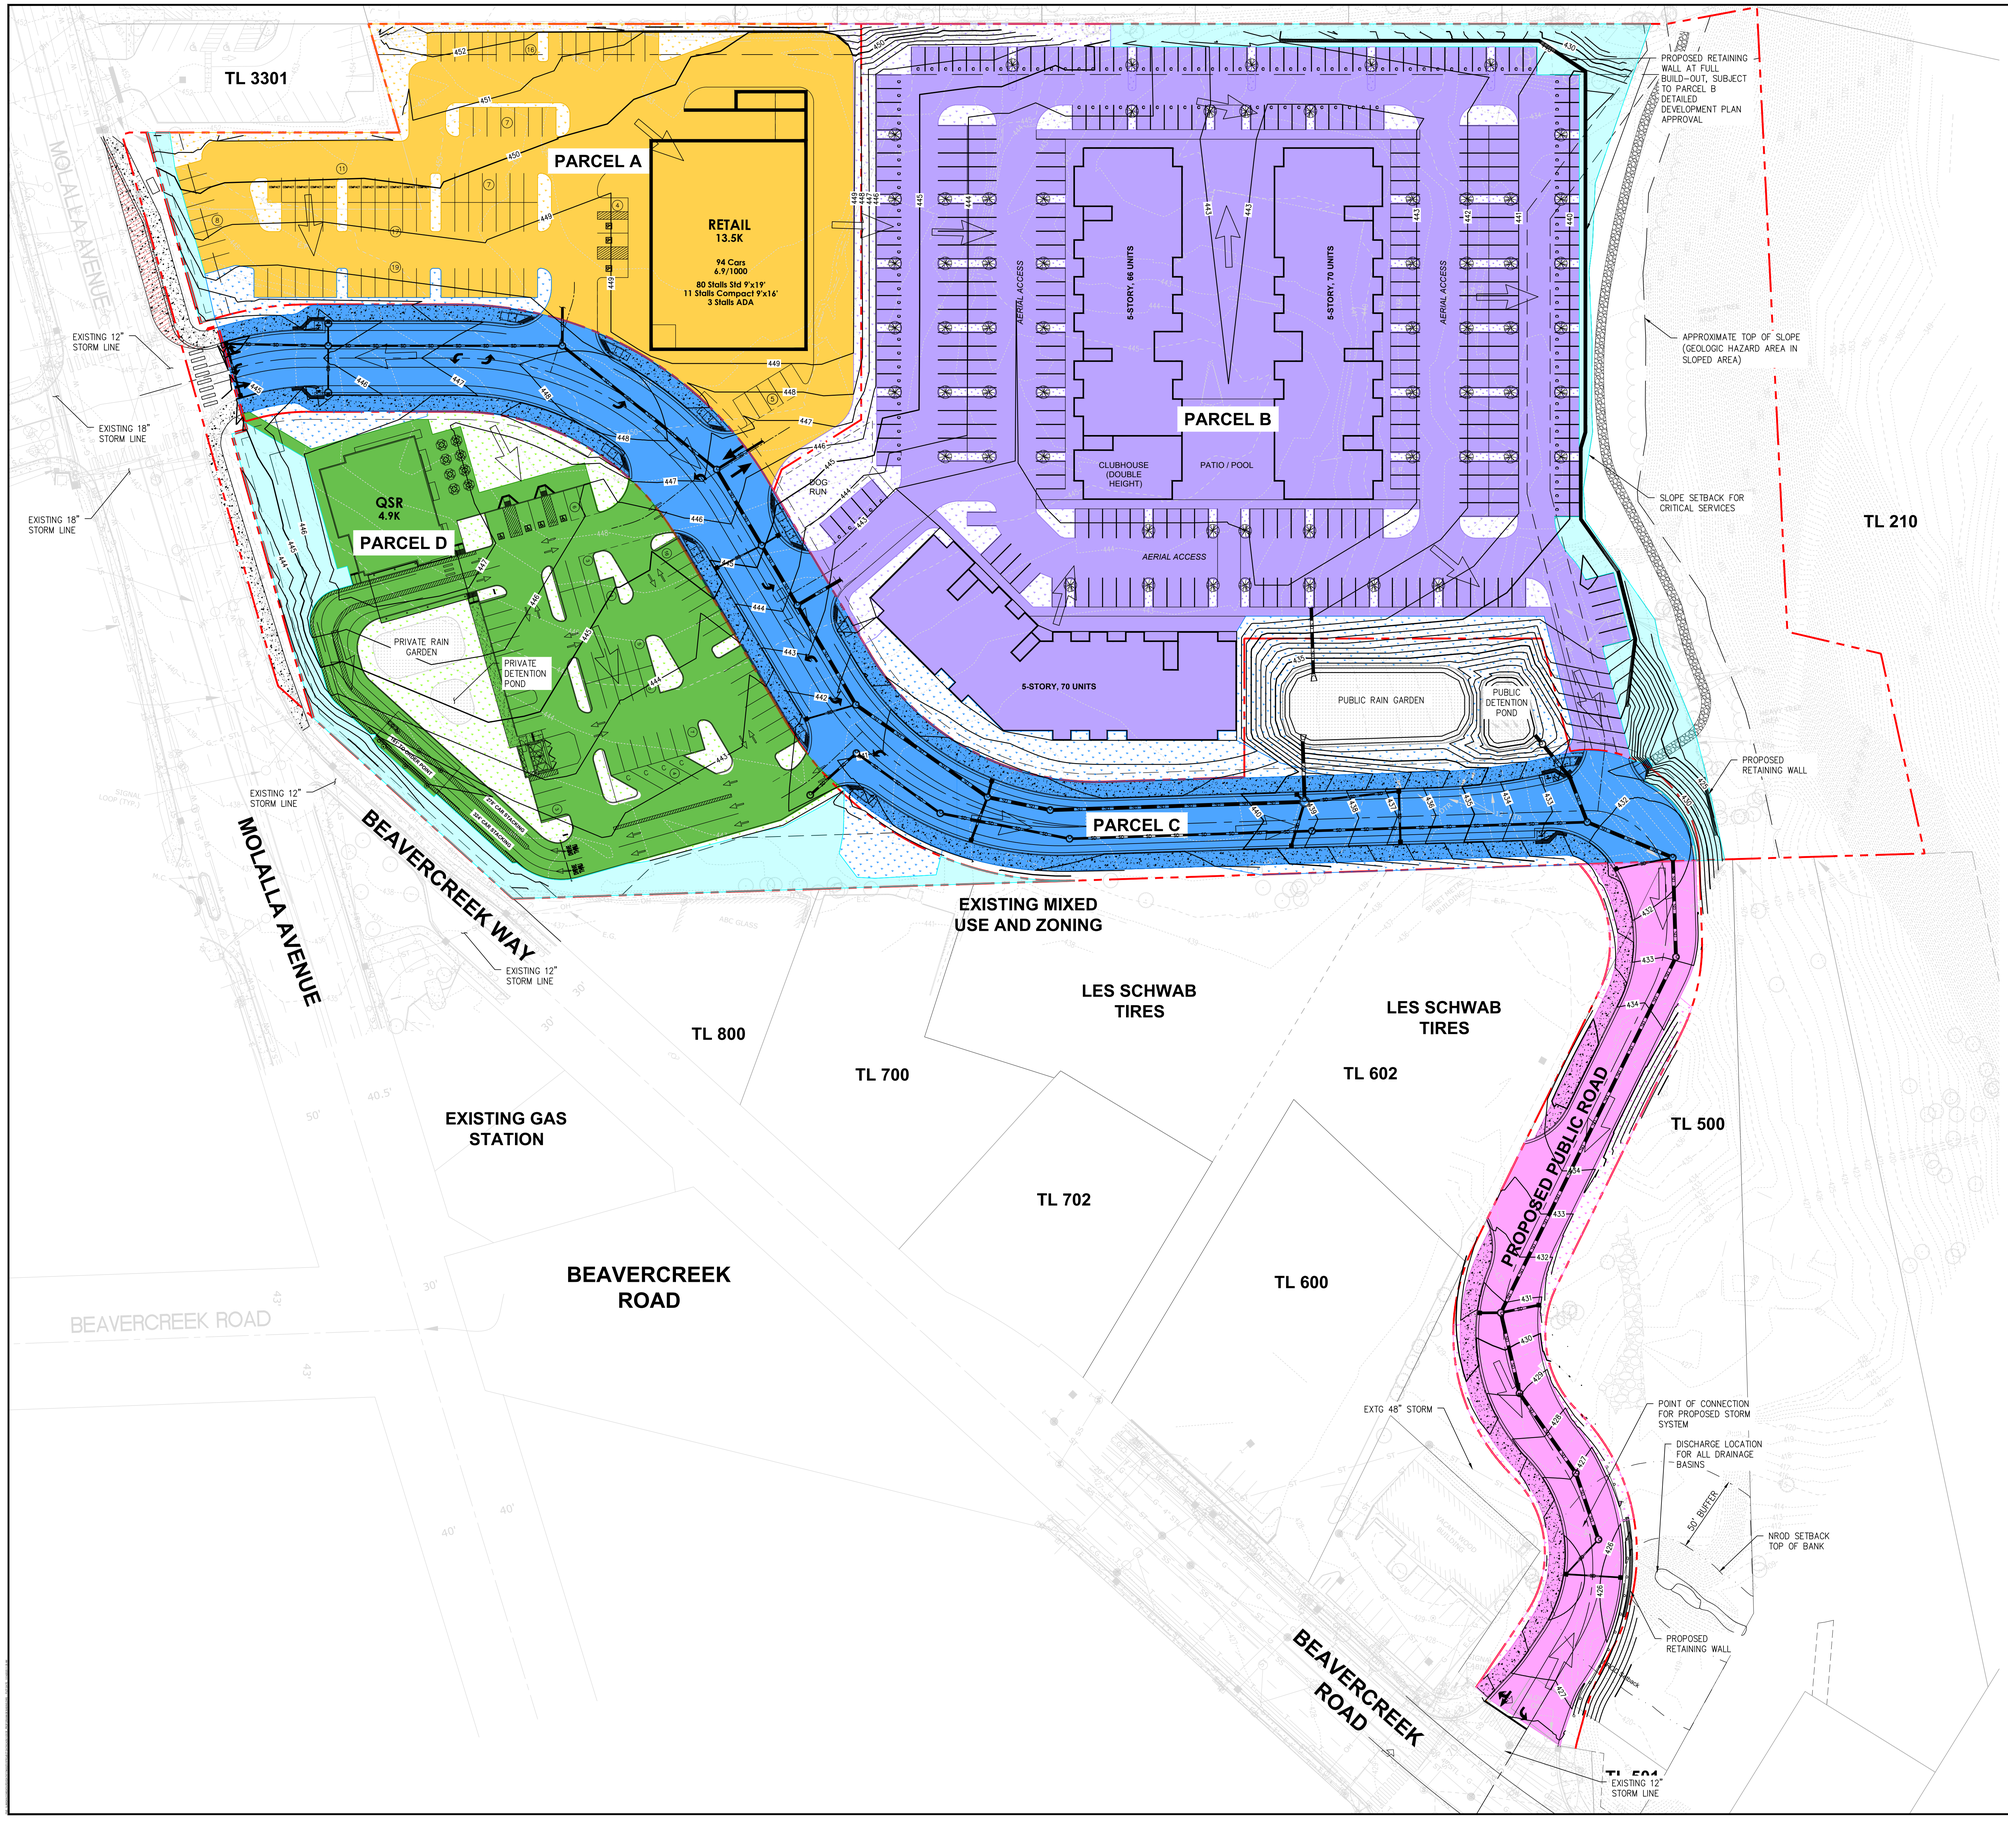
[Q] PI plots below "A" line.

WEATHERING	
Term	**Description**
Unweathered	No visible sign of rock material weathering, perhaps slight discoloration on major discontinuity surfaces.
Slightly weathered	Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discolored by weathering and may be somewhat weaker externally than in its fresh condition.
Moderately weathered	Less than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a continuous framework or as corestones.
Highly weathered	More than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a discontinuous framework or as corestones.
Completely weathered	All rock material is decomposed and/or disintegrated to soil. The original mass structure is still largely intact.
Residual soil	All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported.

STRENGTH OR HARDNESS		
Description	**Field Identification**	**Uniaxial Compressive Strength, psi (MPa)**
Extremely weak	Indented by thumbnail	40-150 (0.3-1)
Very weak	Crumbles under firm blows with point of geological hammer, can be peeled by a pocket knife	150-700 (1-5)
Weak rock	Can be peeled by a pocket knife with difficulty, shallow indentations made by firm blow with point of geological hammer	700-4,000 (5-30)
Medium strong	Cannot be scraped or peeled with a pocket knife, specimen can be fractured with single firm blow of geological hammer	4,000-7,000 (30-50)
Strong rock	Specimen requires more than one blow of geological hammer to fracture it	7,000-15,000 (50-100)
Very strong	Specimen requires many blows of geological hammer to fracture it	15,000-36,000 (100-250)
Extremely strong	Specimen can only be chipped with geological hammer	>36,000 (>250)

DISCONTINUITY DESCRIPTION			
Fracture Spacing (Joints, Faults, Other Fractures)		**Bedding Spacing (May Include Foliation or Banding)**	
Description	**Spacing**	**Description**	**Spacing**
Extremely close	< ¾ in (<19 mm)	**Laminated**	< ½ in (<12 mm)
Very close	¾ in – 2-1/2 in (19 - 60 mm)	**Very thin**	½ in – 2 in (12 – 50 mm)
Close	2-1/2 in – 8 in (60 – 200 mm)	**Thin**	2 in – 1 ft. (50 – 300 mm)
Moderate	8 in – 2 ft. (200 – 600 mm)	**Medium**	1 ft. – 3 ft. (300 – 900 mm)
Wide	2 ft. – 6 ft. (600 mm – 2.0 m)	**Thick**	3 ft. – 10 ft. (900 mm – 3 m)
Very Wide	6 ft. – 20 ft. (2.0 – 6 m)	**Massive**	> 10 ft. (3 m)

Discontinuity Orientation (Angle): Measure the angle of discontinuity relative to a plane perpendicular to the longitudinal axis of the core. (For most cases, the core axis is vertical; therefore, the plane perpendicular to the core axis is horizontal.) For example, a horizontal bedding plane would have a 0-degree angle.



ROCK QUALITY DESIGNATION (RQD) [1]	
Description	**RQD Value (%)**
Very Poor	0 - 25
Poor	25 – 50
Fair	50 – 75
Good	75 – 90
Excellent	90 - 100

1. The combined length of all sound and intact core segments equal to or greater than 4 inches in length, expressed as a percentage of the total core run length.

Terracon Project No. 82215043

Dear Mr. Rossman:

We have completed a Geotechnical Engineering evaluation for the above referenced project. Our services were performed in accordance with our Master Services Agreement dated November 20, 2017, and the Task Order dated June 22, 2021, and our Change Orders dated December 9, 2021, and June 10, 2022.

This report presents the findings of the subsurface exploration and provides geotechnical recommendations concerning slope stability, earthwork and the design and construction of foundations, floor slabs, and pavements for the proposed project.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report or if we may be of further service, please contact us.

Sincerely,
Terracon Consultants, Inc.

Ryan T. Houser, CEG

Geotechnical Engineering Report

Oregon City Development

1367 Molalla Avenue

Oregon City, Clackamas County, Oregon

Terracon Project No. 82215043

September 12, 2022

INTRODUCTION

This report presents the results of our subsurface exploration and geotechnical engineering services performed for the proposed apartment complex, retail pads, and related pavements and utilities to be located at 1367 Molalla Avenue in Oregon City, Clackamas County, Oregon. The purpose of these services is to provide information and geotechnical engineering recommendations relative to:

- Subsurface soil conditions
- Groundwater conditions
- Site preparation and earthwork
- Demolition considerations
- Excavation considerations
- Slope stability considerations
- Foundation design and construction
- Floor slab design and construction
- Seismic site class per IBC
- Lateral earth pressures
- Pavement design and construction
- Slope hazard mitigation

The geotechnical engineering Scope of Services for this project included the advancement of one drilled boring and installation of a piezometer to monitor groundwater levels. Previous investigations at the site included advancement of 29 drilled borings and excavation of 68 test pits to depths ranging from approximately 3 to 50 feet below existing site grades. Logs of current and previous explorations are included in the **Exploration Results** section.

Maps showing the site and exploration locations are shown on **Figure 1 - Site Location** and **Figures 2 through 4 - Exploration Plans** in the **Figures** section. The results of the laboratory testing performed on soil samples obtained from the site during the field exploration are included on the boring logs and/or as separate graphs in the **Exploration Results** section.

SITE CONDITIONS

The following description of site conditions is derived from our site visit in association with the field exploration and our review of publicly available topographic maps.

Item	Description
Parcel Information	The project is located at 1367 Molalla Avenue in Oregon City, Clackamas County, Oregon. The site consists of 4 tax lots totaling approximately 12.86 acres. The approximate center of the site is located at the following coordinates: ■ Latitude: 45.3356° N ■ Longitude: 122.5881° W
Existing Improvements	Former buildings were removed, although several retaining walls, foundations, and floor slabs remained as of our last site visit in 2022.
Current Ground Cover	The majority of the site was covered with grass, blackberry bushes, and scattered trees. The eastern edge of the site was densely vegetated with trees and blackberry bushes.
Existing Topography	The majority of the site consisted of three graded benches that stepped down to the east. Each bench was nearly level to gently sloping and were separated by graded slopes up to about 10 feet high with gradients up to about 3 horizontal to 1 vertical (3H:1V). The eastern edge of the site drops steeply down at inclinations in the range of 1½H:1V to ½H:1V to the east toward Newell Creek. The overall slope system height is on the order of 200 feet in vertical drop. We understand that this steep slope area contains active and ancient landslide complexes and has been studied extensively by Portland State University geologists and other researchers.

We also collected photographs at the time of our field exploration program. Representative photos are provided in our **Photography Log**.

PROJECT DESCRIPTION

Our initial understanding of the project was provided in our proposal and was discussed during project planning. Several iterations of collaboration has transpired since the project was initiated, and our final understanding of the project conditions is as follows:

Item	Description
Information Provided	The following documents were provided to us: ■ "Site Plan," Sheet 1.11, prepared by Studio 15 Architecture, Inc., dated June 4, 2021. ■ "Preliminary Existing Conditions Survey," prepared by S&F Land Services, dated June 2021. ■ Oregon City Multi-Family Concept Grading Pavement Plans, Sheets C1.0, C2.0, C2.1, C3.0, C3.1, C4.00," prepared by Kimley-Horn, dated May 27, 2022. We were also provided the geotechnical report for the original planned structure.
Project Description	The proposed development is shown on the attached **Exploration Plans** (**Figures 2 through 4**), and includes construction of: ■ 15 multi-story (2 to 3) apartment buildings with a total of 236 dwelling units. Some of the buildings will incorporate ground level parking structures with apartments above. ■ Covered parking areas (carports). ■ 2 "pad-ready" development pads along the Molalla Avenue frontage for single story retail development. ■ A clubhouse building ■ Swimming pool Associated paved parking and drive lane areas
Building Construction	The proposed apartment and clubhouse buildings will be wood-framed with a slab-on-grade ground floor.
Finished Floor Elevation	The proposed apartment complex will be developed close to existing site grades. Final finish floor elevations are undetermined at this time.
Maximum Loads (Assumed)	■ Columns: 40 kips ■ Walls: 4 kips per linear foot (klf) ■ Slabs: 150 pounds per square foot (psf)
Below-Grade Structures	Development will include construction of a subsurface utility vault that will incorporate restrained retaining walls.
Free-Standing Retaining Walls	Development may include construction of free-standing retaining walls to accommodate grade changes along the eastern edge of the site and for the southeast road extension. We understand retaining walls up to 11 feet in height may be constructed.

Item	Description
Pavements	Paved driveway and parking will be constructed on the perimeter of the site. The Site Plan indicates parking will include 423 parking spaces. Both rigid (concrete) and flexible (asphalt) pavement sections will be incorporated into the final design. Anticipated traffic is as follows: ■ Autos/light trucks: 1,393 vehicles per day ■ Light delivery and trash collection vehicles: 20 vehicles per week ■ Tractor-trailer trucks: <5 vehicles per week The pavement design period is 20 years.
Estimated Start of Construction	Summer 2023

EXISTING GEOTECHNICAL REPORTS

Our Scope of Services is based on our understanding of the project as described by The Wolff Company and the expected subsurface conditions as described below. Terracon previously completed the following reports for the project site:

- "Preliminary Results of Slope Stability Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon," prepared by Zipper Zeman Associates (ZZA, now Terracon since 2005), dated July 3, 2002.
- "Subsurface Exploration and Geotechnical Engineering Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon," prepared by ZZA, dated February 13, 2004.
- "Preliminary Engineering Geology and Soil Engineering Report, Proposed Retail Development, Molalla Avenue and Beavercreek Road Oregon City, Oregon," prepared by Terracon, dated October 8, 2012.

GEOTECHNICAL CHARACTERIZATION

Geology

The site is located in the northern Willamette Valley geologic province, which consists of a structural trough between the Coastal Range and the Cascade Range. This basin is underlain by thick deposits of sand and gravel washed into it during the Pliocene epoch when the climate in the area was very dry. These granular deposits are locally covered by the Boring lavas (Qtb) in northwest Clackamas County.

Based on the *Oregon Geologic Data Standard v. 2.1* and Oregon Department of Geology and Mineral Industries *Geologic Map of the Oregon City 7.5' Quadrangle, Clackamas County, Oregon, 2009* this site is located within a geologic unit mapped as Tbc-Basalt of Canemah defined as flow or flows of grey medium-grained, olivine basalt. The Oregon Department of Geology and Mineral Industries (DOGAMI), Bulletin 99, *Geologic Map of the Canby and Oregon City Quadrangles, Oregon 1979*, maps the site as consisting of Boring lavas (Qtb), which it describes as Pliocene-Pleistocene lavas, light-gray, open-textured olivine basalt; flow structures common; includes some pyroclastic material of local extent; widely spaced joint pattern. Lavas and breccias have weathered to a residual red clay surface soil. Vertical exposures are susceptible to mass movement and deep bedrock sliding because of failure of underlying material (see the description below with clay materials within the Troutdale unit).

The Boring Lava deposits overly the Troutdale (Tpt), which are described as Pliocene sandstone and conglomerate; indurated beds and lenses of well-sorted sand and cobbly gravel with up to 30 percent quartzite clasts. Some sand originally composed of volcanic glass have altered to an impermeable high shrink-swell clay. The clay can be unstable and cause overlying competent units to fail by landslide. The publications indicate that on slopes where this clay layer daylights, one generally encounters a spring. Also, if layers dip out of the slope, it can become a failure plane for a slump or slump-earthflow when the pore water pressure has built up to a critical value on top of the clay layer.

Based on the *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs, O-06-27, 2006* and the *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon, IMS-26, 2009,* a mapped landslide was identified adjacent to the site to the east. The landslide is identified as a prehistoric or ancient landslide (movement greater than 150 years ago). This is defined by landslide features that are slightly eroded and there is no evidence of historic (recent in last 150 years) movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

The borings completed for this report and the previously referenced 2004 ZZA report are generally consistent with the above geologic mapping for the Boring Lavas/Basalt of Canemah, although the basalt has become deeply weathered in certain areas. The Troutdale unit was not encountered to the maximum depth of the borings at approximately 90½ feet below the ground surface. Although direct evidence of landslide features were not readily observed during our exploration programs for the 2004 report, we did observe the general headscarp area of the ancient landslide area during our 2012 and 2021 slope reconnaissances with the aid of the recent Lidar-based landslide maps.

Seismic Hazards

Seismic hazards resulting from earthquake motions can include slope stability, liquefaction, and surface rupture due to faulting or lateral spreading. Liquefaction is the phenomenon wherein soil strength is dramatically reduced when subjected to vibration or shaking.

We reviewed the Statewide Geohazards Viewer (HazVu) published by the Oregon Department of Geology and Mineral Studies (DOGAMI) and available online[1]. The viewer categorizes the expected earthquake shaking from light, moderate, strong, very strong, severe and violent; and the landslide susceptibility from low, moderate, high, and very high.

- Earthquake Liquefaction Hazard: Non-Liquefiable
- Expected Earthquake Shaking: Very Strong
- Landslide Susceptibility (due to earthquake): Low (Landsliding Unlikely) on the majority of the site, with Moderate (Landsliding Possible) to Very High (Existing Slide) on the eastern margin of the site. See **Engineering Geology Update** section for additional discussion.

Faults

The United States Geological Survey (USGS) Quaternary Fault and Fold Database of the United States published a report containing descriptions of nearby faults. Faults in the project vicinity include the Bolton fault (No.874), the Oatfield fault (No.875), and the Portland Hills fault (No.877). Published information pertaining to each fault or fault zone is provided in the following tables:

Bolton fault (Class B) No. 874

Information	Description
Length	9 km
Strike (degrees)	N53°W
Sense of Movement	Reverse
Dip Direction	SW
Slip-rate Category	Less than 0.2 mm/yr
Most recent prehistoric deformation	Undifferentiated Quaternary (<1.6 Ma)
Distance from Fault	1 km NE

[1] Statewide Geohazards Viewer (HazVu) published by the Oregon Department of Geology and Mineral Industries (DOGAMI) https://gis.dogami.oregon.gov/hazvu/

Oatfield fault (Class A) No. 875

Information	Description
Length	29 km
Strike (degrees)	N41W
Sense of Movement	Reverse, Right lateral
Dip Direction	NE
Slip-rate Category	Less than 0.2 mm/yr
Most recent prehistoric deformation	Undifferentiated Quaternary (<1.6 Ma)
Distance from Fault	2 km NNE

Portland Hills fault (Class A) No. 877

Information	Description
Length	49 km
Strike (degrees)	N37°W
Sense of Movement	Reverse, Right lateral
Dip Direction	SW
Slip-rate Category	Less than 0.2 mm/yr
Most recent prehistoric deformation	Undifferentiated Quaternary (<1.6 Ma)
Distance from Fault	5 km NE

Based on our review of the available fault information, the depth to bedrock, and the site's proximity to the nearest known faults, it is our opinion that the risk of surface rupture due to ground faulting is low.

Groundwater Conditions

We observed our explorations while drilling and after completion for the presence and level of groundwater. The water levels observed in the explorations are provided on the boring logs in **Exploration Results**, and are summarized below.

Boring Number	Approximate Ground Surface Elevation (feet) [1]	Observation Date	Approximate Depth to Groundwater/ Seepage while Drilling/Excavating (feet) [1]
02-B-3	447	October 29, 2001	19
02-B-22	451	March 7, 2002	20
02-MW-1	445	October 31, 2001	14
02-MW-1	445	November 2, 2001	8
02-MW-3	456	October 31, 2001	16
02-MW-3	456	November 2, 2001	17.5
02-MW-4	447	October 31, 2001	15
02-MW-4	447	November 2, 2001	11.2
02-MW-5	445	October 31, 2001	15
02-MW-5	445	November 2, 2001	11.5
02-TP-8	445	November 1, 2001	11
02-TP-43	426	March 4, 2002	9
02-TP-1A	435	March 1, 2002	9
02-TP-8A	442	March 1, 2002	6½
02-TP-12A	452	March 2, 2002	4
02-TP-20A	452	March 2, 2002	9½
21-B-1[2]	429	December 2021 – July 1, 2022	(not encountered)

1. Based on elevations obtained from the site topographic plan. Elevations may differ from those presented on the attached logs, which were based on a previous topographic map of the site.
2. A vibrating wire piezometer was installed at a depth of 30¾ feet below the ground surface (bgs), at the top of the basaltic bedrock.

Groundwater observations presented above appear to represent perched groundwater and does not appear to be continuous in nature. Groundwater level fluctuations occur due to seasonal variations in the amount of rainfall, runoff and other factors not evident at the time the borings were performed. Therefore, groundwater levels during construction or at other times in the life of the structure may be higher or lower than the levels indicated on the boring logs. The possibility of groundwater level fluctuations should be considered when developing the design and construction plans for the project.

A vibrating wire piezometer was installed in Boring 21-B-1 near the top of the descending slope at the east end of the site. The instrument was placed immediately above the basaltic andesite within the boring at a depth of approximately 30 feet bgs. As of the date of this report, groundwater

was not recorded by this instrument. Groundwater levels will continue to be measured within this boring throughout 2022.

GeoModel

We have developed a general characterization of the subsurface conditions based upon our review of the subsurface exploration, laboratory data, geologic setting and our understanding of the project. This characterization, termed GeoModel, forms the basis of our geotechnical calculations and evaluation of site preparation and foundation options. Conditions encountered at each exploration point are indicated on the individual logs. The individual logs can be found in the **Exploration Results** section and the GeoModel can be found on **Sections A-A', B-B', and C-C'** (Figures 10 through 12) in the **Figures** section of this report. As part of our analyses, we identified the following model layers within the subsurface profile.

Model Layer	Layer Name	General Description
1	**Existing Fill**	Topsoil, Asphalt, Silty Sand Fill, Clayey Silt Fill, Poorly Graded Gravel Fill, Gravelly Silt Fill placed during previous grading at the site
2	**Residual Soil (Native)**	Silt with trace Clay, Clayey Sand with Gravel, contains a variable amount of basaltic andesite boulders and cobbles
3	**Boring Lava**	Basaltic Andesite, fresh to slightly weathered, slightly fractured to very fractured

ENGINEERING GEOLOGY UPDATE

Terracon previously prepared an engineering geology report for the site, the results of which were presented in our referenced October 8, 2012, report. A copy of the 2012 report is attached at the end of this report. As part of our current scope of work, Terracon performed an engineering geology reconnaissance of the site slopes to document current site conditions. In addition, we reviewed aerial photographs, geologic maps, and geologic hazard maps produced since completion of our 2012 report, as detailed in the following sections.

RESEARCH

Geologic and Geologic Hazards Maps Review

Terracon reviewed the following geologic and geologic hazard maps that include the project site that have become available since our 2012 reports were issued:

- 2012 Oregon Department of Geology and Mineral Industries (DOGAMI) Open-File Report O-12-02, Lidar-based surficial geologic map and database of the greater Portland, Oregon, area, Clackamas, Columbia, Marion, Multnomah, Washington, and Yamhill Counties, Oregon,

and Clark County, Washington, by Lina Ma, Ian P. Madin, Serin Duplantis, and Kendra J. Williams

- 2013 DOGAMI Open-File Report O-13-08, Landslide hazard and risk study of northwestern Clackamas County, Oregon, by William J. Burns, Katherine A. Mickelson, Cullen B. Jones, Sean G. Pickner, Kaleena L. B. Hughes, and Rachel Sleeter.
- 2020 U.S. Geological Survey Scientific Investigations Map SIM-3443, Geologic map of the greater Portland metropolitan area and surrounding region, Oregon and Washington, by Wells, R.E., Haugerud, R.A., Niem, A.R., Niem, W.A., Ma, Lina, Evarts, R.C., O'Connor, J.E., Madin, I.P., Sherrod, D.R., Beeson, M.H., Tolan, T.L., Wheeler, K.L., Hanson, W.B., and Sawlan, M.G.

Based on our review, the geologic mapping presented on these maps is consistent with the mapped publications discussed in our referenced engineering geology report. The Landslide Hazard mapping (2013) indicates the eastern portion of the site, including the area of the headscarp and recommended setback, has a "high" potential for deep-seated landslides. The mapping indicates the eastern approximate quarter of the area of proposed development has a "moderate" potential for deep-seated landslides. The shallow landslide potential is "high" along the landslide scarp, and "moderate" directly above the landslide scarp. The slope between the site and the residential properties to the north also shows a "moderate" potential for shallow landslides. The landslide hazard susceptibility depicted on these maps is consistent with those discussed in the referenced reports prepared for the site. Portions of the landslide susceptibility maps showing the approximate site boundaries are attached as **Figure 6 - Deep Landslide Susceptibility Map** and **Figure 7 - Shallow Landslide Susceptibility Map** in the **Figures** section of this report.

Aerial Photograph Review

We reviewed aerial photographs taken from 2012 to 2020 showing the site to determine if significant changes to vegetation or slope configuration are apparent, which may indicate a slope failure. Our aerial photograph review did not identify any areas showing significant changes to vegetation or slope configuration on the scarp; however, two areas below the landslide headscarp showed vegetation patterns that appeared to be inconsistent with the surrounding areas. These areas were specifically visited during our site reconnaissance, which is described in the following section.

ENGINEERING GEOLOGIC RECONNAISSANCE

Terracon Consultants, Inc., Project Geologist Ryan T. Houser, CEG, performed a surface reconnaissance of the subject property and adjacent slopes on July 1, 2021.

The property was bordered to the west by Molalla Avenue, to the north by single-family and multi-family residences fronting on Hilltop Avenue, to the south by businesses fronting on Beavercreek

Road, and to the east by a forested natural area (Newell Creek Canyon Natural Area). The majority of the site consisted of three graded benches that stepped down to the east. Each bench was nearly level to gently sloping and were separated by graded slopes up to about 10 feet high with gradients up to about 3 horizontal to 1 vertical (3H:1V). Topography of the site is consistent with that shown on the existing conditions survey map provided by the client, as shown on **Figure 8 - Topographic Map** in the **Figures** section of this report. Photographs taken at the time of our reconnaissance are presented in the **Photography Log**.

The former building pad portions of the site above the headscarp were vacant and free of structures. This portion of the site appeared to be in a condition virtually identical to that described in the referenced reports. No signs of slope instability were noted on this portion of the site.

The headscarp appeared to be in a condition identical to that described in the referenced reports, with no indicators of additional failures noted during our reconnaissance. The slope was generally vegetated with fir and oak trees. The majority of the trees on the slope exhibited straight trunks. We noticed several recent treefalls on the slope, which appeared to be the result of wind and/or ice and not slope failures since the disturbed soils were limited to the root wads of the fallen trees.

The areas of variable vegetation noted during our review of aerial photographs were located near the toe of the headscarp within the natural area, as shown on **Figure 9 - Reconnaissance Plan** in the **Figures** section of this report. Both areas contained vegetation different than the surrounding trees. The soils in these areas had a higher moisture content than the slope or surrounding areas at the base of the headscarp. A spring was located at the base of the slope east of the northeastern property corner at the northern “wet soils” area shown on **Figure 9 - Reconnaissance Plan** in the **Figures** section of this report. Based on topography, these areas represent “sag ponds” that often form at the base of headscarps after a landslide. In this case, the sag ponds did not contain standing water but did maintain a higher soil moisture content than the surrounding soils that was not conducive to tree growth. The areas surrounding the sag ponds were vegetated with mature trees, with no indications of recent reactivations of the landslide.

SEISMIC CONSIDERATIONS

Seismic Design

The seismic design requirements for structures are based on the Seismic Design Category. Site Classification is required to determine the Seismic Design Category for a structure. The Site Classification is based on the upper 100 feet of the site profile defined by a weighted average value of either shear wave velocity, standard penetration resistance, or undrained shear strength in accordance with Section 20.4 of ASCE 7-16.

Description	Value
2019 Oregon Structural Specialty Code (OSSC) [1]	D[2]
Site Latitude	45.3360°N
Site Longitude	122.5880°W
S_S MCE_R Ground Motion for a Short Period [3]	0.812g
S_1 MCE_R Ground Motion for a 1-Second Period [3]	0.366g
PGA_M Site Modified Peak Ground Acceleration	0.451

1. Seismic site classification in general accordance with the *2019 Oregon Structural Specialty Code (OSSC)*, which refers to ASCE 7-16.
2. ASCE 7-16 requires a site soil profile extending to a depth of 100 feet be used for seismic site classification. Borings at this site were extended to a maximum depth of 90½ feet. The site properties below the boring depth to 100 feet were estimated based on our experience and knowledge of geologic conditions of the general area.
3. These values were obtained using online seismic design maps and tools available on the Applied Technology Council (ATC) website referenced in Section 1613.2.1 of the 2019 OSSC.

Liquefaction

Liquefaction is the phenomenon where saturated soils develop high pore-water pressures during seismic shaking and lose their strength characteristics. This phenomenon generally occurs in areas of high seismicity, where groundwater is shallow and loose granular soils or relatively low- to non-plastic fine-grained soils are present.

Based on their plasticity characteristics, the shallow high-plasticity soils are considered non-liquefiable. Based on their very stiff/dense nature, the underlying residual soil is considered non-liquefiable within the depths explored. In addition, relatively shallow, non-liquefiable basaltic andesite bedrock underlies the site. These findings are consistent with liquefaction hazard mapping for the site described above, which indicates soils at the site are non-liquefiable.

SLOPE STABILITY

Published geologic maps referenced in the attached October 8, 2012, engineering geology report and in the **Engineering Geology Update** section referenced above indicate that shallow surficial landsliding and debris flows are the primary types of slope failure in Newell Creek Canyon. In addition, recent hazard mapping indicates a moderate to high risk of deep-seated failures on the eastern portion of the site. It is our opinion that the previously discussed deep-seated failure of the mapped landslide was due to significant undercutting of lower-strength materials that underly the basalt by the ancestral Newell Creek. The resultant landslide debris covered the lower strength materials, forcing Newell Creek further to the east. In our opinion, the landslide debris and current location of Newell Creek provide a level of protection against erosion of the lower

strength materials, and a reduced risk of deep seated failures for the life of the current development.

Mechanics of Stability

Slope stability analyses take into consideration material strength, presence and orientation of weak layers, water (piezometric) pressures, surcharge loads, and the slope geometry. Mathematical computations are performed using computer-assisted simulations to calculate a Factor of Safety (FS). Minor changes to slope geometry, surface water flow and/or groundwater levels could result in slope instability. Reasonable FS values are dependent upon the confidence in the parameters utilized in the analyses performed, among other factors related to the project itself.

Geometric Analysis Results

Slope stability analyses were performed for the cross-section geometries based on the provided topographic map and publicly available topographic information. Parameters for the analyses were derived from our exploration program, experience, and laboratory tests. Stability analyses were conducted using the computer program Slope/W Version 7.16 developed by Geo-Slope International.

Unstable or Potentially Unstable Slopes

Based on the results of our field investigation, laboratory testing program, and geotechnical analysis, development of the site is considered feasible from a geotechnical viewpoint provided the conclusions and considerations provided herein are incorporated into the design and construction of the project. A horizontal acceleration of 0.225 (1/2 of the PGA_M) was entered for the seismic stability calculations.

The stability of the slopes at the cross-section locations shown on **Figure 3 –Exploration Plan East** were analyzed based on the provided topography, proposed grading, soil properties derived from our geotechnical exploration, laboratory test results and our experience with similar soil conditions. Soil and bedrock properties used in the analyses are shown below:

Material	Moist Unit Weight (pcf)	Drained Cohesion (psf)	Drained Friction Angle (degrees)
Existing Fill	120	0	27
Proposed Fill	125	0	32
Probable Slide Material	120	100	5
Residual Soil	125	250	30
Fresh Bedrock	150	500	45

Based on the analyses, the calculated FS for the critical surface identified in each section is shown below. It's important to note that these results incorporate the planned grading at this time. However, these analyses do not include any risk mitigation elements recommended later in this section.

Cross-Section	Minimum Calculated Factor-of-Safety for Slopes With Proposed Grading (no mitigation)	
	Static	Seismic
A-A'	1.65	1.06
B-B'	1.36	0.81
C-C'	1.91	1.17

The typically accepted minimum FS for static long-term slope stability supporting improvements is 1.5, and 1.15 for seismic slope stability. As shown in the table above, the proposed fill placement at the top of the slope will result in a factor of safety below the accepted minimums.

Slope Hazard Mitigation Recommendations

We evaluated multiple slope stability mitigation options including the use us deep foundations to support the proposed parking areas, the use of lightweight fill materials, and incorporating geogrid into the new structural fill areas. Based on our analyses, we recommend the proposed retaining wall incorporate a row of soldier piles to reinforce the top of the slope. The soldier piles should consist of a row of drilled shaft cast-in-place concrete piers. In addition, we recommend buildings setback a minimum of 35 feet from the top of the headscarp at the east end of the site. This line is shown on the attached **Figure 9 - Reconnaissance Map** and **Figure 3 - Exploration Plan East**. These piles should be embedded a minimum of 5 feet into the bedrock materials. Additional discussion of these recommendations is provided in **Geotechnical Overview** section. Details of the pile recommendations are provided in the **Soldier Pile Walls** section.

Incorporating these recommendations into the slope stability analyses results in the following calculated FS for the critical surfaces:

Cross-Section	Minimum Calculated Factor-of-Safety for Slopes Mitigated with Soldier Piles	
	Static	Seismic
A-A'	2.48	1.61
B-B'	2.87	1.56
C-C'	2.80	1.75

While these factors of safety appear significantly higher than the goal of design of 1.5 for static and 1.15 for seismic, these are the minimums provided the piles are embedded into the bedrock. Our analyses for piles not embedded into the bedrock did not achieve adequate factors of safety. As indicated in the preceding table, installation of soldier piles will provide sufficient increase in

the factors of safety. The slope stability results for each cross section representing the proposed grading incorporating soldier piles are included as **Figures 13 through 18** in the **Figures** section of this report.

GEOTECHNICAL OVERVIEW

Based on the results of our slope stability and engineering analyses, it is our opinion that the proposed development is feasible from the geotechnical engineering standpoint. The primary geotechnical considerations for development of the site are:

- **Existing Landslide Hazard:** As indicated above, we recommend the retaining wall at the east end of the site incorporate a row of soldier piles to aid in slope stability. The soldier piles should consist of drilled shaft cast-in-place concrete piers that are designed to provide lateral support for new fill and existing native soils (above the bedrock) west of the proposed retaining wall. Soldier pile recommendations are provided in the **Soldier Pile Walls** section. In addition, we recommend a 35-foot building setback from the top of the descending slope at the east end of the site (See **Figure 3 - Exploration Plan East**). The recommended setback is for habitable structures, so minor encroachments of parking and grading can be considered an acceptable use provided the following considerations are incorporated into final grading plans in order to minimize impact to slope stability:
  - Drainage should be controlled so that no water is discharged onto or over the descending slope.
  - Additional area loading of the top of the slope should be avoided (i.e. no additional fill that would increase weight at the top of the slope beyond that included in our slope stability model as shown on the proposed grading plan and cross sections).

- **Existing Fill Pad:** Up to about 7 feet of undocumented fill soils underlie the proposed parking and drive lane area at the east end of the site. “Undocumented” fill is fill that lacks documentation regarding its subgrade conditions or evaluation of compaction while it was placed. Due to the potential of long-term settlement of such fill, we recommend the fill be removed and replaced with properly placed and compacted structural fill as described in the **Earthwork** section. The approximate area of the fill (based on topography) is shown on **Figure 8 - Topographic Map**.

- **Previous Tank Excavations:** Several underground storage tanks related to a former gas station were removed from within the southwest corner of the site in the parking area southwest of southern building pad fronting on Molalla Avenue. The approximate location of the former gas station is shown on the **Figure 8 - Topographic Map**. We are not aware of density test or observation reports regarding the placement of backfill within the excavations remaining after removal of the tanks. Therefore, we recommend the fill be treated as “undocumented,” and that it be removed and replaced with properly placed and compacted

structural fill. The suitability of existing fill for reuse as structural fill can be evaluated during construction. As an alternative, additional test pits could be advanced into the existing fill to determine if it can be reused as structural fill.

- **Moisture Sensitivity:** The near surface, silt soils could become unstable with typical earthwork and construction traffic, especially after precipitation events. The effective drainage should be completed early in the construction sequence and maintained after construction to avoid potential issues. If possible, the grading should be performed during the warmer and drier times of the year. If grading is performed during the winter months, an increased risk for possible undercutting and replacement of unstable subgrade will persist. Additional site preparation recommendations, including subgrade improvement and fill placement, are provided in the **Earthwork** section.

The **General Comments** section provides an understanding of the report limitations.

EARTHWORK

Earthwork is anticipated to include demolition, clearing and grubbing, excavations, and fill placement. The following sections provide recommendations for use in the preparation of specifications for the work. Recommendations include critical quality criteria, as necessary, to render the site in the state considered in our geotechnical engineering evaluation for foundations, floor slabs, and pavements.

Site Preparation

Prior to placing new fill, existing vegetation and root mat should be removed. Complete stripping of the topsoil should be performed in the proposed building and parking/driveway areas. Existing pavements, foundations, subsurface structures, and utilities remaining from previous development should be removed in their entirety. Existing fill soils should be removed and replaced with controlled structural fill.

The subgrade should be proof rolled with an adequately loaded vehicle such as a fully-loaded tandem-axle dump truck. The proof rolling should be performed under the direction of the Geotechnical Engineer. Areas excessively deflecting under the proof roll should be delineated and subsequently addressed by the Geotechnical Engineer. Such areas should either be removed or modified by stabilizing with cement. Excessively wet or dry material should either be removed or moisture conditioned and recompacted.

Terracon completed an Environmental Site Assessment (ESA) report for the project under separate cover. The ESA indicates contaminated soils within portions of the former wrecking yard at the east end of the site near the top of the descending slope. Any contaminated soils removed

near the top of the descending slope during remediation practices should be replaced with properly controlled, low-permeability structural fill soils. A former fueling station was also identified on the western portion of the site. We understand that the fuel tank was previously removed and the resulting excavation was loosely backfilled with excavated soils. The contractor should be aware that earthwork activities associated with the proposed development may encounter contaminated native and/or undocumented fill soils within these areas. The ESA reports completed for the site should be thoroughly reviewed prior to the start of earthwork activities.

Existing Fill

As noted in **Geotechnical Characterization**, many of the explorations encountered existing fill to depths of up to about 7 feet. The consistency/density of the fill is highly variable. Therefore, we recommend the fill be completely removed and replaced with properly placed and compacted structural fill in proposed building and pavement areas. Removal of undocumented fill soils should extend a minimum of 10 feet beyond building and pavement areas. Once materials have been removed, the entire area should be proof rolled with heavy, rubber tire construction equipment, to aid in delineating areas of soft or otherwise unsuitable soil. Areas of soft or otherwise unsuitable material should be undercut and replaced with either new structural fill or suitable, existing on site materials. Once unsuitable materials have been remediated, and the subgrade has passed the proof roll test, the existing and undocumented fill that was removed can be evaluated for reuse as structural fill.

Subgrade Stabilization

For this site, improvement of working surfaces subgrade with Portland cement could be considered. Cement amendment of soils should be performed by a pre-qualified contractor having experience with successfully stabilizing subgrades in the project area on similar sized projects with similar soil conditions.

For planning purposes, we estimate that pavement subgrades would need to be amended with an approximate 7 to 8 percent cement by dry weight in order to provide a stabilized subgrade for both wet weather and pavement support. We recommend a cement-amendment design be prepared during the full design phase to refine this estimate for construction specifications.

Fill Material Types

Fill required to achieve design grades should be classified as select fill, structural fill and general fill. Select fill is material used below turbine foundations, whereas structural fill is material used above or within 10 feet of foundation structures and within roadways or constructed slopes. General fill is material used to achieve grade outside of these structural areas. Fill materials used should meet the following material property requirements:

Soil Type[1]	Specification	Acceptable Parameters (for Structural Fill)
Common Fill	2021 ODOT Standard Specifications for Construction (ODOT SSC) Section 00330.13 Selected General Backfill[2]	All locations across the site, except beneath footing pads Dry weather only
Granular Common Fill	ODOT SSC Section 0030.13 Selected General Backfill[3]	All locations across the site. Dry weather only
Select Fill	ODOT SSC Section 00330.14 Selected Granular Backfill[4]	All locations across the site. Wet and Dry weather acceptable.
Crushed Aggregate Base (CAB)	ODOT SSC Section 02630.10 Dense Graded Aggregate (2"-0 to 1"-0) with the modification that less than 8% pass the No. 200 sieve as determined by ASTM D 422.	Finished base course materials for roadways and footing subgrades.
Lean Concrete (Mud-Mat)	ODOT SSC 00442 with the exception that minimum 28-day strength shall be 500 psi. Higher strength minimums may be specified by the Structural Engineer as needed.	All locations underneath mat foundations and spread foundations.

1. Controlled, compacted fill should consist of approved materials that are free (free = less than 3% by weight) of organic matter and debris (i.e. wood sticks greater than ½ inch in diameter). Frozen material should not be used, and fill should not be placed on a frozen subgrade. A sample of each material type should be submitted to the geotechnical engineer for evaluation.
2. Material should have a liquid limit less than 40 and plasticity index of less than 10.
3. Material should have less than 50% passing the No. 200 sieve and be non-plastic in nature.
4. Material should have a maximum aggregate size of 2 inches and no more than 8% passing the No. 200 sieve by weight determined by ASTM D 422.
5. Decomposed bedrock and basalt bedrock can be used as fill/backfill provided it is properly processed to a "soil-like consistency" to meet the USCS Classifications presented above with no pieces larger than 2 inches.
6. The contractor shall select the appropriate material for use based on the current and forecasted weather conditions at the time of construction.

Fill Compaction Requirements

Recommended compaction and moisture content criteria for structural fill materials are as follows:

Material Type and Location	Minimum Compaction Requirement (%)	Range of Moisture Contents for Compaction	
		Minimum	Maximum
Common Fill	**Per the Modified Proctor Test (ASTM D 1557)**		
All locations where used	95	-2%	+2%
Select Fill & CAB	**Per the Modified Proctor Test (ASTM D 1557)**		

Material Type and Location	Minimum Compaction Requirement (%)	Range of Moisture Contents for Compaction	
		Minimum	Maximum
All locations where used (e.g. beneath foundations, slabs, pavements)	95	-4%	+2%

Utility Trench Backfill

For low permeability subgrades, utility trenches are a common source of water infiltration and migration. Utility trenches penetrating beneath the buildings should be effectively sealed to restrict water intrusion and flow through the trenches, which could migrate below the buildings. The trench should provide an effective trench plug that extends at least 5 feet from the face of building exteriors. The plug material should consist of cementitious flowable fill or low permeability clay. The trench plug material should be placed to surround the utility line. If used, the clay trench plug material should be placed and compacted to comply with the water content and compaction recommendations for structural fill stated previously in this report.

Grading and Drainage

All grades must provide effective drainage away from the buildings during and after construction and should be maintained throughout the life of the structure. Water retained next to the buildings can result in soil movements greater than those discussed in this report. Greater movements can result in unacceptable differential floor slab and/or foundation movements, cracked slabs and walls, and roof leaks. The roofs should have gutters/drains with downspouts that discharge onto splash blocks at a distance of at least 10 feet from the buildings.

Exposed ground should be sloped and maintained at a minimum 5% away from the buildings for at least 10 feet beyond the perimeter of the buildings. Locally, flatter grades may be necessary to transition ADA access requirements for flatwork. After building construction and landscaping have been completed, final grades should be verified to document effective drainage has been achieved. Grades around the structure should also be periodically inspected and adjusted, as necessary, as part of the structure's maintenance program. Where paving or flatwork abuts the structure, a maintenance program should be established to effectively seal and maintain joints and prevent surface water infiltration.

Earthwork Construction Considerations

Shallow excavations for the proposed structures are anticipated to be accomplished with conventional construction equipment. Upon completion of filling and grading, care should be taken to maintain the subgrade water content prior to construction of floor slabs. Construction traffic over the completed subgrades should be avoided. The site should also be graded to prevent ponding of surface water on the prepared subgrades or in excavations. Water collecting over or

adjacent to construction areas should be removed. If the subgrade freezes, desiccates, saturates, or is disturbed, the affected material should be removed, or the materials should be scarified, moisture conditioned, and recompacted prior to floor slab construction.

As a minimum, excavations should be performed in accordance with OSHA 29 CFR, Part 1926, Subpart P, “Excavations” and its appendices, and in accordance with any applicable local, and/or state regulations.

Construction site safety is the sole responsibility of the contractor who controls the means, methods, and sequencing of construction operations. Under no circumstances shall the information provided herein be interpreted to mean Terracon is assuming responsibility for construction site safety, or the contractor's activities; such responsibility shall neither be implied nor inferred.

Construction Observation and Testing

The earthwork efforts should be monitored under the direction of the Geotechnical Engineer. Monitoring should include documentation of adequate removal of vegetation and topsoil, proof rolling, and mitigation of areas delineated by the proof roll to require mitigation.

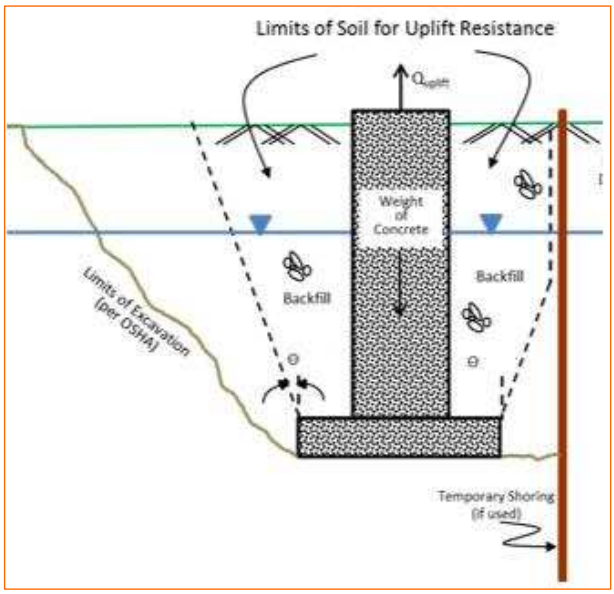
Each lift of compacted fill should be tested, evaluated, and reworked, as necessary, until approved by the Geotechnical Engineer prior to placement of additional lifts. Each lift of fill should be tested for density and water content at a frequency of at least one test for every 2,500 square feet of compacted fill in the building areas and 5,000 square feet in pavement areas. One density and water content test should be performed for every 50 linear feet of compacted utility trench backfill. In areas of foundation excavations, the bearing subgrade should be evaluated under the direction of the Geotechnical Engineer. If unanticipated conditions are encountered, the Geotechnical Engineer should prescribe mitigation options.

In addition to the documentation of the essential parameters necessary for construction, the continuation of the Geotechnical Engineer into the construction phase of the project provides the continuity to maintain the Geotechnical Engineer’s evaluation of subsurface conditions, including assessing variations and associated design changes.

SHALLOW FOUNDATIONS

If the site has been prepared in accordance with the requirements noted in the **Earthwork** section, the following design parameters are applicable for shallow foundations.

Design Parameters – Compressive Loads

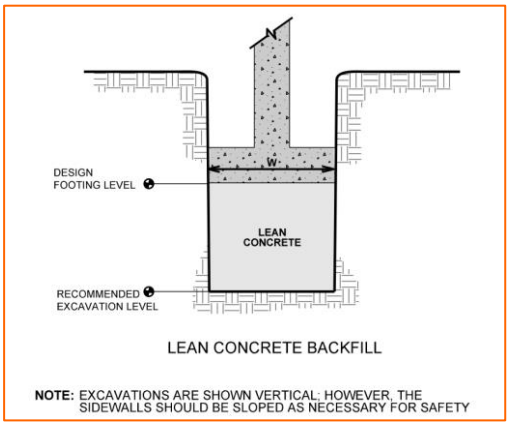


Item	Description
Maximum Net Allowable Bearing Pressure[1,2]	2,000 psf
Required Bearing Stratum[3]	Structural fill or undisturbed native residual soil
Minimum Foundation Dimensions	Columns: 24 inches Continuous: 18 inches
Ultimate Passive Resistance[4] **(equivalent fluid pressures)**	150 pcf (cohesive backfill) 360 pcf (granular backfill)
Ultimate Coefficient of Sliding Friction[5]	0.30 (native silt soils) 0.50 (granular structural fill material)
Minimum Embedment below Finished Grade[6]	Exterior footings in unheated areas: 12 inches Exterior footings in heated areas: 12 inches Interior footings in heated areas: 12 inches
Estimated Total Settlement from Structural Loads[2]	Less than about 1 inch
Estimated Differential Settlement[2,7]	About ⅔ of total settlement

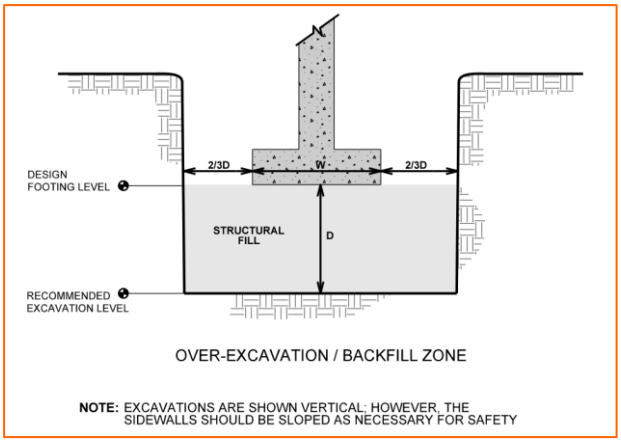
1. The maximum net allowable bearing pressure is the pressure in excess of the minimum surrounding overburden pressure at the footing base elevation. An appropriate factor of safety has been applied. Values assume that exterior grades are no steeper than 20% within 10 feet of structure.
2. Values provided are for maximum loads noted in **Project Description**.
3. Unsuitable or soft soils should be overexcavated and replaced per the recommendations presented in the **Earthwork**.
4. Use of passive earth pressures require the sides of the excavation for the spread footing foundation to be nearly vertical and the concrete placed neat against these vertical faces or that the footing forms be removed and compacted structural fill be placed against the vertical footing face.
5. Can be used to compute sliding resistance where foundations are placed on suitable soil/materials. Should be neglected for foundations subject to net uplift conditions.
6. Embedment necessary to minimize the effects of frost and/or seasonal water content variations. For sloping ground, maintain depth below the lowest adjacent exterior grade within 5 horizontal feet of the structure.
7. Differential settlements are as measured over a span of 50 feet.

Design Parameters - Uplift Loads

Uplift resistance of spread footings can be developed from the effective weight of the footing and the overlying soils. As illustrated on the subsequent figure, the effective weight of the soil prism defined by diagonal planes extending up from the top of the perimeter of the foundation to the ground surface at an angle, θ, of 20 degrees from the vertical can be included in uplift resistance. The maximum allowable uplift capacity should be taken as a sum of the effective weight of soil plus the dead weight of the foundation, divided by an appropriate factor of safety. A maximum



total unit weight of 100 pcf should be used for the backfill. This unit weight should be reduced to 40 pcf for portions of the backfill or natural soils below the groundwater elevation.



Foundation Construction Considerations

As noted in **Earthwork**, the footing excavations should be evaluated under the direction of the Geotechnical Engineer. The base of all foundation excavations should be free of water and loose soil, prior to placing concrete. Concrete should be placed soon after excavating to reduce bearing soil disturbance. Care should be taken to prevent wetting or drying of the bearing materials during construction. Excessively wet or dry material or any loose/disturbed material in the bottom of the footing excavations should be removed/reconditioned before foundation concrete is placed.

If unsuitable bearing soils are encountered at the base of the planned footing excavation, the excavation should be extended deeper to suitable soils, and the footings could bear directly on these soils at the lower level or on lean concrete backfill placed in the excavations. This is illustrated on the sketch below.

Overexcavation for structural fill placement below footings should be conducted as shown below. The overexcavation should be backfilled up to the footing base elevation, with structural fill placed, as recommended in the **Earthwork** section.

FLOOR SLABS

Depending upon the finished floor elevation, unsuitable, undocumented fills may be encountered at the floor slab subgrade levels. These soils should be replaced with structural fill so the floor slab is supported on suitable natural soils or newly placed structural fill.

Design parameters for floor slabs assume the requirements for **Earthwork** have been followed. Specific attention should be given to positive drainage away from the structure and positive drainage of the aggregate base beneath the floor slab.

Floor Slab Design Parameters

Item	Description
Floor Slab Support [1]	Minimum 6 inches of free-draining (less than 6% passing the U.S. No. 200 sieve) crushed aggregate compacted to at least 95% of ASTM D 698 [2, 3]
Estimated Modulus of Subgrade Reaction [2]	100 pounds per square inch per inch (psi/in) for point loads

1. Floor slabs should be structurally independent of building footings or walls to reduce the possibility of floor slab cracking caused by differential movements between the slab and foundation.
2. Modulus of subgrade reaction is an estimated value based upon our experience with the subgrade condition, the requirements noted in **Earthwork**, and the floor slab support as noted in this table. It is provided for point loads. For large area loads the modulus of subgrade reaction would be lower.
3. Free-draining granular material should have less than 5% fines (material passing the No. 200 sieve). Other design considerations such as cold temperatures and condensation development could warrant more extensive design provisions.

The use of a vapor retarder should be considered beneath concrete slabs on grade covered with wood, tile, carpet, or other moisture sensitive or impervious coverings, or when the slab will support equipment sensitive to moisture. When conditions warrant the use of a vapor retarder, the slab designer should refer to ACI 302 and/or ACI 360 for procedures and cautions regarding the use and placement of a vapor retarder.

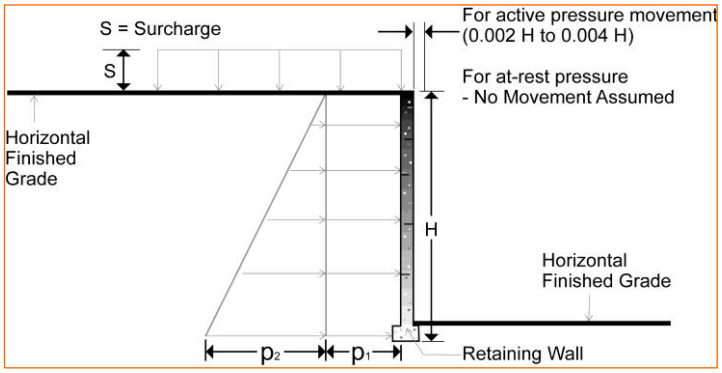
Saw-cut control joints should be placed in the slab to help control the location and extent of cracking. For additional recommendations refer to the ACI Design Manual. Joints or cracks should be sealed with a water-proof, non-extruding compressible compound specifically recommended for heavy duty concrete pavement and wet environments.

Where floor slabs are tied to perimeter walls or turn-down slabs to meet structural or other construction objectives, our experience indicates differential movement between the walls and slabs will likely be observed in adjacent slab expansion joints or floor slab cracks beyond the length of the structural dowels. The Structural Engineer should account for potential differential settlement through use of sufficient control joints, appropriate reinforcing or other means.

Mitigation measures, as noted in **Existing Fill** within the **Earthwork** section, are critical to the performance of floor slabs. In addition to the mitigation measures, the floor slab can be stiffened by adding steel reinforcement, grade beams and/or post-tensioned elements.

Floor Slab Construction Considerations

Finished subgrade, within and for at least 10 feet beyond the floor slab, should be protected from traffic, rutting, or other disturbance and maintained in a relatively moist condition until floor slabs are constructed. If the subgrade should become damaged or desiccated prior to construction of floor



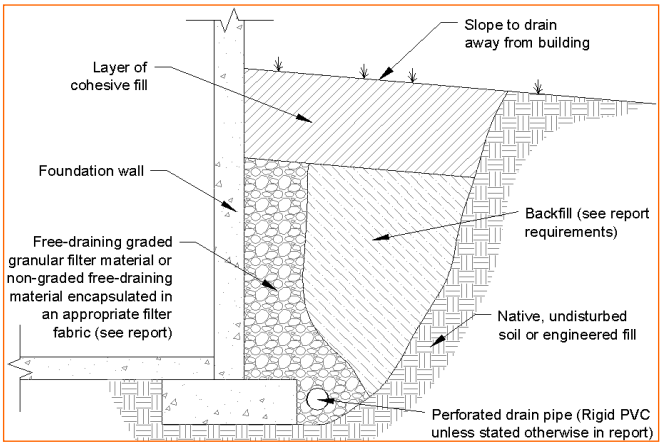
slabs, the affected material should be removed and structural fill should be added to replace the resulting excavation. Final conditioning of the finished subgrade should be performed immediately prior to placement of the floor slab support course.

The Geotechnical Engineer should approve the condition of the floor slab subgrades immediately prior to placement of the floor slab support course, reinforcing steel, and concrete. Attention should be paid to high traffic areas that were rutted and disturbed earlier, and to areas where backfilled trenches are located.

LATERAL EARTH PRESSURES

Design Parameters

Structures with unbalanced backfill levels on opposite sides should be designed for earth pressures at least equal to values indicated in the following table. Earth pressures will be influenced by structural design of the walls, conditions of wall restraint, methods of construction and/or compaction and the strength of the materials being restrained. Two wall restraint conditions are shown in the diagram below. Active earth pressure is commonly used for design of free-standing cantilever retaining walls and assumes wall movement. The “at-rest” condition assumes no wall movement and is commonly used for basement walls, loading dock walls, or other walls restrained at the top. The recommended design lateral earth pressures do not include a factor of safety and do not provide for possible hydrostatic pressure on the walls (unless stated).



Lateral Earth Pressure Design Parameters				
Earth Pressure Condition [1]	Coefficient for Select Fill Backfill [2]	Surcharge Pressure [3, 4, 5] p_1 (psf)	Effective Fluid Pressures (psf) [2, 4, 5]	
			Unsaturated [6]	Submerged [6]
Active (Ka)	0.31	(0.27)S	(35)H	0.27
At-Rest (Ko)	0.47	(0.43)S	(55)H	0.43
Passive (Kp)	3.25	---	(480)H	3.69

1. For active earth pressure, wall must rotate about base, with top lateral movements 0.002 H to 0.004 H, where H is wall height. For passive earth pressure, wall must move horizontally to mobilize resistance.
2. Uniform, horizontal backfill, compacted to at least 95% of the ASTM D 1557 maximum dry density, rendering a maximum unit weight of 120 pcf.
3. Uniform surcharge, where S is surcharge pressure.
4. Loading from heavy compaction equipment is not included.
5. No safety factor is included in these values.
6. To achieve "Unsaturated" conditions, follow guidelines in Subsurface Drainage for Below-Grade Walls section below. "Submerged" conditions are recommended when drainage behind walls is not incorporated into the design.

Backfill placed against structures should consist of granular soils or low plasticity cohesive soils. For the granular values to be valid, the granular backfill must extend out and up from the base of the wall at an angle of at least 45 and 60 degrees from vertical for the active and passive cases, respectively.

Subsurface Drainage for Below-Grade Walls

A perforated rigid plastic drain line installed behind the base of walls and extends below adjacent grade is recommended to prevent hydrostatic loading on the walls. The invert of a drain line around a below-grade building area or exterior retaining wall should be placed near foundation bearing level. The drain line should be sloped to provide positive gravity drainage to daylight or to a sump pit and pump. The drain line should be surrounded by clean, free-draining granular material having less than 5% passing the No. 200 sieve, such as No. 57 aggregate. The free-draining aggregate should be encapsulated in a filter fabric. The granular fill should extend to within 2 feet of final grade, where it should be capped with compacted cohesive fill to reduce infiltration of surface water into the drain system.

As an alternative to free-draining granular fill, a pre-fabricated drainage structure may be used. A pre-fabricated drainage structure is a plastic drainage core or mesh which is covered with filter fabric to prevent soil intrusion, and is fastened to the wall prior to placing backfill.

SOLDIER PILE WALLS

Based on the slope stability analyses and the proposed development plan, we recommend that the retaining wall along the east end of the proposed fill pad be supported on deep foundations consisting of a row of cast in place concrete piles. Based on our analyses, the piles should be spaced no more than 8 feet apart. The piles should be embedded a minimum of 5 feet into the basalt bedrock encountered at the site, and should be designed to retain the proposed structural fill (under the parking and drive lanes), and underlying native residual soils to the surface of the bedrock. Based on our explorations, the surface of the bedrock ranges from about 20 to 33 feet below site grades along the wall alignment. This depth will likely have more variation during construction to the variable thickness of the fill present at the site.

Lateral Earth Pressures

Based on slope stability analyses attached to this report, we recommend the piles be designed to retain the soils from the proposed finished grade to the surface of the basalt bedrock. The parameters defined in the table below should be utilized in the design of the drilled shafts to determine required embedment depth and spacing, taking into consideration a minimum spacing between piles of 8 feet along the top of the slope and a minimum embedment of 5 feet into the bedrock. Additional embedment into the bedrock may be necessary to provide adequate resistance to overturning.

The design of lateral earth stabilization piers is conventionally accomplished using empirical relationships and apparent earth pressure distributions. These earth pressure distributions or envelopes do not represent the precise distribution of earth pressures but rather constitute

hypothetical pressures from loads can be calculated which would not likely be exceeded in the event of a landslide.

Design of these systems could be based on either “active” or “at-rest” lateral earth pressures, depending on the degree of deformation that can be tolerated. Piers which are free to deform on the order of 0.001 to 0.002 times the height of the exposed potential height is considered to be capable of mobilizing active earth pressures. This lateral deformation is likely to be accomplished by vertical settlement of up to roughly 0.002 times the height of the piers, which may extend back from the side of the slide face a distance equal to roughly the height of the exposed height. A greater amount of lateral deformation could allow greater vertical settlements. Since there are structural elements within the zone considered to be at risk during a potential slide, we believe it is appropriate to design utilizing at-rest earth pressures.

An assumed “at-rest” earth pressure condition theoretically assumes no movement of the soil behind the stabilization piers; however, some settlement should realistically be anticipated due to construction practices and/or the fact that it is not possible to construct a perfectly stiff system and the space between the piers are reliant on soil arching for support should be piers be exposed.

Material	Equivalent Fluid Weight		Strength Parameters (Drained)	
	At Rest (pcf)	Allowable Passive (pcf)	Drained Cohesion (psf)	Drained Friction Angle (degrees)
Existing Fill	120	320	0	27
Proposed Fill	125	407	0	32
Residual Soil	125	375	250	30
Fresh Bedrock	150	874	500	45

In the table above, the at-rest pressures act on the pile spacing above the bedrock and on the pier diameter below that depth. The passive pressures act on twice the pier diameter. We recommend a minimum pier embedment of at least 5 feet into competent basalt bedrock.

Construction Considerations

If soldier piles are installed prior to removal of the existing debris-laden undocumented fill, caving conditions should be expected in the fill materials. Therefore, drilled shaft excavations may require the use of temporary casing and drilling fluid to maintain integrity of the excavation walls and bottom. Groundwater was not encountered within the anticipated depth of drilling, but isolated perched zones may be encountered within the residual soil or at the top of the underlying bedrock, particularly following periods of heavy rainfall. Thick drilling fluid and/or casing may be required to offset the groundwater and caving conditions. Following completion of the excavation and prior

to installing reinforcement or concrete the bottom of the shaft must be cleaned of any soft or loose material.

Caving of the sidewalls and/or heaving of the shaft bottoms may occur during wet weather conditions. We recommend that the contractor be prepared to use casing and/or slurry installation methods in the event that wall sloughing, caving, or heave occurs. The contractor should also be equipped to clean out the bottom of the shafts if loose soil is observed or suspected.

If less than 3 inches of water is present in the bottom of the excavation, groundwater seepage into the excavation is at a rate of no more than 12 inches per hour and the shaft diameter is greater than or equal to 3 feet; concrete may be placed by free-fall. Under free-fall placement, deposit concrete through the center of the reinforcement cage by a method which prevents segregation of aggregates and splashing of concrete on the reinforcement cage. Place concrete so that the free-fall is vertical down the center of the shaft without hitting the sides, the steel reinforcing bars or steel cage bracing.

If the drilled shaft does not meet the above requirements, we recommend placing concrete from the bottom of the holes with a tremie pipe to form a continuous column and prevent aggregate separation. Concrete should be placed with a higher than average slump into the excavation through a tremie pipe extending to the bottom of the excavation. An uninterrupted supply and placement of concrete should be performed to produce a monolithic pier. Use clean, watertight tremie pipes large enough in diameter to allow the free flow of concrete. The tremie pipes should be placed within one to two feet above the bottom of the excavation prior to the commencement of concrete placement. Maintain a minimum 5 feet embedment of the tremie pipe in the concrete during concrete placement.

The bottom of the shaft must be observed or tested to verify that all loose material has been removed and dense granular soil is exposed. The contractor should review the conditions encountered and reported on the boring logs and in this report and provide appropriate equipment to excavate the shafts to the design depths at this site.

Reinforcing steel and concrete should be placed inside the temporary casing. The casing should be pulled as the concrete is placed to provide final contact between the soil and the concrete. A minimum head of 5 feet of concrete should be maintained above the lower edge of the casing as it is pulled to prevent intrusion of soil during extraction.

PAVEMENTS

General Pavement Comments

Pavement designs are provided for the traffic conditions and pavement life conditions as noted in **Project Description** and in the following sections of this report. A critical aspect of pavement performance is site preparation. Pavement designs noted in this section must be applied to the site which has been prepared as recommended in the **Earthwork** section.

Pavement Design Parameters

Design of Asphaltic Concrete (AC) pavements are based on the procedures outlined in the American Association of State Highway and Transportation Officials (AASHTO), 1993. Design of Portland Cement Concrete (PCC) pavements are based upon American Concrete Institute (ACI) 330; Guide for Design and Construction of Concrete Parking Lots.

A subgrade CBR of 9 (from attached laboratory testing) was used for the AC pavement designs, and a modulus of subgrade reaction (k) of 100 pci was used for the PCC pavement designs where subgrade stabilization consisting of CAB or cement treated soil is employed. The values were empirically derived based upon our experience with the fine-grained subgrade soils and our understanding of the quality of the subgrade as prescribed by the **Site Preparation** conditions as outlined in **Earthwork**. A modulus of rupture of 580 psi was used for pavement concrete.

Pavement Section Thicknesses with Subgrade Stabilization

As a minimum, we suggest the following pavement section be considered:

Asphaltic Concrete Design		
Layer	Thickness (inches)	
	Light Duty [1]	Heavy Duty [1]
AC [2]	3	4
Aggregate Base [3]	7	8

1. See **Project Description** for more specifics regarding Light Duty and Medium Duty traffic.
2. All materials should meet the Oregon Department of Transportation (ODOT) Standard Specifications for Construction (2018).
   - Asphaltic Surface - ODOT Type A Asphaltic Cement Concrete: Section 00744
   - Asphaltic Base - ODOT Type B Asphaltic Cement Concrete, Class I: Section 00745
3. A minimum 1.5-inch surface course should be used on ACC pavements.

Portland Cement Concrete Design		
Layer	Thickness (inches)	
	Light Duty [1]	Heavy Duty [3]
PCC [2]	5	6
Aggregate Base [3]	7	8

1. See **Project Description** for more specifics regarding traffic classifications.
2. All materials should meet the current State Department of Transportation ODOT) Standard Specifications for Highway and Construction (2018).
   - Concrete Pavement - ODOT Portland Cement Concrete Type C: Section 00756
3. In areas of anticipated heavy traffic, fire trucks, delivery trucks, or concentrated loads (e.g. dumpster pads), and areas with repeated turning or maneuvering of heavy vehicles.

We understand that typical fire departments require that the proposed pavement sections at the site will support a fire emergency truck once the apartment complex is constructed. Typically, we estimate total fire-truck load of 80,000 pounds for a three axle (single tire) truck. Based on these assumptions and the proposed loading conditions, we computed the ultimate bearing capacity of the pavement sections relative to a 20 percent increase of the factored load of the fire truck. From a bearing failure standpoint, the Truck Loading Section pavements are estimated to be adequate for support of the fire truck vehicle (with a factor of safety of 2.5). Pavement areas may experience some localized cracking from these large fire truck vehicle loads but are not expected to experience bearing failure of the pavement section. Based on this analysis, it is our opinion that pavement will provide adequate support for the temporary use of an emergency fire truck at the site.

Pavement Drainage

Pavements should be sloped to provide rapid drainage of surface water. Water allowed to pond on or adjacent to the pavements could saturate the subgrade and contribute to premature pavement deterioration. In addition, the pavement subgrade should be graded to provide positive drainage within the granular base section. The subgrade and the pavement surface should have a minimum ¼ inch per foot slope to promote drainage. Appropriate sub-drainage or connection to a suitable daylight outlet should be provided to remove water from the base layer.

Pavement Maintenance

The pavement sections represent minimum recommended thicknesses and, as such, periodic maintenance should be anticipated. Therefore, preventive maintenance should be planned and provided for through an on-going pavement management program. Maintenance activities are intended to slow the rate of pavement deterioration and to preserve the pavement investment. Maintenance consists of both localized maintenance (e.g., crack and joint sealing and patching) and global maintenance (e.g., surface sealing). Preventive maintenance is usually the priority when implementing a pavement maintenance program. Additional engineering observation is

recommended to determine the type and extent of a cost-effective program. Even with periodic maintenance, some movements and related cracking may still occur and repairs may be required. Pavement performance is affected by its surroundings. In addition to providing preventive maintenance, the civil engineer should consider the following recommendations in the design and layout of pavements:

- Final grade adjacent to paved areas should slope down from the edges at a minimum 2%.
- Subgrade and pavement surfaces should have a minimum 2% slope to promote proper surface drainage.
- Install below pavement drainage systems surrounding areas anticipated for frequent wetting.
- Install joint sealant and seal cracks immediately.
- Seal all landscaped areas in or adjacent to pavements to reduce moisture migration to subgrade soils.
- Place compacted, low permeability backfill against the exterior side of curb and gutter.
- Place curb, gutter and/or sidewalk directly on clay subgrade soils rather than on unbound granular base course materials.

GENERAL COMMENTS

Our analysis and opinions are based upon our understanding of the project, the geotechnical conditions in the area, and the data obtained from our site exploration. Natural variations will occur between exploration point locations or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. Terracon should be retained as the Geotechnical Engineer, where noted in this report, to provide observation and testing services during pertinent construction phases. If variations appear, we can provide further evaluation and supplemental recommendations. If variations are noted in the absence of our observation and testing services on-site, we should be immediately notified so that we can provide evaluation and supplemental recommendations.

Our Scope of Services does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

Our services and any correspondence or collaboration through this system are intended for the sole benefit and exclusive use of our client for specific application to the project discussed and are accomplished in accordance with generally accepted geotechnical engineering practices with no third-party beneficiaries intended. Any third-party access to services or correspondence is solely for information purposes to support the services provided by Terracon to our client. Reliance upon the services and any work product is limited to our client, and is not intended for

third parties. Any use or reliance of the provided information by third parties is done solely at their own risk. No warranties, either express or implied, are intended or made.

Site characteristics as provided are for design purposes and not to estimate excavation cost. Any use of our report in that regard is done at the sole risk of the excavating cost estimator as there may be variations on the site that are not apparent in the data that could significantly impact excavation cost. Any parties charged with estimating excavation costs should seek their own site characterization for specific purposes to obtain the specific level of detail necessary for costing. Site safety, and cost estimating including, excavation support, and dewatering requirements/design are the responsibility of others. If changes in the nature, design, or location of the project are planned, our conclusions and recommendations shall not be considered valid unless we review the changes and either verify or modify our conclusions in writing.

Terracon Project No. 82125030

Dear Mr. Vanderdasson:

Terracon Consultants, Inc. (Terracon) is pleased to present our *Preliminary Engineering Geology and Soil Engineering Report* for the Proposed Retail Development project in Oregon City, Oregon. Our services were completed in general accordance with our *Proposal for Geotechnical Engineering Services – Revised* (P82110035R1), dated July 20, 2012. Email authorization to proceed with our services was provided by PACLAND on July 20, 2012. This report presents our preliminary conclusions regarding the stability of the slopes and soils from the proposed development.

We appreciate the opportunity to be of service to you on this project. If you have any questions concerning this report, or if we may be of further service, please contact us.

Sincerely,
Terracon Consultants, Inc.

Exhibit A-3	Preliminary Geologic Cross Section
Exhibit A-4	Preliminary Static Slope Stability
Exhibit A-5	Preliminary Seismic Slope Stability

EXECUTIVE SUMMARY

The site's geology and associated geologic hazards were researched with regard to the proposed site development. The preliminary engineering geology and geotechnical considerations associated with the proposed project are summarized below.

- **Existing, Adjacent Landslide Hazards:** The steep slope area to the east is a well-documented landslide hazard area. However, the area immediately adjacent to the site is mapped as an ancient landslide. Recent surface reconnaissance of the steep slope area does not indicate recent movement of the weathered landslide features.

- **Proposed Development Feasibility:** The proposed development is feasible from a geotechnical standpoint provided structures, significant fills, and other loads are located outside a suitable setback. Previous engineering studies established a setback of 35 feet from the top of slope and may be used for planning purposes of the new development.

- **Retaining Walls:** A retaining wall is proposed along the east side of the truck route at the currently proposed 35-foot top of slope setback. Additional engineering design will be necessary for the retaining wall, although our preliminary slope stability models indicate the walls are setback sufficiently from the top of the slope and should not adversely impact the stability of the slope.

- **Site Drainage and Erosion Control:** Surface water should be collected and routed away from the steep slope area. Infiltration facilities should not be implemented due to the potential for the infiltrated water to daylight on the adjacent steep slope areas and decrease slope stability. The area within the setback at the top of the slope may be cleared of invasive vegetation, such as blackberries, and suitably vegetated to reduce erosion towards the steep slope area.

This summary should be used in conjunction with the entire report for design purposes. It should be recognized that details were not included or fully developed in this section, and the report must be read in its entirety for a comprehensive understanding of the items contained herein. The **GENERAL COMMENTS** section should be read for an understanding of the report limitation.

PRELIMINARY ENGINEERING GEOLOGY AND SOIL ENGINEERING REPORT PROPOSED RETAIL DEVELOPMENT MOLALLA AVENUE AND BEAVERCREEK ROAD OREGON CITY, OREGON

Project No. 82125030
October 8, 2012

1.0 INTRODUCTION

In accordance with your request and written authorization, Terracon has completed a Preliminary Engineering Geology and Soil Engineering Evaluation for the proposed retail development in Oregon City, Oregon. Terracon, formerly Zipper Zeman Associates (ZZA), previously completed the following reports:

- Preliminary Results of Slope Stability Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon, by ZZA, dated July 3, 2002.
- Subsurface Exploration and Geotechnical Engineering Evaluation, Proposed Retail Project, Molalla Avenue and Beavercreek Road, Oregon City, Oregon, by ZZA, dated February 13, 2004.

2.0 PURPOSE AND SCOPE

The purpose of this report is to satisfy the requirement for both a Preliminary Engineering Geology Report and a Preliminary Soil Engineering Report as required by the Oregon City Geologic Hazards Checklist. An updated geotechnical engineering report will be provided at a later date with engineering recommendations to be used for final design of the development.

Our scope of services included a slope reconnaissance, review of previous subsurface boring and test pit explorations, review of published geologic literature, preliminary geotechnical engineering analysis, and preparation of this report.

3.0 PROJECT INFORMATION

3.1 Site Location

ITEM	DESCRIPTION
Location	The site is located at the northeast corner of Molalla Avenue and Beavercreek Road in Oregon City, Oregon as shown in Exhibit A-1 – Site Plan.
Existing improvements	The site is currently vacant and fenced off. All former buildings have been razed, although several slab and foundations remain. Several retaining walls and/or slopes on the order of 4 feet or less in height are on the site.
Surroundings	The site is bounded by single and multi-family residences to the north, Molalla Avenue and commercial properties to the west, commercial properties to the south, and an undeveloped steep slope area dropping off to the east.
Current ground cover	The site is covered with grass, shrubs (blackberries, etc.), and scattered to dense stands of trees. The southeast portion of the site is wooded, and the entire south edge of the property is overgrown with dense blackberry shrubs.
Existing topography	The majority of the site is relatively flat with several low retaining walls creating broad terraces stepping down to the east. The eastern edge of the site drops steeply down at inclinations in the range of 1½H:1V to ½H:1V to the east toward Newell Creek. The overall slope system height is on the order of 200 feet in vertical drop. We understand that this steep slope area contains active and ancient landslide complexes and has been studied extensively by Portland State University geologists and other researchers.

3.2 Project Description

ITEM	DESCRIPTION
Structures	Main Retail Building The project will include a new one-story retail building and loading dock with a proposed total footprint of approximately 60,000 square feet (SF). The building footprint is planned in the northeast portion of the site as shown on the attached Site Plan. Outlots 1- 4 Four outlots are currently planned for the western third of the site for three retail buildings ranging from approximately 3,600 SF to 7,200 SF and a one- to two-story commercial/office building of approximately 23,000 SF. Outlot 2 will potentially include a remote drive-thru banking structure.
Building construction	Main Retail Building We have assumed that the store will be constructed with masonry block load-bearing and non-load-bearing walls; steel columns, girders, and joists for support of the roof structure; and on-grade cast-in-place floor slabs. Outlots 1-4 No information is available on the outlot buildings, but we assume they will be either wood-framed or masonry block construction with slab-on-grade floors.
Finished floor elevations	Main Retail Building: Currently planned at elevation 445 feet. Outlot 1: Currently planned at elevation 448 feet. Outlot 2: Currently planned at elevation 444 feet. Outlot 3: Currently planned at elevation 442 feet. Outlot 4: Currently planned at elevation 448 feet.
Maximum loads	Main Retail Building Columns: 85 kips gravity and 150 kips maximum live loading. Walls: 1.5 to 2 klf non-load bearing and 4 to 6 klf for load bearing. Slabs: 125 psf uniform loading and 5-kip concentrated loading max. Outlot Buildings The loads for these buildings are not known at this time, but are assumed to not exceed those listed above for the main retail building.

ITEM	DESCRIPTION
Maximum allowable settlement	Main Retail Building Total Static Settlement: 1 inch Masonry Walls: L/900 or ½ inch over 40 feet Outlots Total Static Settlement: 1 inch (assumed) Differential: L/900 or ½ inch over 40 feet (assumed)
Grading	Significant fills on the order of 10 to 12 feet in maximum thickness are expected on the east half of the site and in the building pad. Excavation cuts (or removal of stockpile areas) up to approximately 10 feet may be needed in the proposed truck route off the southeast corner of the site in the existing stockpile areas.
Cut and fill slopes	3H:1V slopes approximately 4 feet or less in height are expected.
Free-standing retaining walls	An approximately 626-foot long by 5- to 12-foot high retaining wall is planned along the east edge of the truck route outside the steep slope setback. Guards rails and/or fall protection fencing are anticipated atop the retaining walls. Determination of the wall type, e.g., segmental block, soldier pile, etc., has not yet been determined along the east side of the truck route but will be determined as part of the final design to include slope stability concerns.
Below Grade Areas	A loading dock area is planned on the northeast corner of the building with a finish grade of 4 feet below the finish floor elevation.
Stormwater Management	A buried detention structure is planned in the southeast corner of the site under the parking area. We understand that the depth of the structure is currently planned at approximately 7 feet below finish grade.
Off-site Improvements	A public road and truck route is proposed from the southeast corner of the site south to Beavercreek Road.
Buried Utilities	We understand that stormwater and water pipes will run along the truck route on the east side of the site. Depths are anticipated to be 10 feet or less. A sanitary sewer line is proposed to run east-west from Molalla between Outlot 2 and Outlot 3 to the main retail building. The sanitary sewer will also run north-south up the Outlot 2 parking lot north to Outlots 1 and 4. Depths have not been determined yet, but may exceed 10 feet in depth.

4.0 LITERATURE REVIEW

Per Oregon City Municipal Code 17.44.050, we reviewed the following documents for this report:

- The State of Oregon Department of Geology and Mineral Industries (DOGAMI) in Bulletin 99, Geology and Geological Hazards of North Clackamas County, Oregon (1979), or in any subsequent DOGAMI mapping for the Oregon City area;
- Portland State University study entitled “Environmental Assessment of Newell Creek Canyon, Oregon City, Oregon (1992);
- Portland State University study, "Landslides in the Portland, Oregon, Metropolitan Area Resulting from the Storm of February 1996: Inventory Map, Database and Evaluation" (Burns and others, 1998);
- DOGAMI Open File Report O-06-27, "Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from LIDAR Imagery and Aerial Photographs" (Madin and Burns, 2006);
- "Preliminary Geologic Map of the Oregon City Quadrangle, Clackamas County, Oregon" (Madin, in press).

We also reviewed the following, more recently published documents:

- Map showing faults, bedrock geology, and sediment thickness of west half of Oregon City 1:100,000 quad, Washington, Multnomah, Clackamas and Marion Counties, Oregon, 1998, IMS-4, Burns et al., (DOGAMI)
- *Oregon Geologic Data Standard v. 2.1,* 2009 (DOGAMI)
- *Geologic Map of the Oregon City 7.5’ Quadrangle, Clackamas County, Oregon*, 2009, GMS-119 (DOGAMI)
- *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs*, O-06-27, 2006 (DOGAMI)
- *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon*, IMS-26, 2009 (DOGAMI)

5.0 PRELIMINARY ENGINEERING GEOLOGY

According to Oregon City’s Geologic Hazards Checklist, a preliminary engineering geology report must be prepared that relates the following items to the actual development proposal:

- (5.1) A description of geologic formations, bedrock and surficial materials including artificial fill; location of any faults, folds, etc.
- (5.2) Structural data including bedding, jointing, and shear zones

- (5.3) Off-site geologic conditions that may pose a hazard to the site or that may be affected by on-site development
- (5.4) Cross sections showing subsurface structure, logs of subsurface explorations and analysis if necessary to evaluate the site
- (5.5) Signature and certification number of the engineering geologist
- (5.6) The report shall also contain a statement as to whether any hazard areas should not be disturbed because of the potential for damage to the site or neighboring properties
- (5.7) The report shall include specific comments resulting from their review of the civil plans for the project including recommendations on maximum cuts, structural fills, rockery walls, drainage behind any type of walls, maximum slopes above walls, removal of toe of slopes, the use of rock hammers and blasting, and so forth.

The above items are discussed individually in the following sections.

5.1 Geologic Description

Geologically, the site is located in the northern Willamette Valley, which consists of a structural trough between the Coastal Range and the Cascade Range. This basin is underlain by thick deposits of sand and gravel washed into it during the Pliocene epoch when the climate in the area was very dry. These granular deposits are locally covered by the Boring lavas (Qtb) in northwest Clackamas County.

Based on the *Oregon Geologic Data Standard v. 2.1* and Oregon Department of Geology and Mineral Industries *Geologic Map of the Oregon City 7.5' Quadrangle, Clackamas County, Oregon, 2009* this site is located within a geologic unit mapped as Tbc-Basalt of Canemah defined as flow or flows of grey medium-grained, olivine basalt. The Oregon Department of Geology and Mineral Industries (DOGAMI), Bulletin 99, *Geologic Map of the Canby and Oregon City Quadrangles, Oregon 1979*, maps the site as consisting of Boring lavas (Qtb), which it describes as Pliocene-Pleistocene lavas, light-gray, open-textured olivine basalt; flow structures common; includes some pyroclastic material of local extent; widely spaced joint pattern. Lavas and breccias have weathered to a residual red clay surface soil. Vertical exposures are susceptible to mass movement and deep bedrock sliding because of failure of underlying material (see the description below with clay materials within the Troutdale unit).

The Boring Lava deposits overly the Troutdale (Tpt), which are described as Pliocene sandstone and conglomerate; indurated beds and lenses of well-sorted sand and cobbly gravel with up to 30 percent quartzite clasts. Some sand originally composed of volcanic glass have altered to an impermeable high shrink-swell clay. The clay can be unstable and cause overlying competent units to fail by landslide. The publications indicate that on slopes where this clay layer daylights, one generally encounters a spring. Also, if layers dip out of the slope, it can become a failure

plane for a slump or slump-earthflow when the pore water pressure has built up to a critical value on top of the clay layer.

Based on the *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs, O-06-27, 2006* and the *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon, IMS-26, 2009,* a mapped landslide was identified adjacent to the site to the east. The landslide is identified as a prehistoric or ancient landslide (movement greater than 150 years ago). This is defined by landslide features that are slightly eroded and there is no evidence of historic (recent in last 150 years) movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

The borings completed for the previously referenced 2004 ZZA report are generally consistent with the above geologic mapping for the Boring Lavas/Basalt of Canemah, although the basalt has become deeply weathered in certain areas. The Troutdale unit was not encountered to the maximum depth of the borings at approximately 50½ feet below the ground surface. Although direct evidence of landslide features were not readily observed during our exploration programs for the 2004 report, we did observe the general headscarp area of the ancient landslide area during our 2012 slope reconnaissance with the aid of the recent Lidar-based landslide maps. An excerpt of the landslide map is appended as Exhibit A-2.

5.2 Structural Data

Bedrock outcrops or exposures were not observed during our site visits on the subject property or immediately downslope of the subject property. As discussed above, the bedrock in the site vicinity is mapped as Tbc-Basalt of Canemah defined as flow or flows of grey medium-grained, open-textured, olivine basalt. Flow structures are common, includes some pyroclastic material of local extent, and widely spaced joint pattern. Lavas and breccias have weathered to residual red clay surface soil. Vertical exposures are susceptible to mass movement and deep bedrock sliding because of failure of underlying material. The rock cores completed for the previously referenced 2004 ZZA report indicate close fracture spacing in the upper, weathered zones of the bedrock grading to wide fracture spacing in the fresh, competent bedrock at depth.

5.3 Off-Site Geologic Conditions

The *Map of Landslide Geomorphology of Oregon City, Oregon, and Vicinity Interpreted from Lidar Imagery and Aerial Photographs, O-06-27, 2006* and the *Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon, IMS-26, 2009,* indicate a mapped landslide area adjacent to the east side of the site. The landslide is identified as a prehistoric or ancient landslide (movement greater than 150 years ago). This is defined by landslide features that are slightly eroded and there is no evidence of historic (recent in last 150

years) movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

During our initial exploration period during 2001-2002, we performed a surface reconnaissance of the steep slope area on the eastern edge of the site and immediately downslope of the site to the east. We also re-visited these areas on July 31, 2012 to determine the current conditions. During our slope reconnaissance visits, we walked and mapped the landslide area. We identified a main head scarp along the eastern site boundary, followed by numerous (3 to 5) internal scarps further east of the site within the ancient mapped landslide itself. A spring was observed at the base of the head scarp approximately 100 feet east of the northeast corner of the site at approximately 350 feet in elevation. A second spring was observed approximately 150 feet east of the southeast corner of the site at approximately 290 feet in elevation. Four nick points (i.e., drops in the streambed from erosion) were observed in the stream bed at the base of the ancient landslide ranging in height from 1½ feet to 6 feet. Gray, stiff to medium stiff, wet, lean clay with cemented clasts of gray clay was observed at various points along the stream bed. These deposits can be correlated to the fine grained portion of the Troutdale formation described above. At the time of our site reconnaissance Terracon did not identify new slide areas immediately downslope of the proposed development.

Our field observations agree with the above-referenced published landslide mapping. We did not observe indications of recent movement during our slope reconnaissance during the 2001-2002 ZZA exploration programs and our recent site visit in July 2012.

5.4 Geologic Cross-Sections

Our interpretation of the site's geologic cross-section is shown in Exhibit A-3 of this report.

5.5 Signature and Certification Number of Engineering Geologist

The signature and certification number of the engineering geologist is provided on the report signature page after the front cover.

5.6 Disturbance of Hazards Statement

The geologic hazards of concern for the site development are the steep slope area and ancient landslide to the east of the site. This geologic hazard area should not be disturbed due to the potential for damage to the site and/or neighboring properties. An exception for disturbance would be the removal of invasive vegetation, such as blackberry bushes, and replanting with species suitable for erosion control purposes. After removal of the invasive vegetation, minor grading may necessary, such as bucket smoothing and track walking the slope with a tracked

excavator, to reduce erosion and help temporary and permanent ground cover (e.g., hydroseed, mulch, bark, plantings, etc.) become established on the slope.

5.7 Civil Plans Review Comments

We have reviewed the current civil grading plans. The current site development plans are described in the Section 3 of this report and do not propose to disturb the geologic hazard area. These plans were developed using the 2004 ZZA report recommendations as a guideline. According to these plans, the maximum permanent cuts are relatively low, on the order of 2 to 3 feet for the retaining walls along the north property line. Fills will be up to approximately 12 feet along the east retaining wall area for the proposed truck route, but this wall will be located outside of a top of slope setback of 35 feet. The retaining walls, drainage behind the walls, and maximum slopes above and below the walls will be engineered as part of future design work for the site, and will consider the weight of the fill and loads on the retaining structure on the stability of the slope area. Consideration of the wall type, bedrock conditions, and associated installation procedures will also be included in the retaining wall design. In our opinion, the proposed site development is feasible from a geotechnical perspective without adverse impacts on the stability to the adjacent slope.

6.0 PRELIMINARY SOIL ENGINEERING REPORT

According to Oregon City's Geologic Hazards Checklist, a preliminary soil engineering report must be prepared that relates the following items to the actual development proposal:

- (6.1) The engineering feasibility of the proposed development and addressing strength properties of surface and subsurface soils with regard to stability of slopes
- (6.2) Appropriate types of foundations together with bearing values and settlement criteria for foundation design, soil erosion potential, permeability and infiltration rates
- (6.3) Excavation, filling and grading criteria including recommended final slopes
- (6.4) Surface and subsurface drainage; planting and maintenance of slopes
- (6.5) Other identified soil or subsurface constraints together with geotechnical remediation and other recommendations to alleviate or minimize their effects; and signature and seal of the geotechnical engineer
- (6.6) The report shall also contain a statement as to whether the proposed development, constructed in accordance with the recommended methods, is reasonably likely to be safe and prevent landslide or other damage to other properties over the long term, and whether any specific areas should not be disturbed by construction.

- (6.7) The report shall include specific comments resulting from their review of the civil plans for the project including recommendations on maximum cuts, structural fills, rockery walls, drainage behind any type of walls, maximum slopes above walls, removal of toe of slopes, the use of rock hammers and blasting, and so forth.

The above items are discussed individually in the following sections.

6.1 Engineering Feasibility

In our opinion, the proposed site development is feasible from a geotechnical perspective. Exhibits A-4 and A-5 show our preliminary slope stability models for static and seismic conditions, respectively. The following soil parameters were used in our analysis.

STRATA	FRICTION ANGLE (DEGREES)	COHESION (PSF)	UNIT WEIGHT (PCF)
Proposed Structural Fill	32	0	125
Existing Fill: Silt w/Debris	27	0	120
Highly – Moderately Weathered Basalt	30	250	125
Slightly Weathered to Fresh Basalt	45	250	150
Possible Slide Material	5	100	120

These parameters were partly based on the direct shear test results reported in the 2004 ZZA report and partly based on our engineering judgment. A horizontal seismic coefficient of 0.13g was used in our analysis, which is approximately one-half of the design earthquake peak ground acceleration determined per 2009 IBC methods. The models indicate factors of safety greater than 1.5 and 1.1 for static and seismic conditions, respectively. Based on the slope stability model, the proposed retaining wall and fill are far enough away from the slope and have low effect on the slope stability at the site from a preliminary standpoint.

6.2 Foundation Types, Soil Erosion Potential, Permeability/Infiltration

The appropriate type of foundation for the proposed buildings are conventional shallow spread footings. Allowable bearing values of 2,000 psf for up to 1 inch of settlement may be used for planning purposes.

According to the USDA Soil Conservation Service, the erosion potential of the site soils are "slight" on the relatively flat areas of the site and "severe" on the steep slope areas east of the site. Permeability ranges from 0.6 to 2.0 in the sites soils, however, infiltration systems are not recommended due to the location of the site adjacent the steep slope area.

6.3 Excavation, Filling, and Grading Criteria

Recommendations for excavation, filling and grading are included in the 2004 ZZA report and may be used for preliminary purposes. This information will be updated in the final geotechnical report.

6.4 Other Soil or Subsurface Constraints

Due to the previous development at the site, including existing foundations and floor slabs, existing fill will likely be encountered during subgrade preparation for fills and foundations. Within the proposed building pad, we recommend that all existing fill be removed down to suitable native soils, and the backfilled with compacted structural fill as recommended in the previous section and the 2004 report. Overexcavation of the existing fill soils will also likely be necessary in the retaining wall area along the east retaining wall (truck route). Alternatives, such as partial overexcavation and replacement or the use of aggregate pier ground improvement, should be considered during the final geotechnical report phase.

6.5 Proposed Development Stability Statement

In our opinion, the proposed development should not adversely affect the stability of the slope nor increase landslide risk to other properties with the incorporation of the 35-foot development setback. Additional fill or loads should not be placed over the unstable steep slope areas. The preliminary setback from the top of slope is currently 35 feet, but this may change on examination of new data and analysis from upcoming exploration and testing. It should be noted that there are documented, existing, ancient and recent landslides further downslope of the property that may continue to move but will not be adversely impacted by the subject site development. One benefit to the site development will actually be control of surface water, which currently is not being controlled above the steep slope area.

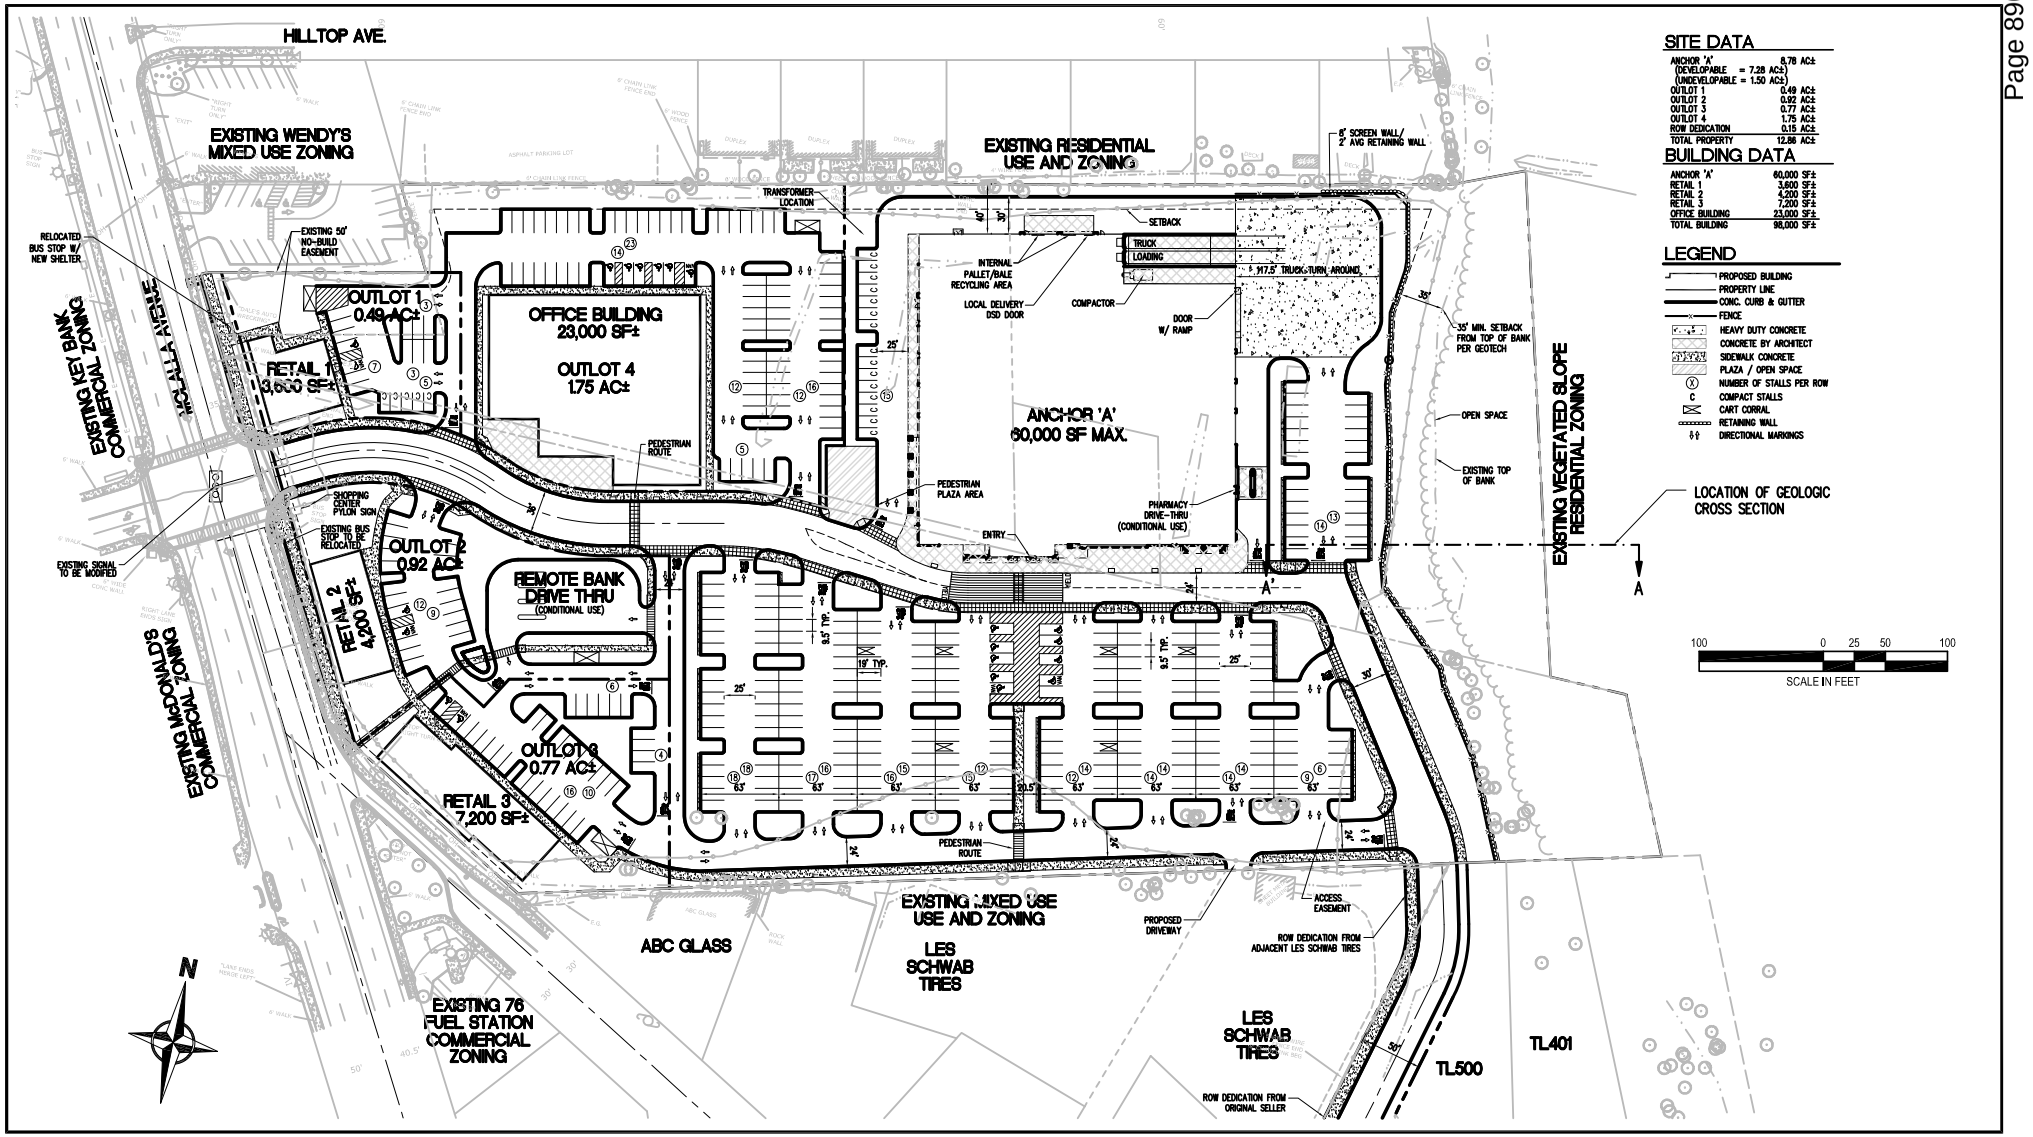
6.6 Civil Plans Review Comments

We have reviewed the current civil grading plans. The current site development plans are described in the Section 3 of this report and do not propose to disturb the geologic hazard area. These plans were developed using the 2004 ZZA report recommendations as a guideline. The maximum permanent cuts are relatively low, on the order of 2 to 3 feet for the retaining walls along the north property line. Fills will be up to approximately 12 feet along the east retaining

wall area for the proposed truck route, but this wall will be located outside of a top of slope setback of 35 feet. The retaining walls, drainage behind the walls, and maximum slopes above and below the walls will be engineered as part of future design work for the site, and will consider the weight of the fill and loads on the retaining structure on the stability of the slope area. Consideration of the wall type, bedrock conditions, and associated installation procedures will also be included in the retaining wall design. In our opinion, the proposed site development is feasible from a geotechnical perspective without adversely impacted the stability of the slope to the east.

7.0 GENERAL COMMENTS

Terracon should be retained to review the final design plans and specifications so comments can be made regarding interpretation and implementation of our geotechnical recommendations in the design and specifications. Terracon also should be retained to provide observation and testing services during grading, excavation, foundation construction and other earth-related construction phases of the project.



The analysis and recommendations presented in this report are based upon the data obtained from the borings performed at the indicated locations and from other information discussed in this report. This report does not reflect variations that may occur between borings, across the site, or due to the modifying effects of construction or weather. The nature and extent of such variations may not become evident until during or after construction. If variations appear, we should be immediately notified so that further evaluation and supplemental recommendations can be provided.

The scope of services for this project does not include either specifically or by implication any environmental or biological (e.g., mold, fungi, bacteria) assessment of the site or identification or prevention of pollutants, hazardous materials or conditions. If the owner is concerned about the potential for such contamination or pollution, other studies should be undertaken.

This report has been prepared in accordance with generally accepted geotechnical engineering practices for the exclusive use of PACLAND, and their respective successors and assigns, for specific application to the project location and stated purpose. No warranties, either express or implied, are intended or made. Site safety, excavation support, and dewatering requirements are the responsibility of others. In the event that changes in the nature, design, or location of the project as outlined in this report are planned, the conclusions and recommendations contained in this report shall not be considered valid unless Terracon reviews the changes and either verifies or modifies the conclusions of this report in writing.

LANDSLIDE ACTIVITY: Each landslide has been classified according to the relative age of last movement. This map display uses color to show the activity.

HISTORIC and/or ACTIVE (movement less than 150 years ago): The landslide appears to have moved within historic time or is currently moving (active).

PREHISTORIC or ANCIENT (movement greater than 150 years ago): Landslide features are slightly eroded and there is no evidence of historic movement. In some cases, the observed landslide features have been greatly eroded and/or covered with deposits that result in smoothed and subdued morphology.

REF: Landslide Inventory Map of the Northwest Quarter of the Oregon City Quadrangle, Clackamas County, Oregon (DOGAMI, IMS 26).

2021 Exploration

Exploration Number	Exploration Type	Exploration Depth (feet)	Location	
			Latitude	Longitude
21-B-1	Drilled Boring	90½	45.3363°N	122.5863°W

Exploration Layout and Elevations: Terracon personnel provided the exploration layout. Coordinates were obtained with a handheld GPS unit (estimated horizontal accuracy of about ±10 feet) and approximate elevations were obtained from Google Earth Pro data. If elevations and a more precise exploration layout are desired, we recommend explorations be surveyed following completion of fieldwork.

Subsurface Exploration Procedures: We advance soil borings with a truck-mounted drill rig using continuous flight augers (hollow stem or solid stem). Four samples were typically obtained in the upper 10 feet of each boring and at intervals of 5 feet thereafter. Soil sampling was performed using thin-wall tube and/or split-barrel sampling procedures. In the thin-walled tube sampling procedure, a thin-walled, seamless steel tube with a sharp cutting edge is pushed hydraulically into the soil to obtain a relatively undisturbed sample. In the split barrel sampling procedure, a standard 2-inch outer diameter split barrel sampling spoon is driven into the ground by a 140-pound automatic hammer falling a distance of 30 inches. The number of blows required to advance the sampling spoon the last 12 inches of a normal 18-inch penetration is recorded as the Standard Penetration Test (SPT) resistance value. The SPT resistance values, also referred to as N-values, are indicated on the boring logs at the test depths. The samples were placed in appropriate containers, taken to our soil laboratory for testing, and classified by a geotechnical engineer. In addition, we observed and recorded groundwater levels during drilling and sampling.

All explorations were supervised and logged by a field geologist who recorded field test data, classified soils, and collected the samples from the explorations. Our exploration team prepared field boring logs as part of standard drilling operations including sampling depths, penetration distances, and other relevant sampling information. Field logs include visual classifications of materials encountered during drilling, and our interpretation of subsurface conditions between samples. Final boring logs, prepared from field logs, represent the geotechnical engineer's interpretation, and include modifications based on observations and laboratory tests.

Upon encountering bedrock or refusal-to-drilling conditions, rock coring (using NQ/NX rock core barrel) was performed within select borings.

All explorations were supervised and logged by a field engineer or field geologist who recorded field test data, classified soils, and collected the samples from the explorations. Our exploration team prepared field boring logs as part of standard drilling operations including sampling depths, penetration distances, and other relevant sampling information. Field logs include visual classifications of materials encountered during drilling, and our interpretation of subsurface conditions between samples. Final boring logs, prepared from field logs, represent the geotechnical engineer's interpretation, and include modifications based on observations and laboratory tests.

Vibrating Wire Piezometer: We installed one vibrating wire piezometer (VWP) in boring 21-B-1 on December 17, 2021. The VWP was installed at a depth of approximately 30¾ feet below the ground surface (bgs), at the top of the intact, very low permeability, Boring lava (basaltic bedrock). This depth was determined by the project geotechnical engineer following completion of drilling. Prior to installation, the lower portion of the boring was filled with a bentonite chip-grout mixture and low-permeability grout was extended from approximately 35 feet bgs to about 1-foot bgs.

During installation, the VWP was taped to a one-inch diameter PVC pipe with the pressure sensor facing upwards. The VWP cable was taped to the PVC pipe on approximate 3-foot intervals as it was lowered into the boring. Once the VWP was at the target depth, a bentonite chip-grout mixture was placed from the bottom of the exploration to a depth of approximately 35 feet bgs. Then a low permeability grout was introduced to seal the upper portion of the exploration and allow the mini data logger to record changes in the vibrating wire frequency, and thus changes in pressure. The VWP wire was connected to a mini data logger housed within a steel, flush-mount wellhead. The mini data logger was set to record vibrating wire readings every 4 hours, starting December 20, 2021 at 5:00PM. Completion of the VWP is summarized in the following table:

Depth (feet bgs)	Description	Detail
0	Steel, flush-mount wellhead	Approximate 8-inch diameter and 18-inches tall
0 to 1	Void (open space)	––
1 to 35	Low permeability grout	50 PSI Grout for Medium to Hard Soils 30 gallon Water / 94 lb. Portland Cement
30¾	VWP piezometer installation	Geokon 4500S-350KPA (51psi)
35 to 90½	Bentonite chip-low permeability grout mixture	50 PSI Grout for Medium to Hard Soils 30 gallon Water / 94 lb. Portland Cement / 25 lb. Bentonite

Property Disturbance: We backfilled borings according to local jurisdiction requirements after completion of each exploration. Our services do not include repair of the site beyond backfilling our boreholes. Excess auger cuttings were dispersed in the general vicinity of each borehole. Since backfill material often settles below the surface after a period, we recommend boreholes be checked periodically and additional backfill added, if necessary.

Laboratory Testing

The project engineer reviewed the field data and assigned laboratory tests to understand the engineering properties of the various soil strata, as necessary, for this project. The following tests were performed for this project.

- ASTM D2216 Standard Test Methods for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
- ASTM D6913 Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis
- AASHTO T-267 Standard Method of Test for Determination of Organic Content in Soils by Loss on Ignition
- ASTM D1883 Standard Test Method for California Bearing Ratio (CBR) of Laboratory-Compacted Soils
- ASTM D6913 Standard Test Methods for Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis
- ASTM D1557 Standard Test Methods for Laboratory Compaction Characteristics of Soil Using Modified Effort
- ASTM G51 Standard Test Method for Measuring pH of Soil for Use in Corrosion Testing
- ASTM C 1580 Standard Test Method for Water-Soluble Sulfate in Soil
- ASTM G187 Standard Test Method for Measurement of Soil Resistivity Using the Two-Electrode Soil Box Method
- ASTM D2938 Standard Test Method for Unconfined Compressive Strength of Intact Rock Core Specimens
- ASTM D3080 Standard Test Method for Direct Shear Test Of Soils Under Consolidated Drained Conditions

The laboratory testing program included examination of soil samples by an engineer. Based on the material's texture and plasticity, we described and classified the soil samples in accordance with the Unified Soil Classification System.

Rock classification was conducted using locally accepted practices for engineering purposes; petrographic analysis may reveal other rock types. Rock core samples typically provide an improved specimen for this classification. Boring log rock classification was determined using the Description of Rock Properties.

Western portion of site, facing north

Central portion of site, facing west

SITE: 1367 Molalla Avenue
Oregon City, OR

LOCATION See Exploration Plan

Latitude: 45.3363° Longitude: -122.5863°

Surface Elev.: 429 (Ft.)

DEPTH	ELEVATION (Ft.)	Description	DEPTH (Ft.)	SAMPLE TYPE	FIELD TEST RESULTS
0.2	429	**ASPHALT**, moist			
1.0	428	**FILL - LEAN CLAY WITH GRAVEL (CL)**, medium to high plasticity, red, moist			
		FILL - POORLY GRADED GRAVEL WITH CLAY AND SAND (GP-GC), dark gray, moist Basalt boulder from 5 to 7 feet bgs	5		50/1"
7.0	422	**CLAYEY SAND WITH GRAVEL (SC)**, low to medium plasticity, red, white, and black, moist, very loose, residual soil	10		3-5-7 N=12 .25 (HP)
		nonplastic, gray, moist, very dense, probably heavily weathered rock	15		21-38-50/5" 1.75 (HP)
		basalt frgaments present	20		50/5"
			25		50/1"
30.5	398.5	vibrating wire piezometer installed at 30 ft bgs	30		50/5" RQD = 0%
		BASALT, gray, moist, sound, moderate spacing, unweathered, very strong	35		RQD = 88%
			40		RQD = 95%
			45		RQD = 92%
			50		RQD = 91%

STRENGTH TEST			WATER CONTENT (%)	DRY UNIT WEIGHT (pcf)	ATTERBERG LIMITS
TEST TYPE	COMPRESSIVE STRENGTH (tsf)	STRAIN (%)			LL-PL-PI

Stratification lines are approximate. In-situ, the transition may be gradual.
Vibrating wire piezometer installed at 30' bgs

Hammer Type: Automatic

Advancement Method:
Mud Rotary/Coring

Abandonment Method:
Boring Grouted with vibrating wire piezometer

See Exploration and Testing Procedures for a description of field and laboratory procedures used and additional data (If any).

See Supporting Information for explanation of symbols and abbreviations.

Elevation estimated from site topographic map

Notes:
Vibrating Piezometer installed at this depth

Serial No. 2146354

Zipper Zeman Associates, Inc. Geotechnical & Environmental Consultants	BORING LOG	Figure A-5
	Date Drilled: 10/31/01	Logged By: MJB

Test Pit TP-1
Approximate ground surface elevation: 425 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Duff over soft, damp, brown, SILT with trace fine sand. (Topsoil) Sparse fine roots to 1.2 feet and sparse medium roots to 2 feet.	S-1@0.5' MC=24%
1.0-3.0	Soft grading to stiff, damp, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles.	S-2@2' MC=16%
3.0-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown sandy silt with trace clay.	
	Test pit completed at 10.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-2
Approximate ground surface elevation: 435 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Duff over soft, damp to moist, dark brown, SILT with trace fine sand and occasional fine gravel. (Topsoil) Sparse fine roots to one foot and sparse medium to large roots to 2 ½ feet. Pocket penetrometer at 0.5 feet = 1.75 tons per square foot (tsf.)	
0.8-3.0	Soft grading to stiff, damp, orange-brown, SILT with trace clay, fine sand, and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders. Pocket penetrometer at 1.5 feet > 4.5 tsf.	S-1@1.5'
3.0-7.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown silt with trace clay to silty SAND. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2@3.5' MC=31%
	Digging refusal at 7.0 feet on a boulder on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-3
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Duff over soft, moist to wet, dark brown, SILT with trace fine sand and occasional gray, moderately weathered, round, basaltic andesite boulders. (Topsoil) Sparse fine to medium roots to 1.2 feet.	S-1@0.5' S-2@1.0' MC=41%
1.0-2.5	Soft grading to stiff, damp to moist, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 2.75 tsf.	S-3@2.0' MC=25%
2.5-11.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown sandy silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-4@10.5' MC=44%
	Test pit terminated at 11.5 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-4
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.3	Duff over soft, damp to moist, dark brown, SILT with trace fine sand (Topsoil.) Moderate to dense fine roots to 1.2 feet and sparse medium roots to 1.2 feet.	S-1@1.0' MC=36%
1.3-3.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.5 feet = 1.5 tsf.	S-2@2.5' MC=24%
3.0-11.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay.	S-3@6.0' MC=53%
	Test pit terminated at 11.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-5
Approximate ground surface elevation: 441 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Duff over soft, moist to wet, dark brown, SILT with trace fine sand (Topsoil) Moderate to dense fine roots to 1.0 feet and sparse medium roots to 1.2 feet.	S-1@0.5’
0.7-3.5	Medium stiff, damp to moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 3 feet > 4.5 tsf.	
3.5-7.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown sandy silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite boulders.	S-2@7.0’
	Test pit terminated at 7.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-6
Approximate ground surface elevation: 442 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Duff over soft, moist, dark brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine roots to 0.8 feet and sparse medium roots to 1.2 feet.	
0.7-3.5	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 3 feet = 2.0 to 2.5 tsf.	S-1@1.0’ S-2 @3.0’
3.5-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-3@5.5’
	Test pit terminated at 10.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-7
Approximate ground surface elevation: 443 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Short to medium length grass and blackberry vines over soft, moist to wet, dark brown, SILT with trace fine sand and occasional pockets of 3/8" minus crushed rock (Topsoil/FILL) Moderate to dense fine roots to medium roots to 1.2 feet.	S-1@0.5' MC=30%
1.0-3.5	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 3.75 tsf.	S-2@2.0' MC=21%
3.5-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional dark gray, subangular, slightly weathered, basalt with visible vesicles.	S-3@10.0' MC=56%
	Test pit terminated at 10.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-8
Approximate ground surface elevation: 443 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.2	Grass over soft, moist to wet, dark brown, sandy, gravelly SILT (Topsoil/FILL) Dense fine roots to 1.0 feet.	S-1@1.0'
1.2-4.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite boulders. Pocket penetrometer at 3.0 feet > 4.5 tsf.	
4.0-11.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2@10.5'
	Test pit terminated at 11.0 feet on 11/1/01. Slight groundwater seepage observed at 11.0 feet. No caving observed.	

Test Pit TP-9
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Short grass and blackberry vines over soft, moist to wet, brown, gravelly SILT with trace fine sand. (Topsoil/FILL) Moderate to dense fine to medium roots to 1.0 feet.	S-1@0.5’
0.7-6.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
6.0-10.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	
	Test pit terminated at 10.5 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-10
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines over soft, moist to wet, brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine to medium roots to 1.2 feet.	S-1@1.0’ MC=28%
1.0-3.0	Soft grading to stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
3.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-2@5.0’ MC=20%
	Test pit terminated at 11.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-11
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines over soft, moist to wet, dark brown, SILT with occasional gravel. (Topsoil) Moderate to dense fine to medium roots to 1.8 feet.	S-1@0.5 MC=32%
1.0-3.0	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@2.0' MC=29% S-3@5.0' MC=44%
3.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders. Test pit terminated at 11.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.	S-4@9.0' MC=59%

Test Pit TP-12
Approximate ground surface elevation: 444 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Short grass and blackberry vines over soft, moist to wet, brown, gravelly SILT with trace fine sand. (Topsoil/FILL) Moderate fine to medium roots to 0.9 feet.	S-1@1.0'
1.5-3.5	Soft grading to stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 1.75 tsf. Pocket penetrometer at 3.0 feet > 4.5 tsf.	
3.5-9.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders. Test pit terminated at 9.0 feet on 11/1/01. No groundwater seepage observed. No caving observed.

Approximate ground surface elevation: 445 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.5	Short grass and blackberry vines over soft, wet, brown, SILT with trace to some sand. (Topsoil) Moderate fine to medium roots to 1.5 feet.	S-1@0.3' MC=24%
0.5-3.0	Medium stiff grading to stiff, moist to wet, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@2.0'
3.0-6.0	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	
	Test pit terminated at 6.0 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-14
Approximate ground surface elevation: 447 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.5	Short grass and blackberry vines over soft, wet, brown, SILT with trace to some sand. (Topsoil) Moderate fine roots to 1.0 feet.	S-1@0.3'
0.5-4.0	Medium stiff to stiff, moist to wet, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@3.0'
4.0-5.5	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 5.5 feet on 11/2/01 due to equipment failure. No groundwater seepage observed. No caving observed.	

Test Pit TP-15
Approximate ground surface elevation: 447 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Grass over soft, damp to moist, brown, SILT with SILT and occasional gravel. (Topsoil) Moderate fine roots to 2.0 feet.	S-1@1.0' MC=27%
1.5-7.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
7.0-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown sandy silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2@9.0' MC=59%
	Test pit terminated at 10.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-16
Approximate ground surface elevation: 446 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine roots to 1.0 feet.	S-1@0.5'
1.0-4.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
4.0-7.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown sandy silt with trace clay.	S-2@6.0'
7.0-10.0	Medium dense to very dense, dark gray, moderately weathered, subangular to rounded, poorly sorted, vesicular basalt clasts in a matrix of medium stiff to stiff, damp, red silt with trace clay.	
	Test pit terminated at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-17
Approximate ground surface elevation: 447 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.7	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate to dense fine roots to 1.0 feet.	S-1@0.5' MC=26% S-2@1.0' MC=26%
1.7-3.0	Medium stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-3@2.5' MC=21%
3.0-7.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-4@5.5' MC=26%
7.0-10.5	Medium dense to very dense, dark gray, moderately weathered, subangular to rounded, poorly sorted, vesicular basalt clasts in a matrix of medium stiff to stiff, damp, red silt with trace clay.	S-5@9.5' MC=55%
	Test pit terminated at 10.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-18
Approximate ground surface elevation: 405 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Soft, wet, dark brown, SILT with some gravel, organic debris and roots. (Topsoil)	
1.0-7.0	Very dense, moderately weathered, sub-rounded basaltic andesite boulders in matrix of medium dense, moist, orange-gray, silty SAND to sandy SILT.	
	Test pit completed at 7.0 on feet on 11/2/01 with refusal on boulder. No groundwater seepage observed. No caving observed.	

Test Pit TP-19
Approximate ground surface elevation: 402 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Soft, wet, dark brown, SILT with some clay and sand, organic debris and roots. (Topsoil)	
0.8-2.5	Loose to medium dense, moist, orange-gray, silty SAND to sandy SILT with occasional cobbles and boulders of severely weathered basalt.	S-1@2’
2.5-7.5	Very dense basaltic andesite boulders from 2 to 8 feet in diameter in a medium stiff, sandy SILT matrix.	
	Test pit completed at 7.5 feet on 11/2/01 with refusal on boulder. No groundwater seepage observed. No caving observed.	

Test Pit TP-20
Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Grass over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine roots to 0.8 feet, sparse medium roots to 1.2 feet.	
0.8-2.5	Medium stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@1.5’ MC=28%
2.5-10.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional, gray, moderately weathered, round basaltic andesite cobbles and boulders.	S-2@4.0’ MC=56%
	Test pit terminated at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-21
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.3	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine to medium roots to 1.5 feet.	S-1@0.5’
1.3-9.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@2.0’
9.5-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-22
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Grass and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine and medium roots to 1.0 feet.	
1.0-6.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	
6.5-10.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-23
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.7	Wood debris and blackberry vines over soft, damp, brown, SILT with trace fine sand. (Topsoil) Moderate fine and medium roots to 1.0 feet.	S-1@0.5' MC=25%
0.7-6.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 1.75 tsf. Pocket penetrometer at 3.5 feet = 3.0 to >4.5 tsf.	S-2@1.5' MC=26%
6.5-7.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	
	Test pit terminated at 7.5 feet due to space constraints on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-24
Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Metal debris over soft, damp, brown, blocky, SILT with trace fine sand. (Fill) Trace fine roots to 0.7 feet.	S-1@0.5' S-2@1.0'
0.8-1.5	Soft to medium stiff, moist, brown, SILT with trace clay. (FILL)	
1.5-3.5	Soft to medium stiff to stiff, moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-3@2.5'
3.5-4.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	
	Test pit terminated at 4.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-25
Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.5	Wrecking yard debris over soft to medium stiff, damp, brown, SILT with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and wrecking yard debris. (Fill) Trace fine to medium roots to 1.0 feet.	S-1@0.5' S-2@2.0'
4.5-7.5	Medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
7.5-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3@10.5'
	Test pit terminated at 10.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-26
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.4	1-inch of asphalt over 3-inches of 5/8" minus crushed rock base.	S-1@0.5' MC=26%
0.4–1.1	Soft to medium stiff, damp to moist, brown, SILT with trace fine sand and occasional gravel (Topsoil prior to paving.) Trace fine to medium roots to 0.6 feet. Pocket penetrometer at 1.0 feet > 1.5 tsf.	S-2@1.0' MC=27%
1.1-4.5	Medium stiff to stiff, damp to moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders. Pocket penetrometer at 2.5 feet = A.5 tsf.	S-3@2.5' MC=37%
4.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay to silty SAND.	S-4@10.5' MC=46%
	Test pit terminated at 11.0 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-27
Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.6	Grass over loose, damp to wet, brown silty GRAVEL and wrecking yard debris. (FILL). Trace fine to medium roots to 1.6 feet.	S-1@0.5’
0.6–1.3	Soft to medium stiff, damp, brown, SILT with trace fine sand and occasional gravel (Relic topsoil)	
1.3-3.0	Medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@1.5’
3.0-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-28
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Blackberry vines over loose, damp to wet, brown silty GRAVEL and wrecking yard debris. (FILL) Trace fine to medium roots to 1.5 feet.	S-1@0.5' MC=16%
0.8–1.5	Soft to medium stiff, damp to moist, dark brown, SILT with trace fine sand and occasional gravel. (Relic topsoil)	S-2@1.0' MC=32%
1.3-3.2	Medium stiff to stiff, moist, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-3@2.5' MC=31%
3.2-8.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite and boulders.	S-4@6.0' MC=57%
	Test pit terminated at 8.5 feet on a boulder on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-29
Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.0	Grass over soft to medium stiff, damp to moist, brown, SILT with gravel and occasional asphalt debris. (Fill) Dense fine roots to 0.5 feet.	S-1@1.5'
4.0-7.5	Medium stiff to stiff, moist, orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@5.0'
7.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	
	Test pit terminated at 11.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-30
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.8	Grass and gravel over soft to medium stiff, damp to moist, brown, SILT with gravel and occasional asphalt debris. (FILL) Moderate fine roots to 0.3 feet. Occasional gray, moderately weathered, round, basaltic andesite boulders.	S-1@1.0’
1.8-6.0	Medium stiff to stiff, moist, orange-brown grading to red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
6.0-11.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 11.5 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-31
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-5.0	Grass and gravel over soft to medium stiff, damp to moist, brown, SILT with gravel and occasional asphalt debris. (FILL) Moderate fine roots to 1.1 feet.	
5.0-9.5	Medium stiff to stiff, moist, orange-brown grading to red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@6.0’ MC=25%
9.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2@11.0’ MC=53%
	Test pit terminated at 11.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-32
Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0–1.0	Blackberry vines over loose, damp to moist, dark brown, SILT with gravel and occasional metal debris. (Topsoil/FILL) Moderate fine to medium roots to 1.2'.	S-1@0.5' MC=11%
1.0-1.7	Soft to medium stiff, damp, light brown, SILT with trace sand and occasional gravel and metal debris. (FILL)	S-2@1.3' MC=25%
1.7-3.0	Medium stiff, damp, light brown, SILT with occasional asphalt and metal debris. (FILL)	S-3@2.5' MC=20%
3.0-4.7	Medium stiff, damp, reddish-brown, SILT with occasional fine to medium roots.	
4.7-9.0	Medium stiff to stiff, moist, orange-brown grading to reddish-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-4@7.5' MC=27%
9.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-5@9.5'

Test pit terminated at 11.0 feet on 11/2/01.
No groundwater seepage observed.
No caving observed.
Fill was from Molalla Avenue cut, approximately 50 years ago, according to Rocky Younger, property owner.

Test Pit TP-33
Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Short grass, blackberry vines, and metal debris over soft, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel. (Topsoil/FILL) Moderate fine to medium roots to 1.0 feet.	S-1@0.8’
1.0-5.5	Medium stiff, damp, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
5.5-11.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 11.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-34
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-2.0	Short grass and metal debris over medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@1.5’ MC=41%
2.0-12.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2@9.5’ MC=66% S-3@12.0’ MC=62%
	Test pit terminated at 12.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-35
Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Metal debris over loose, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel and wrecking yard debris. (Topsoil/FILL) Moderate fine and medium roots to 1.0 feet.	S-1@0.5’
1.0-3.5	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
3.5-10.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 10.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-36
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines and metal debris over soft to medium stiff, damp to moist, brown, SILT with trace fine sand and wrecking yard debris (Topsoil/FILL) Moderate fine and medium roots to 1.0 feet. Pocket penetrometer at 1.0 feet = 1.5 tsf.	S-1@1.0’ MC=29%
1.0-5.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Pocket penetrometer at 2.0 feet = 1.5 tsf. Pocket penetrometer at 2.5 feet = 2.5 tsf.	S-2@2.0’ MC=29%
5.0-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3@10.5’ MC=50%
	Test pit terminated at 11.0 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-37
Approximate ground surface elevation: 431 Feet

Depth (feet)	Material Description	Sample No.
0.0-5.0	Blackberry vines over soft to medium stiff, damp to moist, brown, SILT with significant large pieces of concrete and asphalt debris. (FILL) Moderate fine and medium roots to 1.4 feet.	S-1@1.0' MC=19%
5.0-8.0	Medium stiff to stiff, damp to moist, orange-brown grading to reddish-orange, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2@7.0' MC=35%
8.0-12.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3@10.0' MC=50%
	Test pit terminated at 12.5 feet on a boulder on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-38
Approximate ground surface elevation: 431 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines and short grass over medium dense, moist to wet, brown, silty sandy GRAVEL with significant asphalt debris (FILL) Moderate fine and medium roots to 0.8 feet.	S-1@0.5'
1.0-5.5	Soft to medium stiff, damp, orange-brown SILT with significant large pieces of asphalt and concrete debris. (FILL)	S-2@2.0'
	Digging refusal at 5.5 feet due on concrete debris on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-39
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Duff and asphalt debris over soft to medium stiff, damp to moist, orange-brown, SILT with some sand and occasional asphalt debris and 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-1@1.0' MC=46%
3.5-7.5	Soft to medium stiff, moist, brown, SILT with organics, and occasional wood and metal debris. (FILL)	S-2@4.0' MC=26% S-3@7.0' MC=28%
7.5-10.5	Medium stiff to stiff, damp to moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
10.5-13.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders.	S-4@11.5' MC=42%
	Test pit terminated at 13.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-40
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.9	Duff over soft, damp, brown, SILT with trace fine sand. (Topsoil) Sparse fine roots to 1.0 feet and sparse medium roots to 1.9 feet.	S-1@1.0' MC=23%
1.9-3.0	Medium stiff, damp, orange-brown, sandy SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders. Pocket penetrometer at 2.0 feet >4.5 tsf.	S-2@2.5' MC=21%
3.0-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders.	S-3@5.5' MC=21%
	Test pit completed at 10.0 feet on 11/3/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-41
Approximate ground surface elevation: 441 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Duff over soft, damp to moist, brown, SILT with trace fine sand and occasional gravel. (Topsoil) Moderate fine to medium roots to 1.2 feet and sparse large roots to 1.5 feet.	S-1@0.5-2.0' S-1A@0.5-2.5'
1.5-2.5	Soft grading to stiff, damp, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders.	S-2@2.5' MC=26%
2.5-6.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders.	S-3@5.5'
	Digging refusal at 10.0 feet on a boulder on 11/3/01. No groundwater seepage observed. No caving observed. Samples S-1 and S-1A were shelby tube samples.	

Test Pit TP-42
Approximate ground surface elevation: 432 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Soft to medium stiff, wet, brown grading to orange-brown, SILT with some sand, organic debris and roots to 3". (Topsoil)	
1.0-4.0	Soft grading to stiff, damp, orange-brown, SILT with trace clay and trace to some 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, rounded, basaltic andesite boulders.	
4.0-6.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to moist, reddish orange-brown silt with trace clay. Occasional gray, moderately weathered, rounded, basaltic andesite cobbles and boulders to 3 feet in diameter.	
	Test pit completed at 6.5 feet on 11/2/01. No groundwater seepage observed. No caving observed.	

Test Pit TP-43
Approximate ground surface elevation: 426 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Medium stiff, moist to wet, orange-brown, sandy SILT with some gravel, clay, and debris consisting of concrete, asphalt, crushed rock, and wire. (Fill)	S-1@1'
3.5-7.8	Soft to medium stiff, wet, dark gray-brown, SILT with some clay, sand and gravel. Occasional clasts of concrete, asphalt, brick and trace organic material. (Fill)	S-2@5'
7.8-8.0	Pine needles and thin branches to 1-inch in diameter. (Fill)	
8.0-11.0	Large andesitic boulder encountered at east end of test pit. Boulder appeared to be in a matrix of stiff to medium stiff, gray-brown SILT. (Fill)	
	Test pit completed at 11.0 feet on 3/4/02. Very slight seepage observed at 9 feet at time of exploration. No caving observed.	

Test Pit TP-44
Approximate ground surface elevation: 421.5 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.3	Grass sod.	
0.3-6.0	Soft to medium stiff, wet, orange-brown, sandy SILT with some clay and gravels. Occasional clasts of asphalt and concrete to 2 feet in diameter. 2-½ foot diameter andestitic boulder encountered at 1.5 feet. (Fill)	S-1@2'
6.0-8.0	Soft grading to stiff, wet, orange-brown, SILT with some clay and trace to some gray, sub-rounded clasts of severely weathered basaltic ardisite.	
8.0-11.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular to sub-rounded, poorly sorted basaltic andesite clasts in a matrix of medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay.	
	Test pit completed at 11.0 feet on 3/4/02. No groundwater observed at time of exploration. No caving observed.	

Test Pit TP-45
Approximate ground surface elevation: 433.5 Feet

Depth (feet)	Material Description	Sample No.
0.0-2.5	Soft grading to stiff, moist, orange-brown, SILT with trace to some clay, sand, and 3 inch minus fragments of severely weathered basaltic andesite.	S-1@1'
2.5-6.0	Very dense, damp, gray, moderately weathered andesitic boulders to 3 feet in diameter in a matrix of medium stiff to stiff, moist to wet, orange-brown, SILT with trace clay to silty SAND with trace clay. Boulders sub-angular to rounded.	
	Test pit completed at 6.0 feet with refusal on 6-foot diameter andesitic boulder. No groundwater observed at time of exploration. No caving observed.	

Test Pit TP-46
Approximate ground surface elevation: 438 Feet

Depth (feet)	Material Description	Sample No.
0.0-6.0	Concrete and asphalt debris with matrix of sandy GRAVEL with some silt (dirty crushed rock). Approximately 40% asphalt and 20% concrete based on visual estimation. (Fill)	
6.0-7.0	Soft to medium stiff, moist, orange-brown, SILT with some sand and clay.	
	Test pit completed at 7 feet on 3/4/02. No groundwater seepage observed at time of exploration. No caving observed.	

Test Pit TP-47
Approximate ground surface elevation: 435 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.2	Grass sod.	
0.2-3.0	Asphalt debris in matrix of sandy gravel with some silt (crushed rock). Approximately 40-50% asphalt based on visual estimation. (Fill)	S-1@1'
3.0-6.0	Medium stiff, moist, orange-brown, sandy SILT with some gravel and trace clay. (Fill)	
6.0-8.5	Soft grading to stiff, moist, orange-brown, SILT with trace to some clay, sand, and 3 inch minus fragments of severely weathered basaltic andesite.	S-2@4'
8.5-11.0	Very dense, damp, gray, moderately weathered andesitic boulders to 3 feet in diameter in a matrix of medium stiff to stiff, moist to wet, orange-brown, SILT with trace clay to silty SAND with trace clay. Boulders sub-angular to rounded.	
	Test pit completed at 11.0 feet on 3/4/02. No groundwater seepage observed at time of exploration. No caving observed.	

Test Pit TP-48
Approximate ground surface elevation: 433 Feet

Depth (feet)	Material Description	Sample No.
0.0-5.5	Stiff to medium stiff, moist to wet, orange-brown, SILT with some sand and trace clay and occasional clasts of asphalt and concrete. (Fill)	
5.5-10.0	Randomly oriented rebar reinforced concrete debris from 6 to 8 inches thick and up to 4 feet across. Approximately 5% of debris consisted of rebar, asphalt, and wire. (Fill)	
	Test pit completed at 10.0 feet on 3/4/02 due to refusal on large concrete debris. No groundwater seepage observed at time of exploration. No caving observed.	

Test Pit TP-1A
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-6.0	Duff and asphalt debris over very soft to medium stiff, moist, reddish-brown, SILT with some sand and occasional asphalt debris and 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-1 @ 0.5' S-2 @ 2'
6.0-9.0	Soft to medium stiff, moist, gray SILT with organic and metal debris and occasional cobbles of of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-3 @ 8'
9.0-12.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-4 @ 9.5'
	Test pit terminated at 12.0 feet on 03/01/2002. Slight groundwater seepage observed at 9.0 feet, perched on native soils. No caving observed.	

Test Pit TP-2A
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Duff over 7-inches of asphalt over 3-inches of 3/8-inch minus crushed rock base.	S-1 @ 1'
0.8-8.0	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-2 @ 8'
8.0-9.0	Soft, damp to moist, light gray to dark gray, SILT with trace clay and wood, metal, glass, and rubber debris. (FILL)	
9.0-11.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
	Test pit terminated at 11.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-3A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.3	Metal debris over soft, damp to moist, gray SILT with trace clay and occasional fine rootlets. Slight to moderate odor of oil impact. (FILL)	
0.3-7.5	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-1 @ 0.5' S-2 @ 2'
7.5-8.0	Soft, damp to moist, orange-brown silt with trace clay and fine rootlets. (Relict topsoil horizon)	
8.0-12.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	

Test pit terminated at 12.0 feet on 03/01/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-4A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Metal debris over 5/8-inch minus crushed rock base. Very strong odor of oil impact. Visible free product (appears to be crankcase oil) in crushed rock. (FILL)	S-1 @ 1'
1.5-8.0	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-2 @ 3' S-3 @ 7'
8.0-10.0	Medium stiff, moist, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	

Test pit terminated at 12.0 feet on 03/01/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-5A
Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Metal debris and grass over very soft, damp, gray SILT with trace clay and gravel. (FILL)	S-1 @ 1'
1.0-8.5	Soft to medium stiff, damp, reddish-brown SILT with trace clay with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	S-2 @ 8'
8.5-9.0	Loose, damp, brown-gray SILT with trace clay, occasional gravel and fine rootlets. (Relict topsoil horizon.)	
9.0-11.0	Medium stiff, damp, orange-red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	
	Test pit terminated at 11.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-6A
Approximate ground surface elevation: 431 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Blackberry vines and short grass over soft, damp, dark gray SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. (FILL)	
1.0-6.0	Soft to medium stiff, damp, red-brown SILT with occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and large pieces of asphalt and concrete debris. (FILL)	S-1@2.0'
6.0-6.5	Medium dense, damp, gray sandy SILT with some gravel. (FILL)	
	Digging refusal at 6.5 feet due on concrete debris on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-7A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.4	8-inches of asphalt over 8-inches of 3/8-inch minus crushed rock base. Very strong odors of gasoline and weathered gasoline. Gasoline dissolving asphalt.	
1.4-2.5	Soft, moist, red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and gravel. (FILL)	S-1 @ 1.5'
2.5-5.0	Soft to medium stiff, moist, red-brown SILT with trace clay and occasional 3-inch minus, gray angular fragments of severely to highly weathered, highly fractured basaltic andesite.	S-2 @ 3.5'
5.0-9.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-3 @ 6' S-4 @ 6.5'

Test pit terminated at 9.0 feet on 03/01/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-8A

Approximate ground surface elevation: 430 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Soft, damp to moist, dark brown SILT with trace clay and occasional gravel.	
1.0-3.5	Soft to medium stiff, damp, red-brown SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite and gravel.	S-1 @ 3'
3.5-7.5	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay	S-2 @ 6.5'

Test pit terminated at 7.5 feet on 03/01/2002.
Moderate groundwater seepage observed at 6.5 feet.
Slight caving observed below 6.5 feet.

Test Pit TP-9A
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Medium dense, damp, dark gray silty sandy GRAVEL with occasional cobbles. (FILL)	S-1 @ 1.5'
3.5-5.5	Soft to medium stiff, damp to moist, orange-red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 3.5'
5.5-9.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-3 @ 9.5'
	Test pit terminated at 9.5 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-10A
Approximate ground surface elevation: 440 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.5	Loose to medium dense, damp, gray-brown SILT with trace clay and trace fine sand and occasional fine highly weathered, highly fractured basaltic andesite gravel.	S-1 @ 1'
1.5-4.5	Soft to medium stiff, damp, orange-red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 2'
4.5-6.5	Medium stiff to stiff, damp, red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
6.5-7.0	Medium dense to very dense, gray, highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-3 @ 7'
	Test pit terminated at 7.0 feet on 03/01/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-11A

Approximate ground surface elevation: 448 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.8	Sparse grass and metal debris over 5/8-inch minus crushed rock base. (FILL)	
0.8-2.0	Soft to medium stiff, damp, gray, SILT with trace clay and occasional metal, rubber, and glass debris. Slight odor of weathered gasoline and slight staining observed. (FILL)	S-1 @ 1.5'
2.0-4.5	Soft to medium stiff, damp, red-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2 @ 3'
4.5-11.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay.	S-3 @ 5.5' S-4 @ 11'
	Test pit terminated at 11.0 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-12A

Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Grass and blackberry vines over soft, damp, dark brown, SILT with trace fine sand, trace clay and occasional gray, highly weathered, round, basaltic andesite gravel.	
1.0-4.0	Medium stiff to stiff, damp to moist, reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	
4.0-10.0	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, wet grading to damp, yellow silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-1 @ 4'
	Test pit terminated at 10.0 feet on 03/02/2002 Very slight groundwater seepage observed at 4 feet. No caving observed.	

Test Pit TP-13A

Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-1.0	Metal debris over loose, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel and debris. (Topsoil/FILL)	
1.0-4.0	Medium stiff to stiff, damp to moist, reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1@1'
4.0-9.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles.	S-2 @ 4.5' S-3 @ 9'
	Test pit terminated at 9.5 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-14A

Approximate ground surface elevation: 449 Feet

Depth (feet)	Material Description	Sample No.
0.0-2.0	Loose, damp, gray, SILT with trace clay and occasional pockets of 5/8-inch minus gravel and debris. Slight odor of oil impact to upper foot of soils, slight staining in upper foot of soils. (FILL)	S-1@1'
2.0-4.5	Soft to medium stiff, damp to moist, reddish-orange-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 2.5'
	Test pit terminated at 4.5 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-15A

Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.5	5/8-inch minus crushed rock base over soft to medium stiff, damp, gray brown, SILT with trace sand and occasional gravel and asphalt debris. (FILL)	S-1 @ 2'
4.5-7.5	Soft to medium stiff, damp, reddish-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 5'
7.5-9.5	Medium dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3 @ 8.5'
9.5-11.5	Dense to very dense, gray, highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, reddish-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-4 @ 11.5'
	Test pit terminated at 11.5 feet on 03/02/2002 No groundwater seepage observed. No caving observed. Cesspool cistern discovered at 1.5 to 5 feet. Test pit relocated to north of cistern, adjacent.	

Test Pit TP-16A

Approximate ground surface elevation: 451 Feet

Depth (feet)	Material Description	Sample No.
0.0-0.5	Soft, damp, dark brown, SILT with trace fine sand and occasional pockets of gravel. (Topsoil/FILL)	
0.5-2.5	Soft, damp, orange-brown grading to reddish-orange, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1 @ 2'
2.5-9.5	Medium dense to very dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-2 @ 5' S-3 @ 8.5'
	Test pit terminated at 9.5 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-17A
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-4.0	4-inches of asphalt over soft, damp, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1 @ 1' S-2 @ 3'
4.0-10.0	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay to silty SAND.	S-3 @5.5' S-4 @ 9'

Test pit terminated at 10.0 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

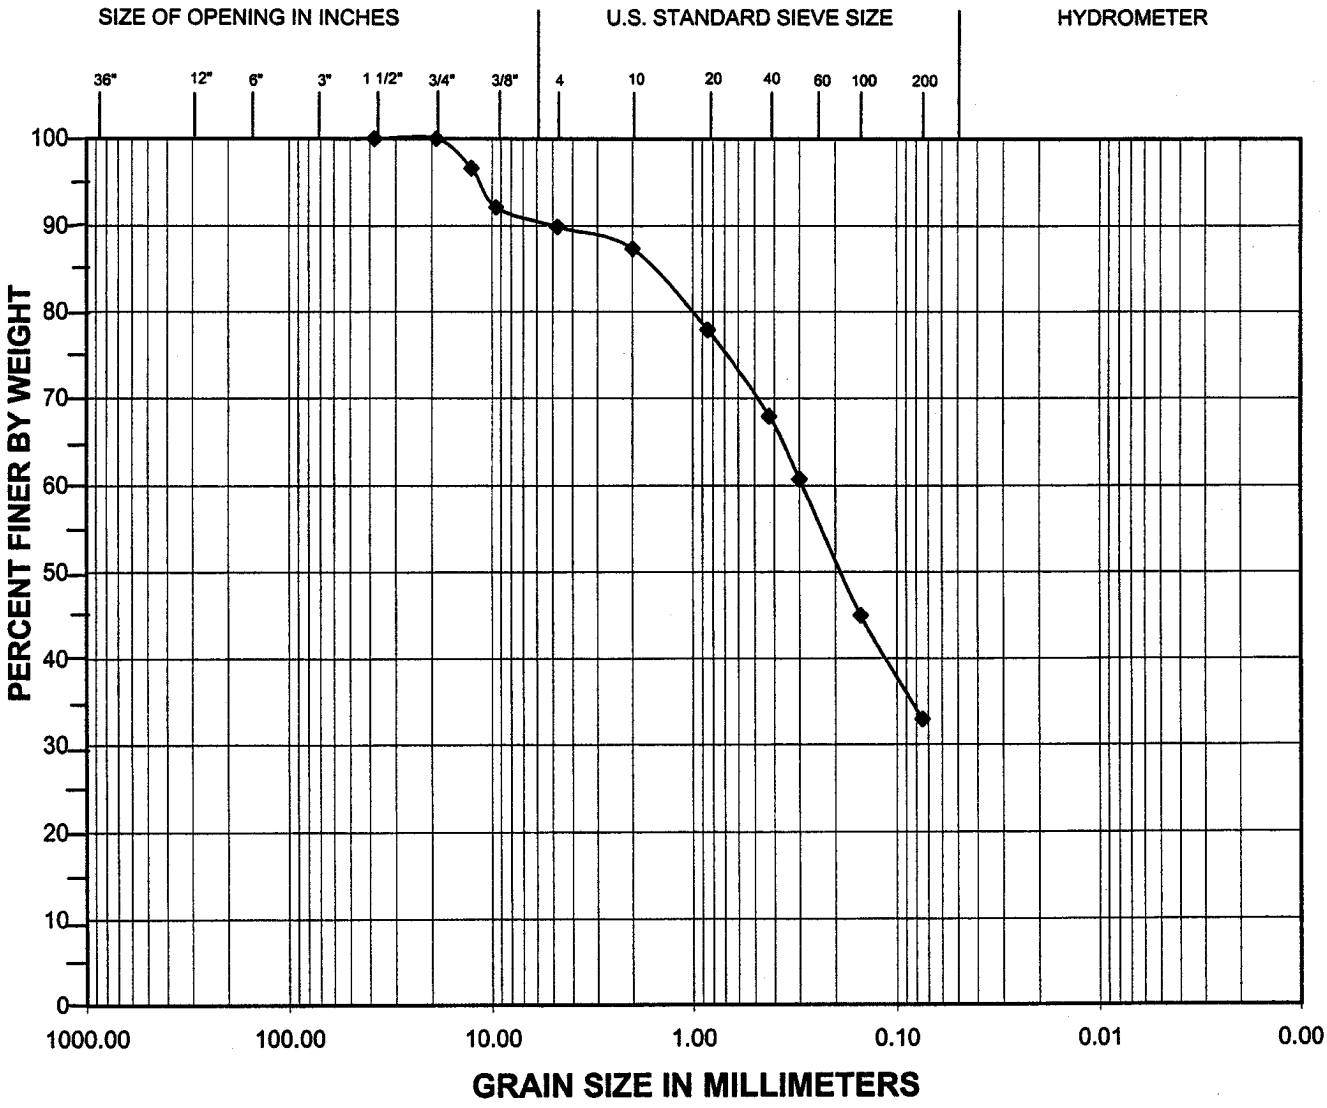
Test Pit TP-18A
Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-6.0	Broken asphalt over soft grading to medium stiff, damp, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-1 @ 3'
6.0-10.0	Medium dense grading to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay to silty SAND.	S-2 @ 6' S-3 @ 10'

Test pit terminated at 10.0 feet on 03/02/2002.
No groundwater seepage observed.
No caving observed.

Test Pit TP-19A

Approximate ground surface elevation: 451 Feet



Depth (feet)	Material Description	Sample No.
0.0-1.5	2-inches of 5/8-inch minus crushed rock over soft, damp to moist, dark brown-gray, SILT with trace clay, occasional gravel and occasional metal debris. (FILL)	S-1 @ 1'
1.5-5.0	Medium stiff to stiff, moist, orange-brown, sandy SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 3'
5.0-8.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-3 @ 7'
	Test pit terminated at 8.0 feet on 03/02/2002. No groundwater seepage observed. No caving observed.	

Test Pit TP-20A

Approximate ground surface elevation: 450 Feet

Depth (feet)	Material Description	Sample No.
0.0-3.5	Gravel over soft to medium stiff, damp, reddish-brown, SILT with gravel and trace clay and occasional asphalt debris. Occasional gray, moderately weathered, round, basaltic andesite boulders. (FILL).	S-1 @ 2'
3.5-4.0	Soft to medium stiff, damp, brown, SILT with trace clay and fine rootlets. (Relict topsoil horizon.)	
4.0-9.0	Medium stiff, damp, orange-brown grading to reddish-brown, SILT with trace clay and occasional 3-inch minus, gray, angular fragments of severely to highly weathered, highly fractured, basaltic andesite.	S-2 @ 4' S-3 @ 7'
9.0-10.0	Medium dense to dense, gray, severely to highly weathered, highly fractured, angular, poorly sorted, basaltic andesite clasts in a matrix of medium stiff to stiff, damp to wet, orange-brown silt with trace clay. Occasional gray, moderately weathered, round, basaltic andesite cobbles and boulders.	S-4 @ 9.5'
	Test pit terminated at 10.0 feet on 03/02/2002. Moderate groundwater seepage observed at 9.5 feet. No caving observed.

Terracon GeoReport

SAMPLING	WATER LEVEL	FIELD TESTS
Rock Core Grab Sample Standard Penetration Test	Water Initially Encountered Water Level After a Specified Period of Time Water Level After a Specified Period of Time Cave In Encountered Water levels indicated on the soil boring logs are the levels measured in the borehole at the times indicated. Groundwater level variations will occur over time. In low permeability soils, accurate determination of groundwater levels is not possible with short term water level observations.	N Standard Penetration Test Resistance (Blows/Ft.) (HP) Hand Penetrometer (T) Torvane (DCP) Dynamic Cone Penetrometer UC Unconfined Compressive Strength (PID) Photo-Ionization Detector (OVA) Organic Vapor Analyzer

DESCRIPTIVE SOIL CLASSIFICATION

Soil classification as noted on the soil boring logs is based Unified Soil Classification System. Where sufficient laboratory data exist to classify the soils consistent with ASTM D2487 "Classification of Soils for Engineering Purposes" this procedure is used. ASTM D2488 "Description and Identification of Soils (Visual-Manual Procedure)" is also used to classify the soils, particularly where insufficient laboratory data exist to classify the soils in accordance with ASTM D2487. In addition to USCS classification, coarse grained soils are classified on the basis of their in-place relative density, and fine-grained soils are classified on the basis of their consistency. See "Strength Terms" table below for details. The ASTM standards noted above are for reference to methodology in general. In some cases, variations to methods are applied as a result of local practice or professional judgment.

LOCATION AND ELEVATION NOTES

Exploration point locations as shown on the Exploration Plan and as noted on the soil boring logs in the form of Latitude and Longitude are approximate. See Exploration and Testing Procedures in the report for the methods used to locate the exploration points for this project. Surface elevation data annotated with +/- indicates that no actual topographical survey was conducted to confirm the surface elevation. Instead, the surface elevation was approximately determined from topographic maps of the area.

STRENGTH TERMS

RELATIVE DENSITY OF COARSE-GRAINED SOILS (More than 50% retained on No. 200 sieve.) Density determined by Standard Penetration Resistance		CONSISTENCY OF FINE-GRAINED SOILS (50% or more passing the No. 200 sieve.) Consistency determined by laboratory shear strength testing, field visual-manual procedures or standard penetration resistance		
Descriptive Term (Density)	**Standard Penetration or N-Value Blows/Ft.**	**Descriptive Term (Consistency)**	**Unconfined Compressive Strength Qu, (tsf)**	**Standard Penetration or N-Value Blows/Ft.**
Very Loose	0 - 3	Very Soft	less than 0.25	0 - 1
Loose	4 - 9	Soft	0.25 to 0.50	2 - 4
Medium Dense	10 - 29	Medium Stiff	0.50 to 1.00	4 - 8
Dense	30 - 50	Stiff	1.00 to 2.00	8 - 15
Very Dense	> 50	Very Stiff	2.00 to 4.00	15 - 30
		Hard	> 4.00	> 30

RELEVANCE OF SOIL BORING LOG

The soil boring logs contained within this document are intended for application to the project as described in this document. Use of these soil boring logs for any other purpose may not be appropriate.

Criteria for Assigning Group Symbols and Group Names Using Laboratory Tests [A]					Soil Classification	
					Group Symbol	Group Name [B]
Coarse-Grained Soils: More than 50% retained on No. 200 sieve	**Gravels:** More than 50% of coarse fraction retained on No. 4 sieve	**Clean Gravels:** Less than 5% fines [C]	Cu ≥ 4 and 1 ≤ Cc ≤ 3 [E]		GW	Well-graded gravel [F]
			Cu < 4 and/or [Cc<1 or Cc>3.0] [E]		GP	Poorly graded gravel [F]
		Gravels with Fines: More than 12% fines [C]	Fines classify as ML or MH		GM	Silty gravel [F, G, H]
			Fines classify as CL or CH		GC	Clayey gravel [F, G, H]
	Sands: 50% or more of coarse fraction passes No. 4 sieve	**Clean Sands:** Less than 5% fines [D]	Cu ≥ 6 and 1 ≤ Cc ≤ 3 [E]		SW	Well-graded sand [I]
			Cu < 6 and/or [Cc<1 or Cc>3.0] [E]		SP	Poorly graded sand [I]
		Sands with Fines: More than 12% fines [D]	Fines classify as ML or MH		SM	Silty sand [G, H, I]
			Fines classify as CL or CH		SC	Clayey sand [G, H, I]
Fine-Grained Soils: 50% or more passes the No. 200 sieve	**Silts and Clays:** Liquid limit less than 50	**Inorganic:**	PI > 7 and plots on or above "A"		CL	Lean clay [K, L, M]
			PI < 4 or plots below "A" line [J]		ML	Silt [K, L, M]
		Organic:	Liquid limit - oven dried / Liquid limit - not dried	< 0.75	OL	Organic clay [K, L, M, N] / Organic silt [K, L, M, O]
	Silts and Clays: Liquid limit 50 or more	**Inorganic:**	PI plots on or above "A" line		CH	Fat clay [K, L, M]
			PI plots below "A" line		MH	Elastic Silt [K, L, M]
		Organic:	Liquid limit - oven dried / Liquid limit - not dried	< 0.75	OH	Organic clay [K, L, M, P] / Organic silt [K, L, M, Q]
Highly organic soils:	Primarily organic matter, dark in color, and organic odor				PT	Peat

[A] Based on the material passing the 3-inch (75-mm) sieve.

[B] If field sample contained cobbles or boulders, or both, add "with cobbles or boulders, or both" to group name.

[C] Gravels with 5 to 12% fines require dual symbols: GW-GM well-graded gravel with silt, GW-GC well-graded gravel with clay, GP-GM poorly graded gravel with silt, GP-GC poorly graded gravel with clay.

[D] Sands with 5 to 12% fines require dual symbols: SW-SM well-graded sand with silt, SW-SC well-graded sand with clay, SP-SM poorly graded sand with silt, SP-SC poorly graded sand with clay.

[E] $Cu = D_{60}/D_{10}$ $\quad Cc = \dfrac{(D_{30})^2}{D_{10} \times D_{60}}$

[F] If soil contains ≥ 15% sand, add "with sand" to group name.

[G] If fines classify as CL-ML, use dual symbol GC-GM, or SC-SM.

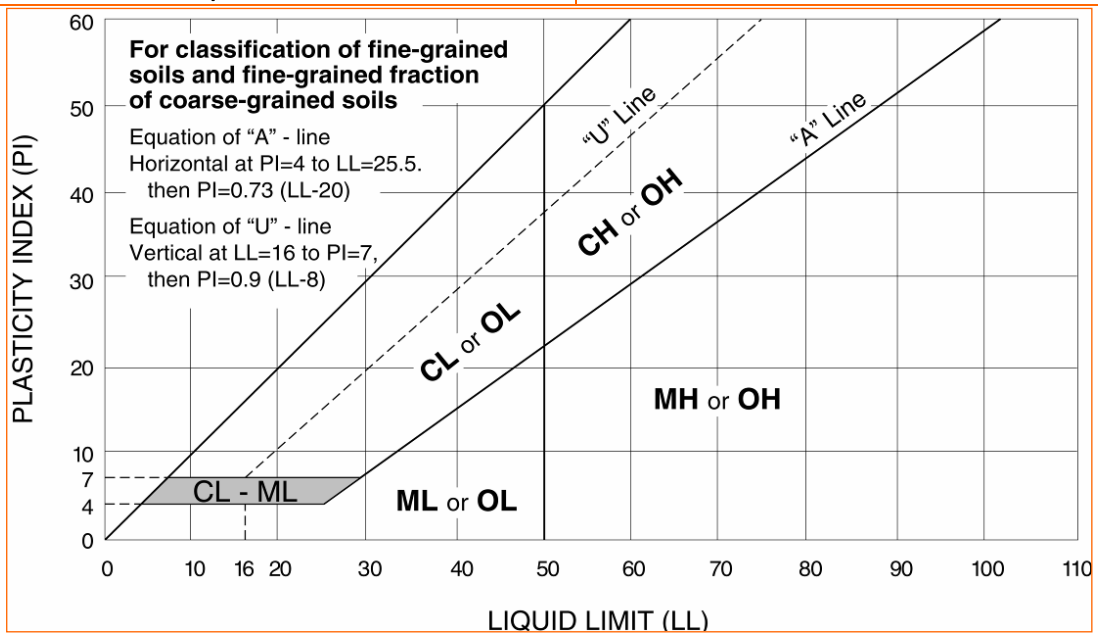
[H] If fines are organic, add "with organic fines" to group name.

[I] If soil contains ≥ 15% gravel, add "with gravel" to group name.

[J] If Atterberg limits plot in shaded area, soil is a CL-ML, silty clay.

[K] If soil contains 15 to 29% plus No. 200, add "with sand" or "with gravel," whichever is predominant.

[L] If soil contains ≥ 30% plus No. 200 predominantly sand, add "sandy" to group name.



[M] If soil contains ≥ 30% plus No. 200, predominantly gravel, add "gravelly" to group name.

[N] PI ≥ 4 and plots on or above "A" line.

[O] PI < 4 or plots below "A" line.

[P] PI plots on or above "A" line.

[Q] PI plots below "A" line.

WEATHERING	
Term	**Description**
Unweathered	No visible sign of rock material weathering, perhaps slight discoloration on major discontinuity surfaces.
Slightly weathered	Discoloration indicates weathering of rock material and discontinuity surfaces. All the rock material may be discolored by weathering and may be somewhat weaker externally than in its fresh condition.
Moderately weathered	Less than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a continuous framework or as corestones.
Highly weathered	More than half of the rock material is decomposed and/or disintegrated to a soil. Fresh or discolored rock is present either as a discontinuous framework or as corestones.
Completely weathered	All rock material is decomposed and/or disintegrated to soil. The original mass structure is still largely intact.
Residual soil	All rock material is converted to soil. The mass structure and material fabric are destroyed. There is a large change in volume, but the soil has not been significantly transported.

STRENGTH OR HARDNESS		
Description	**Field Identification**	**Uniaxial Compressive Strength, psi (MPa)**
Extremely weak	Indented by thumbnail	40-150 (0.3-1)
Very weak	Crumbles under firm blows with point of geological hammer, can be peeled by a pocket knife	150-700 (1-5)
Weak rock	Can be peeled by a pocket knife with difficulty, shallow indentations made by firm blow with point of geological hammer	700-4,000 (5-30)
Medium strong	Cannot be scraped or peeled with a pocket knife, specimen can be fractured with single firm blow of geological hammer	4,000-7,000 (30-50)
Strong rock	Specimen requires more than one blow of geological hammer to fracture it	7,000-15,000 (50-100)
Very strong	Specimen requires many blows of geological hammer to fracture it	15,000-36,000 (100-250)
Extremely strong	Specimen can only be chipped with geological hammer	>36,000 (>250)

DISCONTINUITY DESCRIPTION			
Fracture Spacing (Joints, Faults, Other Fractures)		**Bedding Spacing (May Include Foliation or Banding)**	
Description	**Spacing**	**Description**	**Spacing**
Extremely close	< ¾ in (<19 mm)	**Laminated**	< ½ in (<12 mm)
Very close	¾ in – 2-1/2 in (19 - 60 mm)	**Very thin**	½ in – 2 in (12 – 50 mm)
Close	2-1/2 in – 8 in (60 – 200 mm)	**Thin**	2 in – 1 ft. (50 – 300 mm)
Moderate	8 in – 2 ft. (200 – 600 mm)	**Medium**	1 ft. – 3 ft. (300 – 900 mm)
Wide	2 ft. – 6 ft. (600 mm – 2.0 m)	**Thick**	3 ft. – 10 ft. (900 mm – 3 m)
Very Wide	6 ft. – 20 ft. (2.0 – 6 m)	**Massive**	> 10 ft. (3 m)

Discontinuity Orientation (Angle): Measure the angle of discontinuity relative to a plane perpendicular to the longitudinal axis of the core. (For most cases, the core axis is vertical; therefore, the plane perpendicular to the core axis is horizontal.) For example, a horizontal bedding plane would have a 0-degree angle.

ROCK QUALITY DESIGNATION (RQD) [1]	
Description	**RQD Value (%)**
Very Poor	0 - 25
Poor	25 – 50
Fair	50 – 75
Good	75 – 90
Excellent	90 - 100

1. The combined length of all sound and intact core segments equal to or greater than 4 inches in length, expressed as a percentage of the total core run length.
